The Piron By-Product Coke Ovens

Italian Vertical Downward Combustion

Type Recently Introduced in This Country

—Results Obtained at Woodward, Ala.

A TYPE of by-product coke oven new to American practice has recently been in operation at an Alabama plant for demonstration purposes. The new ovens are the Piron, and 12 of them were constructed about a year ago at the Woodward Iron Co.'s plant, Woodward, Ala. They were built in conjunction with 18 Koppers ovens, having replaced 12 of the latter type in a battery of 30. The following description of the Piron ovens has been prepared from data furnished by the American Italian Commercial Corporation, 2 Rector Street, New York.

Description of the Ovens

The Piron ovens are of the general type of horizontal rectangular by-product coke ovens and constructed according to Mr. Piron's patent, U. S. 1,306,023. Their size has been adapted to the American standards, i.e., 16 to 18 in. in average width, 10 to 12 ft. in height, 39 to 42 ft. in length between the buckstays and 42 to 47 in. from center to center. They have been constructed of silica brick with a capacity for 12.5 tons of dry coal and can be built with a capacity up to 16 tons. Figs. 1 and 2 are cross sections of the side wall and the coke chamber. Fig. 3 is a general view of the ovens.

The most prominent characteristic is the continuous heating from the top downward, without inversion of any kind, and the continuous recuperation of heat instead of the usual regeneration.

The recuperator of heat is composed of joining rows of vertical flues (1) for air and (5) for burned gas. These rows are arranged alternately in such a manner that the wall between two rows is in contact with the burned gas from one side and with the air from the other side and transmits the heat continuously from the burned gas to the air. There are two, four or six rows of flues to each oven.

Situated below the rows of vertical flues of the re-

cuperator are horizontal channels (2) for fresh air and (8) for burned gas. The admission of fresh air is regulated by the registers (3) and the suction of the stack channel (9), by the registers (10), so that the regulation and the starting and stopping of operation of each oven is independent. Small orifices (4) and (7) located at the bottom of each vertical flue of the recuperator are intended to secure equal distribution of air and suction of burned gas without causing resistance in the higher part of the ovens.

The air drawn through the registers (3) in the horizontal channels (2) by the natural draught of the vertical flues (1), ascends in these flues growing hot, crosses the horizontal channel (11) and continues its way upward through the vertical air flues (12) provided in the bottle brick of the side walls; and then, upon reaching the upper part of these channels, it changes its direction and descends in the vertical heating flues of the side walls.

The gas is distributed in the heating flues by a distribution pipe (14) located above the oven, with branches (15) (one for each heating flue), through which inspection of the flue can be easily made. Coming into the upper part of the heating flue, the gas meets the hot air and burns while descending. The burned gas passes in the bottom channels through the orifices (13), then continues downward through the vertical flues (5) of the recuperator and passes through the orifices (7), the horizontal channel (8) and the register (10) to the stack channel (9).

The ovens are loaded through four charging holes and one coal larry if the standpipes are situated on the pusher end, or preferably, by two coal larries if the standpipes are situated in the middle of the ovens. The standpipes are 15 to 20 ft. high and are connected to the collecting main by movable elbows. Eventually two collecting mains are provided to separate the rich

The Piron Ovens As They Appear When Assembled, One Portion Being Left Out to Show Various Parts

gas obtained during the first period of distillation from the poorer gas produced later. The coke pusher and quenching cars are standard American make.

Qualities and Advantages

Melting is the most serious accident that can occur to a battery of coke ovens and it is chiefly caused by delaying the inversion. The suppression of the inversion in the Piron ovens does not mean only an easier management of operation but it guarantees against melting, it is claimed. Another device which prevents the danger of melting is the air flue provided in the bottle brick.

The ovens adapted to the American standard size for 12 to 12.5 tons of coal charge, needing only 90 tons of refractory brick per oven and having only a single waste gas channel and no inversion apparatus are less expensive than regenerative coke ovens. The larger size for 16 tons of coal charge weighs only 110 tons.

Theoretically, there is no reason why a recuperator should work differently than a regenerator of heat when both can be built with the same strength in regard to recuperation of heat. The reason why regenerators were preferred to recuperators was because of the leakage of air through the heat-transmitting walls of the recuperators. In the Piron ovens the resistance of the air and gas circuits are so small and the recuperators constructed in such a manner that it is claimed leakage does not occur.

The amount of heat, lost through the top of the ovens when they are heated upward from the bottom, is difficult to measure but is easy to observe. The top of such ovens are so hot that one cannot remain long on top of them. In the Piron ovens the fresh current of gas going downward from the top in the sidewall in an opposite direction to the current of heat going upward, carries this heat back in the sidewall and makes a perfectly cool top.

Regulation of Temperatures

The temperature of the upper part of the oven just below the arch is very important because too low a temperature prolongs the coking time and too high a temperature means a loss of by-products and causes the formation of large quantities of naphthalene. The temperature is very easy to regulate when the flame burns downward.

The sidewall being continuously heated by flames along the whole length and height, the transmission of heat is at its maximum during the whole coking time. This fact, together with the cooling of the bottle brick by the air current gives a cooler sidewall than the sidewalls of the regenerative ovens with the same coking time. The accessibility of the gas distribution the whole length of the sidewall is claimed as a guarantee of uniformity of temperature and another factor, which helps obtain this uniformity so important from the viewpoint of the coking time and saving of fuel gas, is the downward combustion.

Large Gas Surplus

The regularity of temperature, the easy transmission of heat through the sidewalls, the relatively low temperature of the sidewall in regard to the coking time, the short coking time, the small loss of heat through the top and stack, the non-admittance of fresh air in the ovens during inversion, or to burn the graphite, are all factors which are pointed to as making these ovens economical in regard to the fuel consumption and giving a larger amount of surplus gas.

The standpipes can be situated on these ovens the same as on every other type of oven and their size can be the same, but it is preferable to take off the gas from the center of the oven, because the lamp black formed at both ends, owing to the small air entrance through the doors remains mostly in the ovens and, therefore, the maintenance of the collecting main is easier.

The collecting main differs from that generally employed in that its section which is comparatively high and narrow so as to provide a better cooling through the high vertical sides and a more effective cleansing

Cross Section of the Coke Chamber

of the bottom, by the circulating tar. The recuperators, composed of rows of vertical chimneys situated below the sidewalls, are claimed to be an ideal foundation for ovens built in silica brick as they freely expand with the ovens without causing any break in the region of their bottom.

Some Results Obtained

The ovens built in this country work regularly with a coking time of less than 18 hr. and a consumption of 4000 cu. ft. of gas per hr. and sidewall, with an average width of 18 in. and a charge of 28,500 lb. of wet coal. Their minimum coking time is 14 hr. The temperature of the sidewall is only 2300 deg. Fahr. The temperature of the heated air is about 1000 deg. C. and that of waste gas about 350 deg. C., despite the fact that the recuperator could not be built its full height because of a high water level in the ground.

The gas is cooled by a primary and then a secondary cooling before the recovery of ammonia. The primary coolers are of the general type with vertical water pipes. The secondary coolers are mixture coolers from which the ammoniacal cooling water is cooled again in closed tube coolers. The cool gas before passing the exhausters is cleaned of tar by means of centrifugal cleansers which do not increase the resistance of the gas circuit and which operate continuously without need of cleaning. Exhausters of the general type are used but of smaller horsepower, as the resistance of the gas circuit is only about 32 in. of water.

Recovery of Ammonia

The direct process of recovery of ammonia by washing the gas with sulphuric acid was so successful that it will be surprising to find that the old indirect process is here used. Nevertheless, the results justified the change. The better yield of the latter does not depend directly upon the process itself, but upon the fact that the gas circulation is independent of the manufacture of sulphate. When the gas is not taken from the ovens with the greatest regularity a part of the gas passes directly in the sidewall and burns there without giving its by-products to the by-product plant. The loss of ammonia in the gas after passing through the scrubbers is less than 0.03 gr. per meter of gas, or 0.03 lb. per ton of coal, a quantity really too small to be considered.

Benzol and Light Oil Recovery

The recovery of benzol does not differ from any other system except in the type of still for distillation of light oil. For the refining of light oil a continuous operating rectifier is employed which can be built for very large quantities and gives any desired classification of products from the first flow, until almost pure

Cross Section of the Side Wall

benzol, toluol and xylol, whose chemical purification is, therefore, rapid and economical.

Year's Experience in Alabama

The experience from the use of 12 Piron ovens at the Woodward Iron Co.'s plant in Alabama is given in part as follows:

These ovens were built entirely of silica brick with the exception of the jamb brick and the horizontal channels below the recuperators, which were built of fire clay brick; the old buckstays, tierods, gas mains, etc., were not changed.

The coal used at Woodward contained a large amount of moisture and water was continually running from it on the way to the ovens. If some delay occurred in taking the coal from the bin water accumulated in the bottom of the bin and the next charge contained so much moisture that water sometimes ran out of the ovens through the bottom of the doors.

The 12 Piron ovens were operated within the schedule of 18 hr. pushing time and often they were pushed in 15, 14 and 13 hr. The thickness of the lining ($3\frac{1}{4}$ in.) was criticized at the beginning; nevertheless, it resisted satisfactorily.

Ovens Cooled and Reheated Without Damage

The fact that these ovens could be cooled and reheated again without damage was demonstrated in July when the battery was completely cooled in order to rebuild of clay the jams first built of silica.

Waste gas left the ovens at about 850° deg. Fahr. This should have been lower, but at Woodward there was the handicap of a high water level in the ground and the recuperators could not be built as large as desired.

The weight of the ovens at Woodward, charging 25,000 lb. of dry coal (28,500 lb. of wet coal) is 85 net tons of refractories. The size for 32,000 lb. of dry coal will weigh 100 tons. The recuperators form a substantial basement for the ovens, and the side walls proved to be very strong. The strength of the walls is attributed to the absence of horizontal channels on the upper part and to the cooled bottle brick holding well.

Yield of By-Products Not Yet Proved

The feature which has not as yet been proved is the yield of by-products, as the gas from all the ovens was mixed together before cooling, but it is well known that the yield depends upon the regulation of suction and pressure in the coke chamber and side walls. When there is practically no difference between the pressure in the side wall and the coke chamber, there is no loss of by-products by leakage of gas through the brick wall and the lighting power of the distilled gas is not lowered by suction of burned gas from the side wall. The difference between the pressure and suction at the bottom of the recuperators is less than 1 mm. of water.

RAILROAD TROUBLES

President Rea Tells How in His Opinion the Government Could Help

WASHINGTON, June 7.—Pointing out that the Government could materially assist the railroads in their present difficult situation by completing at once payments still due them from the Federal control, President Samuel Rea of the Pennsylvania Railroad, last week told the Senate Committee on Interstate Commerce of handicaps that are being faced by the carriers of the country. He said that under present circumstances the railroads must get the requisite financial results to allow them to exist by postponing all capital expenditures, but curtailing employment, by shutting down all possible activities on the road and in the shops and offices, by stopping the purchase and use of supplies, by postponing for the present even though they will cost more later, all maintenance or replacement expenditures except those requisite for safety. If the Government makes the payments immediately, it was stated, and the roads were allowed to issue 15-year obligations for the amounts spent by the Government for permanent improvements, as would have been done if the carriers themselves spent the money, their position would be greatly improved, Mr. Rea said.

Mr. Rea asserted that in spite of the promises of the President when the roads were taken over, the act of Congress and the contract with the carriers to the effect that the roads would be returned to their owners in as good condition as when they were taken over by the Government, the contention of the railroad administration was such as "result in theoretical maintenance only."

"The railroads believe that it can be shown that the same amount of physical reparation was not produced by the dollars expended in the Federal control period as in the test period, and therefore the pledge of the President and of Congress has not been made good," Mr. Rea stated.

Payments made to the railroads by the Treasury under the terms of the transportation act covering reimbursements of deficits during Federal control and as guaranty payments totaled \$404,949,233 up to June 1. In addition to this sum \$196,503,220 had been paid for loans from the \$300,000,000 revolving fund. While prompt payments such as are urged by Mr. Rea would, it is stated, mean increased purchases of steel and other materials, it is not believed a buying movement of any great proportions now is likely until the carriers have become adjusted further to a better financial basis. Trend in this direction is held to have been facilitated a great deal as the result of the action of the Railroad Labor Board in ordering a wage reduction of 12 per cent, effective July 1, of all railroad employees together with reclassification of workers. While the railroad brotherhoods and other representatives of employees are preparing to protest the reduction, it is believed that it will go into effect without any great difficulty and will mean that the carriers will have approached a point where they will be considerably nearer the time to enter the market for supplies. In its final report on deficiency in construction of homes, railroads, etc., the Senate Committee on Housing, of which Senator Calder is chairman, stated that an expenditure of \$6,000,000,000 will be required for railroad construction.

Until the financial condition of the railroads has improved it is claimed by railroad executives that there can be no general reduction in railroad rates, a subject, which, with a number of others concerning the railroad situation, was taken up by President Harding last week with members of the Interstate Commerce Commission, Director General Davis and Senator Cummins, chairman of the committee which is conducting the railroad inquiry.

The proceedings in the inquiry, with the closing of testimony from the railroad interests, now turns to the matter of taking evidence from shippers, representatives of railroad security owners and the employees.

FOUNDRY EXHIBITION IN 1922

A Return to the Old Practice of Holding Spring Meetings

The uncertainties which for some time have surounded the 1921 exhibition of the American Foundrymen's Association have been cleared up in a statement just issued by C. E. Hoyt, secretary, of the association, from its offices at 140 South Dearborn Street, Chicago. Both the time and place of the exhibition of this year have been under consideration and there has also been discussed the question of postponement. At a meeting of the executive committee of the association held in New York, May 28, it was decided to hold the next convention and exhibit in April or May at a place to be selected by the Committee on Convention and Exhibits. The statement of Secretary Hoyt is as follows:

"From the date of organization to 1911 the conventions of the American Foundrymen's Association were held in May or June of each year. In 1912 it was found necessary to postpone the convention scheduled for June at Buffalo until late in September, due to delay in completing the building in which the exhibits were to be placed, and since that time the annual meetings have been held in the fall.

"At the annual meeting of the board of directors of the association, in Rochester, N. Y., Dec. 7, 1920, invitations for the next convention were referred to the committee on convention and exhibits. When this committee met in Cleveland on March 30 to consider the place of the next meeting it was found that in none of the eight cities considered was it possible to find, during September or October, adequate hotel accommodations and exhibition facilities to properly care for such meetings as were held in 1919 and 1920.

"Confronted with this situation and taking into consideration general industrial conditions, the committee adopted a resolution recommending to the board of directors that the convention be held in New York in October or November of this year, without exhibits.

"This recommendation was referred by letter to the members of the board and expressions of opinion requested. On May 28 the executive committee of the board met and after due consideration of the recommendations of the committee and expressions of opinion by the members of the board, it was unanimously resolved that the next convention and exhibit of the American Foundrymen's Association be held in April or May, 1922, at a place to be selected by the convention and exhibits committee.

"With the hotels disposed to reserve a larger percentage of their rooms for a convention in the spring than in the fall, and with the probability that better exhibition facilities can be secured in the spring of 1922, it is hoped that no difficulty will be experienced in making satisfactory arrangements for the next convention and exhibit, the place and date of which will be announced later."

The Steel Treaters' Convention and Exhibition in September

Lt.-Col. A. E. White, national president of the American Society for Steel Treating, has made the announcement that Prof. H. L. Campbell, 1103 E. Huron Street, Ann Arbor, Mich., has been appointed chairman of the meetings and papers committee of the society, to secure papers for presentation at the Indianapolis convention and exhibition to be held Sept. 19 to 24. Associated with Professor Campbell on this committee are: George Q. Desautels, president Imperial Drop Forge Co., Indianapolis, Ind., and Victor Hillman, metallurgist, Crompton & Knowles Loom Works, Worcester, Mass.

The board of directors has authorized the awarding of a gold medal for the best paper presented at the Indianapolis convention and a silver medal for the second best paper. While the awarding of these medals for this year has been made to apply to those papers presented for this year's convention, the policy in

future years will be to award the medals to the first and second best papers presented before the society during the year, including local chapters.

Chairman Campbell has just issued a list of some of the subjects it is proposed to discuss at the convention, and the 3200 members of the society have been requested to prepare and submit papers either upon one of the subjects listed below or upon any subject of their own choosing. Already a large number of papers has been received, and many have indicated their intention to submit papers to the committee before the date of the convention.

"Inverted" Chilled Castings

BY C. A. HEISE*

An interesting phenomenon in foundry practice, for which no satisfactory explanations were forthcoming until recently, was frequently noticed in Germany during the war. Gray iron castings having a white core were often obtained in the ordinary sand casting process, thus exhibiting the typical feature of the chilled casting—but for the reversed order of layers, the chill being located inside the casting. Various reasons of a more or less satisfactory nature were advanced at the time in explanation of that phenomenon but on the whole no definite clues were ascertained pointing to the true causes of the trouble except the fact, that such "inverted" chilled castings, as they were termed, were almost invariably obtained whenever oxidized scrap was used at the foundry.

It was held by some authorities that the reversed order of layers was primarily due to a high content of phosphorus but this view proved incorrect, since the same feature was observed in castings, the analysis of which showed a normal phosphorus content. In all cases, however, the Baumann sulphur pressure test pointed to an exceptionally high sulphur content and a corresponding low carbon and manganese content and at last a clue was found. While sulphur usually occurs in form of manganese sulphide, the low manganese content of the castings caused the surplus sulphur to enter a chemical combination with the iron. Sulphide of iron, however, melts at 950 deg. C. and the separation of the gases when cooling down was found to prevent a separation of the graphite which in any case is already greatly reduced by the presence of sulphur. Owing to its relatively low melting point, the sulphide concentrates at the core of the casting, as the result of which white cast iron is produced.

With a view of counteracting the "inversion" effects, an increase of the manganese content is suggested since manganese sulphide has a higher melting point than iron, manganese or iron sulphide. An increase in the lime percentage as well as caution in the use of oxidized scrap is also recommended.

*Berlin, Germany.

Rev. Alva W. Taylor, professor in Columbia College, Columbia, Mo., who is touring the country under the auspices of the Interchurch World Workers, discussing the steel strike of 1919 before a large audience at Newport, Ky., on Sunday last, stated that the strike was not called for the purpose of securing an increase in wages, but to obtain collective bargaining agreements with the employers. In speaking of the request of President Wilson that the workers defer the strike, Mr. Taylor declared that the reason this was not done was that union leaders saw in the strike a chance to organize all steel workers.

The Chateaugay Ore & Iron Co. has engaged Freyn, Brassert & Co., engineers, Chicago, for the work of remodeling the blast furnace plant at Standish, N. Y., and for the construction of a Dwight & Lloyd sintering plant at mines at Lyon Mountain, N. Y. The sintering plant will supplement the ore concentrating plant and will produce a low phosphorus copper-free sinter for shipment to the blast furnace at Standish.

Sheet Rolling Mills at Baltimore

Built for Needs of Automobile and Furniture Trades—Top Rolls of Roughing Mills Driven by Independent Motor

ONE of the most modern specialty sheet mill plants for the manufacture of high grade sheets for the automobile and furniture trades and for other finishes is that of the Eastern Rolling Mill Co., Baltimore, which was put in operation in May, 1920. All departments are operated entirely by electric drives and are laid out so that there may be no lost motion in the moving of stock from one to the other. Possessed of excellent railroad and tidewater facilities, the site has further advantages by reason of the availability of labor and also electric power transmission from the Susquehanna River. Not alone does the location insure good service for the domestic market but it is strategically suitable for export trade as well.

The present equipment includes 12 finishing hot mills and eight stands of roughing mills, which are operated by two 1500-hp. General Electric motors and are of the National Roll & Foundry make. There are also 20 stands of cold rolls furnished by the Hyde Park Foundry & Machine Co., and driven through a Falk gear by a General Electric 800-hp. motor. The top roll of the roughing mills is driven by an independent motor with a reduction gear connection, thus doing away al-

together with pinions and top spindle drives. This device is the invention of Joseph Hirschmann, the engineer who built the plant.

All the mill buildings cover an area of 375 x 1000 ft. with the main bays of 80-ft. span and are of all-steel construction with roof of the Aiken type (high and low trusses with provision for greatly increased window space and ventilation, thus to provide a cool interior).

The mill is equipped with nine Chesapeake cranes, one of 5 tons, two of 10 tons, two of 15 tons, three of 25 tons, and one of 35 tons. Railroad spurs on both sides of the building give provision for unloading raw products and removing the finished steel. When working to capacity the mill is designed to turn out 6000 tons a month. Sheets are being made in widths of 18 in. to 48 in. and lengths up to 144 in.

As a nucleus for its working organization 90 per cent of the skilled men have been brought in from the Pittsburgh and Ohio districts. The remainder of the 1200 employees, when the plan is in full operation, come from Baltimore and vicinity. J. M. Jones, president, declared a first class type of workmen has been ob-

The Hot Mill is Driven by a 1500-hp. 250 r.p.m. 2200-volt Mill Type Motor

The Cold Rolling Mills
Are Driven by an 800-
hp. 375 r.p.m. 2200-
volt Mill Type Motor

tained and no housing troubles have been experienced.

The yard for storing sheet bars is in the southwestern corner of the hot-mill building. One of the railroad spurs runs directly into this part of the building, so that the raw material can be moved with ease to the mill floor.

There are 36 mill furnaces of George Hagan Co. make. They are stoker fired and equipped with pushers for charging the sheet bars. Of four Mesta picklers one is employed to treat the bars before heating.

A steam power plant consisting of two 250-hp. Heine boilers with brick stack 150 ft. high furnishes steam for the picklers and the acid vats.

The twelve stands of finishing mills are two-high 30-in. diameter rolls 34 to 54 in. long, contained in massive housings each weighing 42,000 lb., with screws 9 in. in diameter. The rolls are of chilled iron each weighing 15,000 lb. and equipped with a steam spraying and other devices for controlling the temperature of the rolls. The mills are mounted on massive con-

Balance Sheet Mill Drive of the Hot Mill

Annealing Department of the Eastern Rolling Mills

crete foundations supporting the cast iron shoe plates, which weigh 650 lb. per ft.

The two 1500-hp. General Electric motors which drive the hot mills operate at 250 r.p.m. and take 2200-volt alternating current. They are equipped with cast-iron bases and two steel-mill pedestals for carrying the bearings and are connected to the mills through single reduction Mesta made gear drives. The control for the motors is of the reversible automatic type, providing seven automatic current limit accelerating points and one plugging point (for quick stopping), both forward and reverse.

Maximum torque push buttons are provided, the use of which causes the proper contactors in the secondary circuits of the motors to close, thus enabling them to develop maximum torque at standstill in case the motors are stalled when trying to start with cold pieces of metal in the rolls or under similar cases of obstruction. An independent "stop" push-button station is employed from which the equipment may be shut down on occasions of emergency.

The annealing furnaces are of the double type, six in number, affording a capacity for 24 sheet annealing boxes. The cold roll department consists of 16 sets of finishing and four sets of flattening rolls made by the Hyde Park Foundry & Machine Co., and driven through a Falk gear by an 800-hp. General Electric induction

motor. The cold rolls are 26 in. in diameter and the housings for these rolls weigh 10 tons each.

A mechanical department consisting of machine shop, blacksmith shop and electric shop and equipped with tools and machines for performing all necessary repair work is on the north side of the cold rolling mill. The mill equipment also includes two scrap handling presses made by the Galland-Henning Mfg. Co., a 140-in. Hyde Park hot-mill shear, and a 144-in. Hyde Park shear for cutting cold sheets. Besides the large motors for operating the cold and hot mills previously mentioned there are 100 other General Electric motors. A prominent feature of the installation is that all of the motors in the mill are equipped with automatic starters and push-button stations. The substation equipment includes three 1667-kva. 3 phase, oil-insulated, self-cooled transformers, 13,200-2300-v, 25-cycle; three 200-kva, single phase, 25-cycle, 13,200-460-v transformers, three 25kva, single phase, 25-cycle, 13,200-115-v, lighting transformers; one 300-kw., 750 r.p.m., 250-v compound wound rotary converter, six-phase, with three 100-kva, 13,200-v-185-v transformers and one 5½-kw. motor generator for charging the storage batteries used in the operation of the oil switches, all of which are solenoid operated, remote control. A 22-panel switchboard completes the installation of the substations. All of the equipment is of General Elec-

Pickling Department of the Eastern Rolling Mills

tric make. The Eastern Rolling Mill Co. is capitalized at \$5,000,000, of which \$3,000,000 has been issued. J. M. Jones, president and general manager, was formerly president of the Baltimore Sheet & Tin Plate Co., which was bought by the Bethlehem Steel Co., with which he served as general manager of its sheet and tin plate department at Sparrows Point. Previously Mr. Jones was vice-president and general manager of the Massillon Rolling Mill Co., and at one time was general manager of the Lalance & Grosjean Mfg. Co.,

Harrisburg, Pa. Other officers are: C. E. F. Clarke, vice-president; L. J. Jones, secretary; J. A. Downey, treasurer; C. A. Pennock, general superintendent; J. E. Cook, assistant general superintendent; A. J. Hazlett, sales manager, and H. A. Thompson, assistant sales manager. The following constitute the board of directors: J. M. Jones, Waldo Newcomer, F. B. Cahn, F. W. Wood, L. J. Jones, J. T. Hill, C. C. Pusey, all of Baltimore; J. E. Aldred, C. E. F. Clarke, R. M. Smith of New York; and A. W. Thompson of Pittsburgh.

COAL-DUST HAZARDS*

Causes of Explosions in Industrial Plants— Preventive Action

Since the introduction of pulverized coal as a substitute fuel for natural gas in the various types of heating furnaces used in steel mills, a number of fires and explosions have occurred, resulting in the loss of life and property. L. D. Tracy, of the Bureau of Mines, has completed investigations of plants where such explosions occurred, with a view to learning causes and preventing future accidents.

What the Investigation Showed

A lack of knowledge of the explosive and inflammable qualities of pulverized coal was found to exist among some of those employed about the furnaces. Investigations revealed that a small stream of pulverized coal leaking from a defective joint in a coal transport line did not attract much attention, although if the dust cloud should come in contact with an open flame or hot metal the effects would be as disastrous as if it had been gas.

Experiments also demonstrated that a mixture of 30 per cent pulverized coal dust and 70 per cent of finely powdered shale is explosive. This is analogous to conditions which may be found in industrial plants, as they show that coal dust which may have settled on the floors and girders of buildings is not necessarily rendered inert by the incombustible matter with which it may have become mixed.

One of the most serious troubles with which users of pulverized coal have had to contend has been the prevalence of fires in storage bins for pulverized coal. It has been somewhat difficult to determine the exact cause of these fires, but undoubtedly spontaneous combustion has played an important part in the origin of some of them.

In some of the systems used in drying and pulverizing coal, the fine coal, about 90 per cent of which will pass through a 100-mesh screen and 70 per cent through a 200-mesh screen, is delivered to the storage bins at a temperature of 125 to 130 deg. F. It is possible, however, for the person running the drier to permit the fire to become hotter than normal and thus overheat the coal in the drier. The coal may be thus delivered to the storage bins at a temperature at or above 150 deg. If left in the bin for a comparatively short time, it is very probable that the temperature of the coal will rise to such a point that when mixed with air the coal will burn rapidly.

Overheating of the coal is especially likely to happen in the type of drier known as "direct heat" drier, where the fire on the grates is permitted to continue after the drier has stopped running.

What the Safeguards Are

In connection with the foregoing the following suggestions are made by Mr. Tracy: Care should be taken that pulverized coal is not delivered to storage bins at a high temperature. Storage bins for pulverized coal should not be placed in any position where they may become heated from furnaces, steam pipes or hot flues. If a plant has been shut down for several days, delivery of coal from the storage bins through transport lines to the place of consumption should not be permitted before the temperature of the coal is taken. This can be done by pushing iron rods into the interior of the stored coal.

It is of extreme importance to see that no opportunity is given burning particles to get into the transport line, either from the storage bin or by a "backfire" from the furnace. Frequent inspection should be made of the burners and any coked particles thereon should be immediately removed. As often as practicable, at night when the plant closes down if possible, all furnaces should be cut off the supply line, the gate from the pulverized fuel bin closed and the transport line thoroughly cleaned by allowing the fan to force a current of air through it until all the pulverized coal is blown out.

Where furnaces are equipped with individual fuel bins and the coal is delivered into the primary air line by means of screw conveyors, the fuel bins should be placed away from the furnaces. Every effort should be made to prevent any accumulation of dust in the building that houses the pulverizing apparatus. Certain manufacturing plants, in which explosive dust is prevalent, have installed vacuum cleaners to keep the buildings free from dangerous quantities of explosive dusts. In examining storage bins and other places where coal dust may exist, an electric light, protected by a wire guard, should be used.

To obtain the best results, as regards safety, in the use of pulverized coal as a fuel in industrial plants, it is important that both officials and men be educated to the idea that coal dust is explosive and therefore dangerous; and that under certain conditions it will ignite as readily as gas.

Organization of Technical War Service

In connection with the organization, under the direction of General Pershing, of the reserve armies of the United States, it is proposed informally to associate members of the Army Ordnance Association and the ordnance officers of the Reserve Corps. The Army Ordnance Association, of which Benedict Crowell is president, has as members some 2400 technical and business experts who, during the war, served either as officers of the Ordnance Department or as executives of industries engaged in ordnance manufacture. There will be a meeting at the Engineering Societies' Building, 29 West Thirty-ninth Street, at 8 p. m. June 15, to form in Greater New York a local organization of the Army Ordnance Association which shall include as members all ordnance officers of the Officers' Reserve Corps. All who served as officers in the Ordnance Department during the war, and all who are interested in ordnance as a factor in preparedness, are invited to attend.

A modern and completely-equipped club house and recreation grounds for the employees of the Electric Storage Battery Co., Philadelphia, are nearing completion. The employees will assume entire charge and responsibility for the club house and grounds, including the cost of maintenance. The equipment will provide for sports, entertainments, social gatherings, educational features and dining. The site is picturesque and the company has added artistic features.

The annual meeting of the National Sheet Metal Contractors of the United States will be held at the Fort Pitt Hotel, Pittsburgh, June 14 to 17, inclusive. The convention committee includes Louis Luckhardt, W. C. Markle, W. F. Angermeyer, W. J. Fortenbacher, E. W. Scarborough, S. N. Wilcox, D. E. Kendig, W. H. Scholes, J. S. Dougherty, John Graff and W. J. Keist.

New Type of Downcomers

A new type of downcomer has been patented by Arthur G. McKee & Co., Cleveland. It is noteworthy for being low and compact, as indicated by the accompanying drawing and the reproduced photograph of one of the actual installations.

The gas and particles of stock travel initially in the direction of the inclined outlet from the furnace, but the gas must then turn at a sharp angle from this direction in order to enter the vertical branch. Moreover, this gas must pass the baffle as indicated in the drawing. It has been demonstrated that the fine material, except the very small particles, strikes the end of the inclined pipe and rolls back into the furnace. It has been found in other words that the diverted flow of gas has not sufficient carrying power to cause a

How the McKee Downcomer Looks in Place Is Shown and the Phantom Drawing Shows It in Cross-Section

change upward from its original direction of the fine stock in suspension.

The high downcomer was of course constructed to reduce to a minimum the amount of stock thrown out of the furnace, especially during slips. The McKee company emphasizes that in comparison with the new downcomer the high types are expensive in material and construction and in obstructing the space on the furnace top, and they perform their service of reducing the amount of material lost by forcing the stock to travel upward as far as practicable—in short, depending on the length of the upward movement to bring about a gravity separation.

Completes Purchase of Steel

The American-Foreign Steel Corporation, Grand Central Terminal Building, New York, announces that it has completed the purchase of all the steel remaining in the United States, which was purchased for export to France during the war, consisting of billets of various sizes, sheet bars, rods, angles, beams, steel bars, plates, puddled iron, Bessemer and foundry pig iron, etc., amounting in all to about 70,000 tons. The material is located at Marietta, Baltimore, Army Base-Norfolk, Army Base-Kearney, and other Atlantic sea-ports.

Cost of Living Declining

Figures of the Bureau of Labor Statistics show that, while rents in May were higher than at any time during 1920, all other items of the family budget have decreased. The report is for five cities—New York, Chicago, Philadelphia, Detroit and Cleveland—having, in 1920, a total of 11,936,051 inhabitants, or 11.3 per cent of the population of the United States. Averages for these five cities show that food, clothing and house furnishings were higher last June than in any other month quoted; while fuel and lighting and the miscellaneous list were highest in December. Basis is 100 for December, 1914.

Item	Per Cent of Total Expenditure	Index of Expenditure		
		June, 1920	Dec., 1920	May, 1921
Food	38.2	216	172	140
Clothing	16.3	312	275	237
Housing	15.3	142	163	171
Fuel and light ..	5.2	171	193	184
Furniture, etc. ...	4.9	289	276	235
Miscellaneous	20.1	212	223	221
Totals		220	204	183.6

Duplex Planing Tool

A tool for metal planers containing two regular high speed tool bits and so constructed that a chip can be cut, not only during the regular cutting stroke but also during the return stroke has been placed on the market by the Waltham Machine Co., Waltham, Mass. This tool, known as the Dusenbury duplex planing tool, is used to equal advantage in the different operations of planing, such as horizontal, vertical, or inclined surfaces, also slots and dovetail bearings.

The position of the tool bits is such that the result is the same as that which is obtained when using an underhung tool. All surfaces subjected to wear are hardened. To use the tool, the planer clapper must be fastened down. The recommended practice is to put a taper pin through both the clapper box and clapper, near the lower end. By so doing the planer head is in no way injured and the taper pin is easily removed when required. Another way, when the planer has not been drilled and reamed for pin, is to clamp a Dusenbury clapper bracket under the clapper box swivel, clamping bolts and tightening a jack screw brace between the bracket and the lower tool clamping strap.

The tool bits, set facing each other, are clamped in two opposed clappers hung in the tool head, which can, when the bind nut at the top of the

tool shank is loosened, be swiveled in a sidewise direction and by means of the adjusting screws which bear against the graduated foot of the tool shank, any desired position is obtained. This motion swings the cutters by each other and the amount they are moved regulates the thickness of the chips and the amount of feed needed, so that each tool will have an equal cut or one may be given a heavy roughing cut and the other, set slightly lower, a light one for finishing.

All parts of the tool are case hardened and are interchangeable.

Two High Speed Tool Bits Are Used, the Cutting Being Done on Both Forward and Return Stroke

Automatic Nut Tapping Machine

The Anderson Die Machine Co., Bridgeport, Conn., is putting on the market a double spindle automatic nut tapping machine which represents a departure from previous designs. Instead of the clutches, a gear segment meshing into a train of gears and oscillated back and forth by a crank motion is used for advancing and reversing the tapping spindles.

The throw of the crank is adjustable to give any desired number of revolutions to the spindles in either direction, within the capacity of the gear train and the length of segment. The machine illustrated is geared to give 15 revolutions of the tap, which on a 32 pitch tap will give at least 10 complete threads through a thickness of 5/16 in., although the machine is designed and built for use on work not exceeding 3/16 in. The crank motion which controls the oscillation of the seg-

Adjustable Cams Operate the Feeding Mechanism. The general arrangement of the mechanism is shown in top view at the right

ment should never be any greater than actually necessary for the complete tapping of the nut.

The crank disk is mounted on the horizontal shaft running through the machine and is driven by a worm gear inclosed in an oil-tight case, the worm being driven by a constant speed motor running at 1750 r.p.m. The horizontal shaft and crank runs at 56 r.p.m., the spindles completing 56 cycles per min. which for two spindles gives 112 pieces tapped per minute. In machines intended for work up to 6/32 in., in brass, a worm and wheel can be furnished to give 68 cycles or 136 pieces tapped.

The horizontal shaft carries the cams for operating the feeding mechanism. The cams are adjustable so that the machine may be timed accurately and as the cam and crank disk are on the same shaft the timing of the feed with the direction of rotation of the spindle will remain accurate. The hopper will feed either hexagon or square nuts. Push rods carry the nuts from the feeding position in the chutes into engagement with the taps. The construction of the chute is intended to eliminate possibility of nuts leaving the chute until they are completely tapped. The hopper is provided with an agitator in the form of a disk which oscillates through a crank motion mounted on the horizontal shaft. A vibrator is also provided to prevent the nuts from sticking in the chutes during transfer.

The machine will tap square or hexagon nuts ranging from 3/16 to 1/2 in. across flats and from 1/16 to 3/16 in. in thickness, from the smallest diameter tap up to 10/24 without providing special chutes and at the rate of 112 pieces per minute. No special taps are required. In tapping nuts of various sizes the only change necessary is in making two small blocks that form the entrance for the nut into the chutes, two push rods of cold rolled steel 1/2 in. square and approximately

4 in. long, and two fingers that hold the nut while it is being transferred from the feeding position of the chute into engagement with the tap.

The machine is driven by a 1/4 hp. standard motor, alternating or direct current. The floor space required is 18 x 24 in.; the height from floor to spindle being 43 1/4 in., and the overall height, 66 in. An oil pump and reservoir are built into the machine. The net weight is 500 lb.

British Trade in Machine Tools

The British Board of Trade has issued a report on that country's export and import trade in machine tools, showing that exports for the first three months of this year were the largest on record for any similar period, greatly exceeding the pre-war average. The total weight of the machine tools exported from Great Britain in the first quarter was 7231 tons and the value £1,046,605 sterling. The 1911-1914 pre-war average was 3826 tons, value £282,964 sterling.

The total tonnage of imports during the same period dropped considerably from preceding years, though it was greater than the pre-war average of imports. The total for the three months was 1454 tons, value £377,-

447 sterling, compared with 3171 tons, value £705,226 in the corresponding period of 1920. The pre-war average, 1911-1914, was 828 tons, value £80,335.

Trade Commissioner Wilbur J. Page, in transmitting this report from London to the Bureau of Foreign and Domestic Commerce, comments as follows on the report: "In these days of trade depression it comes as rather a surprise to note the strides which the British machine-tool industry is making in the expansion of its export market. The statistics indicate that Great Britain has not only regained all lost ground in the production and export of heavy machines, but is also extending its trade in the finer machines, which are of much higher value per ton."

At the meeting of the Rail Steel Products Association, which includes the leading rerolling mills in the United States and Canada, held at the Hotel Biltmore on Friday, May 27, the following officers were elected: E. E. Hughes, vice-president Franklin Steel Works, president; D. E. Sawyer, sales manager Pollak Steele Co., secretary; Arthur S. Hook, vice-president Calumet Steel Co., treasurer.

The June meeting of the members of the National Association of Sheet and Tin Plate Manufacturers was held at Wheeling, W. Va., June 6 and 7. The Wheeling Steel Corporation acted as host for the visitors, and obtained for the meetings the use of the Country Club at Wheeling.

DECREASED PRODUCTION

Steel Production of Independents Less Than 20 per cent in Mahoning Valley

YOUNGSTOWN, OHIO, June 7.—Steel production with independent interests in the Mahoning Valley is less than 20 per cent of normal this week. A severe recession is noted in sheet mill production, which has declined to 18 per cent, with only 20 of the 105 mills of the Valley under power.

Grace blast furnace of the Brier Hill Steel Co. has been blown in, after a suspension of three weeks. There are now only nine stacks out of 46 pouring in the Mahoning and Shenango Valleys—two of the Carnegie Steel Co. at the Ohio Works, Youngstown; two of the same interest at the New Castle plant; two of the Youngstown Sheet & Tube Co. at its East Youngstown group, and one of the Republic Iron & Steel Co. in the Haselton group.

For the first time since the depression started, not a rolling mill of the Trumbull Steel Co. at Warren is under power. Aside from the Youngstown Sheet & Tube Co., idle the past week to a large extent and therefore under an accumulation of orders, other important independent groups are doing little better than the Trumbull interest. Only 16 of the 51 independent open-hearth furnaces are charged, or a total of 26 out of 66, including the Carnegie Steel Co. units. Six of the 17 pipe furnaces are fired; none of the four plate mills is active, while all of the independent bar mills are idle.

The Carnegie company is maintaining blast furnace, open-hearth and Bessemer production at its Youngstown district plants sufficient to support fully 40 per cent finishing schedules. The bar mills at the McDonald and Upper and Lower Union mills are partially operating.

Though the Newton Steel Co. has reduced the number of its active sheet mills from ten to eight, the company is endeavoring to maintain the same production rate on the smaller number of units. Other sheet mills are being operated by the Republic company, which has six under power at its Niles plant, and by the Brier Hill company, which has six in commission.

At its Girard plant, the A. M. Byers Co., Pittsburgh, is operating 22 puddling furnaces and a skelp mill.

Plant Operations

The Worcester Electric Tool Corporation, Worcester, Mass., which recently increased its manufacturing space, plans to expand its business 50 per cent. The company is manufacturing a combination electric drill and valve grinder.

The Universal Winding Co., South Auburn, R. I., plant has gone on full time with 1025 employees. Some departments have been on a three-day per week schedule. Prior to the business depression the company employed approximately 1600.

The new 90 x 320 ft. Smith Springfield Body Co., West Springfield, Mass., plant unit is expected to be finished June 15. When completed the plant capacity will have been increased 50 per cent. An additional 100 employees will be taken on. The company at present is employing 150 hands.

The Osgood Bradley Car Co., Worcester, Mass., has taken additional orders for more than 31-man electric cars from Detroit and Elmira, N. Y., roads at a total cost of approximately \$250,000. The company now has sufficient business on its books to keep its plant running at present capacity until fall. Some 950 employees are on the payroll.

The summary of the monthly employment survey made by the Cleveland Chamber of Commerce shows a slight increase in employment in that city. On May 1 there were 20,330 employees in 41 plants engaged in the manufacture of iron and steel and their products as compared with 19,434 on April 30, or a gain of 4.6 per cent. The number of employees in eight automobile and automobile parts plants increased from 9949 on April 30 to 10,310 on May 31, or a gain of 3.6 per cent.

The Bangor & Aroostook Railroad Co., because of

a decided slump in passenger and freight receipts, has suspended about 700 men for thirty days. The locomotive and car repair shops at Derby and the car repair shop at Houlton, Me., are closed, 400 men being affected.

The Belmont Stamping & Enameling Co., New Philadelphia, Ohio, which has been shut down since before the holidays, has resumed operations at about one-third of capacity.

The Western Malleables Co., Beaver Dam, Wis., manufacturer of railroad and automotive castings, shut down its plant June 1 with the expectation of resuming operations June 8 on a schedule of three days a week.

The Shenango and New Castle plants of the American Sheet & Tin Plate Co. resumed operations on June 2, after a shutdown of 10 days, 20 of the 40 hot mills at the former plant going on and 12 of the 20 at the latter plant. It is not expected that the plants will be in operation for more than a few weeks.

Says New York's Industries Have Passed Low Point

"Every New York industry under my observation is showing definite signs of improvement," states Arthur E. Allen, manager New York office, Westinghouse Electric & Mfg. Co. "These signs are faint in some cases, it is true, but nevertheless they are there. The low point has been passed."

"Practically all of the fundamental difficulties, such as the German indemnity payments, the general labor situation, and the railroad problem, are being cleared away, and in addition, there is a rapidly growing confidence in the present administration at Washington, which is a favorable factor of the greatest importance. It is, in fact, impossible to find a really threatening cloud on the horizon; and since everybody now wants to get to work, and since the need for goods of every description is universal, a speeding-up of industry is inevitable. No abrupt improvement can be looked for, but a gradual acceleration of all kinds of activity will occur until all hands should be busy by the first of the year."

All Frick Ovens Idle

UNIONTOWN, Pa., June 7.—Operations in the Connellsville bituminous coal region were marked by a further decrease during the week just closed. All Frick ovens in the region remain banked. Coal operations of The H. C. Frick Coke Company are maintained at about 40 per cent, a large percentage of this being from the by-product fields in the Southern Connellsville region.

W. J. Rainey, Inc., which has been operating at 80 per cent coke and 100 per cent coal, had a one-day lay-off this week at its coke plants. Coal operations were continued unchanged.

Only a very little coal for lake trade has gone out of the region this season, but such shipments have been almost completely suspended.

Smoke Prevention Association

The appointment of a public service committee to compile information relating to smoke abatement and to disseminate such information monthly to smoke prevention officials in every city in the United States and Canada was decided upon at the fifteenth annual convention of the Smoke Prevention Association, which met at Hotel Statler, St. Louis, May 31 to Jun 3.

Joseph M. Lonergan, chief sanitary officer of New York, president of the association, in opening the convention, said that during the war a laxity of enforcement of all regulatory laws became apparent, but that now a period of readjustment is at hand and that old safeguards built around health, life and property are again being sought out to exercise a controlling effect upon the unrest under which the country and the world at large is laboring.

The New Britain Iron Works, New Britain, Conn., has been sold at public auction to Bernard Miller of that city.

Crank Planer

A 24x24x24 in. crank planer, particularly adapted to forge shop work on such pieces as die blocks, rod straps, gibs, shoes, wedges, crossheads and slide valves, has been recently put on the market by the Woodward & Powell Planer Co., Worcester, Mass.

Massive and well ribbed construction of the bed, housing and crossrail is incorporated to insure ample rigidity, and the table has been given large bearing surfaces on the top of the bed and is gibbed its full length. The arch rests on and between the housings which are lipped on the bed. The stroke is adjustable by a removable crank operating a screw in the crank disk. Any length of stroke up to 24½ in. can be taken over any portion of the table, the position of the stroke be-

The Strokes Per Minute of the Planer Table Are 10, 17, 29 and 48, with a Ratio of Return to Cut of 1.4 to 1

ing adjusted by means of a shaft located at the front end of the table. This adjustment can be made while the table is in motion. The machine can also be furnished with a stroke of 28½ in.

The head is graduated in degrees and can be swivelled to either side for angular planing. The crossrail gibs are secured by nuts upon studs which are threaded into the rail and the rail screw and rod are squared at both front and rear ends to take a crank. The feeds for cross, vertical and angular travel are operated automatically by power or by hand and, taking place on the return stroke, do not require a longer stroke than is necessary for the cut.

The drive is by pulley connected to a four-speed gear box or by a 5 hp. motor mounted on top of the gear box with a pinion on the motor meshing with a gear on the gear box as shown in the accompanying illustration. The planer can also be operated with a four-step cone pulley in place of the gear box. The handle for operating the starting and stopping clutch of a gear box driven planer also operates a brake for stopping the table when the clutch is thrown out. All gears and revolving parts are safeguarded.

The table working surface is 40x21 in. The strokes per minute of the table are given as 10, 17, 29 and 48, with a ratio of return to cut of 1.4 to 1. The floor space occupied is 80x120 in., or 70x120 in. depending on the type of drive; and the weight is given as approximately 8,000 lb.

A contract has been signed by Topping Brothers, heavy and marine hardware jobbers, 122 Chambers Street, New York, with the White Construction Co. for the erection of a four-story and basement reinforced concrete warehouse and office at Varick and Vandam streets. This building will have 67,000 sq. ft. of floor space, according to the present building plans, and will be constructed so that three additional stories may be added. A feature will be a 30 x 70 ft. loading platform inside the building to expedite the handling of pick-up orders for city deliveries among the trade. Topping Brothers have been located on Chambers Street for 36 years.

Regional Meetings of Machine Tool Builders

Regional meetings of the National Machine Tool Builders' Association held at Boston and Worcester, Mass., and Hartford, Conn., June 1, 2 and 3, respectively, were well attended in each instance. At each meeting Ernest F. Du Brul, general manager, with the aid of charts, covered in a general manner the relation of price movements, demand for and production of various commodities and applied the same principle, as far as is possible, to the machine tool industry. He stated prices for machine tools necessarily must be governed entirely by individual conditions bearing on the individual line of machinery produced. The maintaining of high prices on a fictitious basis invites competition and Mr. Du Brul believes it equally unwise to cut prices without a thorough knowledge of the relation of such action to the cost of doing business. The real purpose of these talks was to show what the association is endeavoring to accomplish in the matter of securing statistics which will have some value to the members.

It was pointed out the task of compiling statistics costs money and the question of an increase in the annual dues of the association was discussed. Nothing definite has been decided which will increase the revenue of the association. General opinion among those attending these New England meetings appeared to be that the association is accomplishing something of real value. The regional meeting idea was endorsed.

Ring Coiling Machine

A new adjustable coiling machine for the manufacture of rings and coils to various diameters has been

Ring Coiling Machine on Which Angles 2 x 2 x ¼ in. Can Be Bent Cold to a 30-in. Diameter Circle

recently put on the market by the Wallace Supplies Mfg. Co., Orleans Street, Chicago. The machine is known as the No. 3.

The rolls are removable and can be arranged to suit the section of the material that is to be bent, viz.: pipe, angles, channels, tees, squares and other sections. The machine may also be used for manufacturing spirals out of reinforcement bars. Angles 2 x 2 x ¼ in. can be bent cold to a 30 in. diameter circle and lighter sections can be bent to smaller diameter.

The machine is operated by a lever engaging friction clutch pulleys for forward and reverse drive. The upper roller is adjustable by means of hand screw to secure any diameter of coil desired. Rollers can be furnished for any shape or section of material. The floor space occupied is 42 x 54 in., and the weight is 1200 pounds.

The Ordnance Salvage Board of the War Department has sold approximately 211,500 loaded brass fuses to the Rochester War Salvage Co., Inc., New York, at a price of 0.06789 cents each.

AUSTRIAN MARKET

Materials Plentiful but Shortage of Skilled Help —Protective Tariff Asked

(Special Correspondence.)

VIENNA, AUSTRIA, May 14.—The Austrian foreign trade returns for the year 1920, recently published, reveal the rather marked dependence of the Austrian iron industry on Czecho-Slovakia. Iron ores, chiefly Styrian and Carinthian, had to be shipped to Czecho-Slovakia in return for coke for domestic blast furnaces. In machinery, the trade balance is in Austria's favor.

A time extension has been arranged for the compensation agreement with Poland until March 31, 1922. Among other things the Austrian Government pledges itself to permit the export of 35 new locomotives and 550 railroad cars, as well as to provide for the repair of 500 Polish locomotives for a period of four years. Poland is furthermore to receive 50 truckloads of magnesite.

No Iron Shortage

The demand for tariff protection by the iron industry and the rapid improvement of the iron market are the two paramount topics in industrial circles. The improvement in the iron market has been astonishing. Not only has the shortage considerably abated but there is an actual surplus of iron on the market, partly due to increased production, but more to the influx of German iron. The increase in production is attributable to the interest agreement concluded some time ago between the Alpine Montan Gesellschaft and the German Rhein-Elbe-Union (Stinnes) by which the former was insured a sufficient supply of coke to resume operations on a larger scale. Coke supplies from Czecho-Slovakia have been so large lately that acceptance has been refused of any shipments exceeding contract tonnage since the housing shortage renders employment of additional labor impossible. A housing plan running into several hundred million kronen has been drawn up, but with building costs 160 times pre-war prices and a shortage of skilled and other labor, it seems doubtful whether all plants will operate to capacity before 1922.

Tariff Protection Demanded

The improvement of the iron and steel industry has given rise to a demand for tariff protection. The steel industry is determined to maintain the present high price level at any cost and is making strenuous efforts to persuade the Government to re-establish the customs barrier which was broken down by the revolution. No attempt is being made to conceal the fact that this action is primarily directed against German iron imports.

American Capital in the Machine Industry

One of the problems of the machine and engineering industry awaiting solution is the reconstruction and adaption of the former Government ordnance and war material plants, including the Vienna arsenal and other plants at Woellersdorf, Woerth, and Fischamend, all of which were converted in the spring of 1920 into the "State Industry Works." Most of these plants were erected during the course of the war and are equipped on modern lines. Operated at normal, they offer employment to more than 70,000 workers.

Some months ago, the arsenal at Vienna was converted into a communal undertaking, operating with a capital of 550,000,000 kr. and similar action will shortly be taken with the plant at Fischamend. This venture, however, will represent a combination of private and state capital. The proposed company is to be formed with an operating capital of 200,000,000 kr., of which the state will hold 80,000,000 and the remaining 120,000,000 kr. will be furnished by an American company, 20,000,000 kr. in cash and the balance in patents. It is intended to manufacture linotype machines and the American group is said to have guaranteed annual earnings of \$100,000, agreeing to sell a certain minimum output for a period of 15 years.

This plan by no means exhausts the productive possibilities of the plant, but nothing definite has been decided upon with a view to a 100 per cent operation.

Air Operated Wire Brush

A wire brush for use in connection with its standard No. 6 Little David drill has been recently put on the market by the Ingersoll-Rand Co., 11 Broadway, New York. The combination is intended for use in removing paint, rust, scale and dirt from tanks, steel cars, structural steel and all sheet metal surfaces. It is also

Air-Operated Wire Brush for Cleaning Paint and Scale from Metal Surfaces

said to be useful for cleaning iron, steel and aluminum castings.

The wire brush has a face diameter of 5 in., and is made up of wires of special heat treated steel. The drill has bearings to take up end thrust when pressing down on the work; and the motor is of high speed and light weight design. The weight of the drill and brush complete is 11½ lb.

No Shortage of Oil Feared

To offset recurrent predictions of approaching depletion of the oil fields of the United States, resolutions have been adopted by the Western Petroleum Refiners' Association, National Petroleum Association, American Independent Petroleum Association and Independent Oil Men's Association, affirming an abiding faith in a long future for the industry. After referring to the deterrent effect of pessimistic predictions, in preventing prospective consumers from adopting oil as a fuel, the resolutions call attention to new fields being developed continually, and express "confidence in the ability of the petroleum industry of the world to supply the needs of the world indefinitely. The oil-consuming world need have no more fear for the supply of oil in the future than for the supply of coal."

Interesting ancient history pertaining to iron making in Virginia appears in the April number of William and Mary College Quarterly, a historical magazine, Williamsburg, Va. The article is entitled "Anthony Langston on Towns and Corporations; and on the Manufacture of Iron." It was written about 1660, the original manuscript being in London, a copy of which rests in the Library of Congress and which has never been published before. The article is a prospectus of resources, equipment and men necessary for making "500 tunns of iron."

"A Method of Accounting for Scrap" is the subject of a bulletin for May of the National Association of Cost Accountants, 130 West Forty-second Street, New York. The early part of the bulletin discusses the theory of proper scrap accounting; then follows the application of the theoretical principles to four cases. On four loose bulletin service sheets are discussed the distribution of crane costs.

W. H. Weingar, representing the Pratt & Whitney Co., Hartford, Conn., addressed an open meeting of the American Society of Mechanical Inspectors at Hotel Sherman, Chicago, on June 7. His subject was "Measuring and Manufacturing in Millionths of an Inch." On June 6, he delivered the same address before the Western Engineering Societies, Rockford, Ill.

Graduating and Marking Machine

To provide for the performance of graduating operations where accuracy of the product and speed of operation are required the Noble & Westbrook Mfg. Co., Hartford, Conn., has recently developed the machine shown in the accompanying illustration.

Hand and power machines are furnished. On the power-driven machine, the placing of pieces of work in the machine and removing them when the operation has been performed, are the only duties required by the operator. With the hand machine, one turn of the handle completes the work. Provision is made for

The Range of Work of the Graduating and Marking Machine May Be Judged from the Finished Piece at the Base of the Machine

holding the work in the proper relation to the graduating die and the depth of the marking is governed by means of a foot lever, cam and weight, which are governed by a positive stop that is adjustable to provide for making any desired depth of lines. This insures making even and accurate impressions. The machine is equipped with steel spindles, adjustable bearings, and is fully automatic in operation, being stopped by means of a clutch on the spindle which drives the marking die.

An idea of the range of work for which the machine is adapted will be gathered by referring to pieces illustrated. Parts of various diameters can be graduated by changing the position of the intermediate gear located on the adjustable sector. Practically all types of modern machine tools are equipped with micrometer adjustments, and this machine is adapted for the graduation of the dials used on micrometer adjusting screws, also graduating and numbering cross slides and compound rests for lathes. The graduating and numbering are completed in one operation.

Eugene Schneider Awarded Fritz Medal

The John Fritz Medal Board of Award has awarded its gold medal and diploma to Charles Prosper Eugene Schneider, the distinguished French engineer, scientist, and man of affairs, head of the Creusot and other works in France. The following cable has been sent to his home in Paris: "John Fritz Medal Board of Award representing national societies of civil, mining and metallurgical, mechanical, and electrical engineers, has awarded you the John Fritz gold medal for achievement in metallurgy of iron and steel; for development of ordnance, especially the 75-mm. gun, and for notable patriotic contribution to the winning of the war."

Born Oct. 29, 1868, at Le Creusot, he has devoted his life to the development of the great industries which his forefathers founded. Upon the death of his father in 1898, he became the head of the company, when only thirty years of age. He was a member of the Chamber of Deputies of the French Parliament from 1898 to 1910. He has received many honors in his own

and other countries for noteworthy achievements. While in the United States in November, 1919, he was presented the gold medal of the Mining and Metallurgical Society of America.

The medal and diploma will be presented to Mr. Schneider in France by a party of distinguished American engineers, who will go to Europe in June. This party is led by Ambrose Swasey, chairman of the board of award, and will include several other officers and past officers of the national societies of engineers. They will bear greetings to the engineers of England and France from the engineers of America. At a large gathering of the English engineers in London in June, the American party will present the John Fritz gold medal and diploma to Sir Robert A. Hadfield, awarded sometime ago "for the invention of manganese steel," so useful in the war and in the industries of peace.

The John Fritz gold medal has previously been awarded to sixteen eminent American and foreign engineers and scientists.

Changed Design of Economy Lathe

The Rockford Lathe & Drill Co., Rockford, Ill., has developed a geared head and motor-drive for its Economy 14-in. swing quick change lathe.

The headstock is driven by a single pulley running at 400 r.p.m. and provides twelve spindle speeds in geometrical progression with the use of but thirteen gears. These are of large diameter, wide face and coarse pitch, cut from solid steel and run in oil. Spindle and shafts are of high carbon steel, ground to size. The spindle has a special thrust bearing of alternate collars of hardened steel and bronze. All bearings are

14-In. Swing Engine Lathe with Motor Mounted on Extension of Cabinet Leg

equipped with sight feed oilers. The quick change gear box is of new design and has thirty-two changes of threads and feeds obtained through sliding steel gears and hardened steel clutches, controlled by two convenient handles in connection with tumbler.

The motor may be of any standard make, preferably of 1½ or 2 hp. with constant speed having a maximum of 1200 r.p.m. The motor is mounted on a detachable plate which is fastened to a base cast integral with the cabinet leg, driving by means of a 3-in. belt kept at proper tension by an adjustable idler pulley. The intention of this design is to provide a quiet and flexible drive, and also to eliminate necessity of removing the motor in case lifting the cover of the headstock for inspection or adjustment becomes necessary. The motor may also be placed on the floor, wall or ceiling and belted direct to headstock pulley.

Metal Jobbing Problems Discussed

General Business Situation Given Consideration by Meeting at Cleveland of Metal Branch of National Hardware Association

BUSINESS conditions were discussed at considerable length at the tenth annual meeting of the metal branch of the National Hardware Association, held at the Hotel Cleveland, Cleveland, June 3 and 4. The meeting was attended by about 100 members, including manufacturers of sheet and tin plate and hardware jobbers who handle sheet metal. The general trend of the sentiment of speakers was optimistic. The opinion was expressed that the turning point had been reached and that a slow but steady improvement in business may be looked for. However, speakers avoided predictions as to when business would again become normal.

Representatives of sheet mills expressed confidence that orders would be better during the latter part of the year and that not much, if any, decline in prices could be looked for until there is a reduction in railroad rates and until there are further wage readjustments. Some opinion was expressed that consumers thought prices are still too high and that business will not pick up until there is a change in this attitude of buyers, or prices are further reduced.

The meeting was presided over by W. H. Donlevy, of Carter, Donlevy & Co., Philadelphia, chairman of the metal branch, who spoke briefly regarding industrial conditions. He said that the readjustment in prices was a step in the right direction but the failure of this readjustment to bring out business indicates that buyers are afraid that there will be further price reductions. He referred to several factors that should result in an improvement in business conditions particularly the good crops and the greater efficiency of labor.

A. H. Decatur, Boston, Mass., president National Hardware Association, discussed the business situation briefly. The cost of distribution for years has been greater, he said, than it should have been and this cost must come down, as selling values of products declined. He expressed an optimistic view regarding the future, asserting that the country has become almost bare of goods and that an enormous amount of money must be spent for repairs and replacements.

Campaign for Metal Roofing

The subject that brought out the greatest amount of discussion was that of a national publicity campaign in behalf of sheet metal roofing and exterior work. This was led by A. K. Raub, Raub Supply Co., Lancaster, Pa., who attributed the decline in the use of metal for roofs and exterior work in buildings to poor material and particularly poor workmanship. He declared that the people want better roofs and a campaign in this direction should be started by sending men out to educate the tinner.

H. N. Taylor, N. & G. Taylor Co., offered a resolution to be sent to the National Sheet Metal Contractors Association asking that special attention be given to the development and training of apprentices with the object of increasing the use of sheet metal products and elevating the standards of the entire industry. This resolution was adopted. Considerable discussion developed as to how a publicity campaign should be handled, as there are three interests involved, the sheet metal manufacturers, the jobbers and the sheet metal contractors. John Follansbee, Follansbee Brothers Co., said that the manufacturers had recently decided not to start a publicity campaign. After considerable discussion it was decided to appoint a committee of two distributors to confer with a committee of the Sheet Metal Contractors Association, which meets in Pittsburgh June 13, and take up the subject of publicity. F. O. Schoedinger and A. K. Raub were named as that committee.

E. T. Sproull, Trumbull Steel Co., Warren, Ohio, discussed the probable developments in the sheet metal market during the balance of 1921. In his opinion considerable brightness will develop in the steel industry before the end of the year. He said that the condition to-day is not due to the lack of demand but because of the lack of buying. Consumers are waiting for readjustments. He thought good business would be restored when people think the time is right to buy and prices are right. Considering freight rates, labor, etc., sheet mills, he thought, might make a little profit at present prices if running at 100 per cent capacity. Taking everything together he believed that the turn had been passed in the period of industrial depression and he predicted a gradual but substantial improvement over the remainder of the year. Representatives of some other sheet mills also expressed the belief that there would be improvement in business later in the year.

F. O. Schoedinger, Columbus, Ohio, presented a paper in which he compared the decline in prices of farm products with the decline in steel prices, showing that the former had declined to a much greater extent than the latter. He said that there must be a gradual deflation in prices and that when labor and freight rates are deflated, farm products will be on the same basis as pig iron.

Copper and Tin in Jobbing Trade

Considerable time was devoted to the discussion of various phases of the copper situation. An address on "The Copper Producers' Problems" was made by Thomas D'Arcy Brophy, Anaconda Mining Co., Anaconda, Mont. He said the one problem copper manufacturers had neglected was the problem of distribution and that was the greatest problem of the producers to-day. The producers had not co-operated as they should with the fabricators and the producers and fabricators had not co-operated with the distributors. The greatest demand comes from the electrical industry, and next to this comes the building industry. He stated that the manufacturers will use all their efforts to increase the use of copper, brass and bronze in the building industry, and referred to a sales promotion campaign that will be started with a view of popularizing copper in the building industry.

B. Goldsmith, president National Brass & Copper Co., Lisbon, Ohio, said that the spread between copper cakes and finished sheets is only 20 per cent greater than during the pre-war period, which he regarded as a remarkably low increase. W. D. Taylor, president of the George Worthington Co., Cleveland, declared that jobbers were not being allowed enough profit to permit them to handle copper, and similar sentiments were expressed by representatives of some other jobbing houses.

Isadore Davis, M. Lissberger & Son, Brooklyn, N. Y., protested against the proposed tariff on pig tin that is included in the pending Longworth tariff bill. Some of the tin plate manufacturers present also voiced their sentiments in opposition to a tariff on pig tin and a resolution was adopted by unanimous vote protesting against any tariff on this metal.

Exchanging Stocks Among Jobbers

A discussion of "The Position of the Distributor in the Present Market" was led by F. A. Heitmann, F. A. Heitmann Co., Houston, Texas. He said that many jobbers have large stocks and should be protected by the manufacturers. However, stocks must be liquidated. In his own town a plan of exchanging excess stocks had been placed in effect and had proved satisfactory. Under this plan jobbers exchanged surplus stocks

rather than placing new orders and in this way surplus stocks are being reduced more rapidly. He did not think that price reductions would stimulate business.

H. H. Riddle, George Worthington Co., Cleveland, said that his company had followed a similar policy in making exchanges with other hardware jobbers.

Reducing Overhead Expenses

The reduction of overhead expenses was discussed at some length, the discussion being opened by Clifford E. Pierce, Betz-Pierce Co., Cleveland, jobber in sheet iron and steel. He told how his company had cut down expenses by eliminating dead wood in labor, checking telephone calls, eliminating supplies for automobiles, etc., and reducing expense accounts. A survey of members prepared previous to the meeting indicated that overhead expenses were being reduced by reductions in salaries and wages, increased efficiency, elimination of bonuses and in the reduction of the number of employees.

Reports from members showed that the average overhead expenses during 1920 were 14.36 per cent on selling price and 16.79 per cent on cost price. During the first four months of 1921 the overhead expense was 20.05 per cent on selling price and 25.08 per cent on cost price. In this connection T. J. Fernley brought up the subject of high hotel rates and said that a great deal of the overhead expense could be cut down by securing a reduction of these rates. Steps that are being taken to attempt to induce hotel proprietors to reduce rates were referred to.

Zinc Roofing

E. H. Wolff, Illinois Zinc Co., Peru, Ill., read a paper on zinc roofing in which he gave a brief history of the zinc industry. He said that more zinc is being rolled in Europe than in this country and that it is being used very largely abroad for roofing purposes. In the past there has been a lack of education on the subject of zinc roofings, but now the zinc manufacturers have an organization, plan to do educational work and will dis-

tribute a zinc users' handbook. He said that producers are now doing more to meet the demands of consumers than formerly. Zinc is being used for more purposes, and manufacturers are making zinc of different qualities to meet requirements. Corrugated zinc sheets are now being made in all sizes. He exhibited a zinc shingle which his company is just bringing out and which will be sold through the jobbing trade.

It was decided to appoint a committee of distributors and manufacturers of sheet copper in order to effect a closer co-operation between the two interests and to see if a larger commission on sales cannot be secured for the jobbers.

H. H. Riddle led in a discussion on the subject of equipping salesmen with sales information. In his opinion something should be done and done quickly to educate salesmen. Various plans he suggested included talks by manufacturers, visits to manufacturing plants, the use of house organs and bulletins. He said that his company recently took 25 salesmen to a manufacturing plant, showed them the processes and the results have been very effective.

A statement was made during the discussion that best results can be obtained by calling in salesmen and keeping them posted on conditions and products and in this way keeping in closer touch with the salesmen. Clifford Pierce said a questionnaire was sent to salesmen which was found to be very effective. If the salesmen did not answer the questions properly they were corrected, and in some cases salesmen supplied information that was not known by the men higher up in the organization.

The following new members were elected to the metal branch: Peck-Stow-Wilcox Co., Cleveland; J. M. & L. A. Osborn Co., Cleveland; National Brass & Copper Co., Lisbon, Ohio; Superior Sheet Steel Co. and Eller Mfg. Co., Canton, Ohio; Faible & Co., Philadelphia. The arrangements for the Cleveland meeting were under the direction of a local committee, of which Clifford E. Pierce was chairman. The entertainment was limited to an informal dinner and theater party Friday evening.

Heat Treatment of Ordnance and Locomotive Forgings

Speaking at a meeting of the Washington Chapter of the American Society for Steel Treating, May 19, at the Harrington Hotel, Washington, P. E. McKinney, metallurgist Washington Navy Yard, discussing "Heat Treatment of Ordnance Forgings," called attention to the inadequacy of the ordinary inspection reports covering surface conditions of the metal and chemical composition in defining the quality of steel for high-grade forgings. Melting and forging records of an electric furnace heat of chrome-nickel steel having an abundance of non-metallic inclusions and of inferior physical properties, but within the requirements as to composition and surface, were shown. Examination of the melting chart revealed unsatisfactory slagging conditions which at once characterized the metal as questionable.

A few of the factors having serious bearing on the quality of steel and which are not apparent from a casual examination of raw material inspection reports were given as follows:

- Method used in refinements of steel
- Metallurgical control of conditions of slag.
- Methods of introducing ferroalloys, degasifying agents, etc.
- Condition of metal previous to tapping from furnace.
- Temperature of metal during refining and finishing.
- Size of nozzle used in teeming of ingots
- Method of pouring ingots.
- Size of ingot used for given purpose.
- Type of ingot used as regards chilling effect, etc.
- Rate of speed in pouring ingots
- Temperature of metal entering the ingot
- Shrinkage of the ingot on cooling.
- Behavior of the ingot during solidification

At the same meeting Lawford H. Fry, superintendent of production, Standard Steel Works, Burnham, Pa., in describing general practice in the heat treat-

ment of wrist pins, connecting rods, piston rods and axles, in a paper, "Theory and Practice in Quenching Large Locomotive Forgings," also emphasized the importance of "pre-natal" influence on the quality of finished product.

Data were given relating to the rate of heat dissipation in various quenching media, as follows:

	Blue Contracted per Sq. In. of Surface per Min.
In air	1.0
In heavy oil	2.7
In cutting compound	3.0
In light oil	3.6
In water	7.0

While these average figures hold for both large and small sections, the hardening is dependent upon the rate of temperature drop. Vigorous circulation of the quenching bath not only materially cuts down the time of cooling but may result in greatly improved elastic properties.

At the next meeting of the Washington Chapter, June 17, Enrique Touceda will be the principal speaker and will discuss malleable iron.

Judge Cochran, in the United States District Court at Covington, Ky., issued an order, in a suit filed by the Houston, Stanwood & Gamble Co., machine tool manufacturer, against Harry Meyers and other members of the machinists' union, which prohibits pickets from being stationed at the company's plant at Covington, Ky., interfering in any way with the present employees of the company or congregating of former employees, or anyone representing them, near the plant. At the preliminary hearing some time ago on the application for the injunction, Judge Cochran ordered that two pickets would be permitted to patrol the vicinity of the plant.

To Determine Status of Trade Associations

National Administration Will Not Tolerate Violation of Law, but Will Encourage Proper Activities—Statements by Secretary Hoover and Attorney-General Daugherty

WASHINGTON, June 7.—Clear understanding of the legal status of trade associations and trade institutes, such as are common to all important industries of the United States, is being sought by the Harding Administration as one of the underlying motives of the Department of Justice in announcing last week that those which engage in so-called "open price" practices will be prosecuted. That legitimate organizations will not be molested, but rather may be encouraged by the Government, it is desired to establish a plain distinction between those which are and those which are not operating within the law. In order to dissipate any alarm that business interests may have exhibited over the policy of the Administration, statements have been made both by Attorney General Daugherty and Secretary of Commerce Hoover that the great majority of such organizations are both complying with the law and rendering a national service. But there is at the same time a well-fixed opinion on the part of the Administration that a small minority of national associations which, encouraged during the war to gather statistics as to prices, stocks, consumption and related facts, and for other purposes, have continued the practice and are making use of the data for their own purposes to the detriment of the public interest. It is the latter which will be the subject of legal proceedings.

There is the old question, however, of drawing a difference between practices that constitute violations and those which do not. The so-called "twilight zone" enters into the situation and the Administration is endeavoring to have it defined clearly, precisely as has been attempted in the past, but so far without the desired degree of success.

Secretary Hoover issued a statement advocating that Congress empower the Federal Trade Commission with the constructive function, subject to review by the Attorney General, of removing the uncertainties from the mind of business "between the field of co-operation for promotion of production and trade in public interest and the field of practices against public interest." Attorney General Daugherty, pointing out that investigations of the associations have been conducted and that while it was not the policy to institute a general dragnet, those which are thought to be violating the law will have proceedings brought against them in courts. It was stated that practices and plans of associations which gather trade information are being inquired into for possible violation of federal statutes. The Attorney General said there are about 400 such associations. Of these 100 are reported to be under scrutiny. The Department of Commerce, Secretary Hoover said, wishes to co-operate and assist with all which are performing a public service as against "a small minority who have degenerated into ways that make for restraint of trade."

Cases Pending in Courts

Aid in ascertaining the differences between violation of and compliance with the anti-trust laws is hoped for from pending decisions by the United States Supreme Court in the hardwood lumber case and by a federal court in St. Louis in the yellow pine case.

While certain so-called "open price associations" are to be the object of action by the Department of Justice, which has not revealed the names of any in mind, other organizations also are under investigation.

"What the department intends to do," said Mr. Daugherty, "is to proceed vigorously against those classes of business which are violating the law. The department will begin its actions against violators by selecting a particular association which it holds is violating the law. The department will agree upon this procedure within a few days. I shall not name the

association that we have in mind. Our steps may include both the bringing of indictment and the filing of a bill under the civil statutes."

This statement of the Attorney General was made following the cabinet meeting on Tuesday of last week, when discussion was made of the Administration policy as to its attitude against combinations which are said to still maintain "open price" arrangements for the interchange of information such as was put into effect during the war. The fact that such practice was encouraged during the war, Mr. Daugherty said, does not mean that the Administration must acquiesce in its continuance. The view was expressed by the Attorney General that while such a practice may have served a good purpose during the period of the war, the effect now is to stifle competition and to result in unfair prices being charged to consumers. While there might not be definite agreements, he stated, "a wink of the eye and a nod of the head" were sufficient to accomplish the result desired.

Comprehensive Statistics

Mr. Daugherty has discussed the matter with Secretary Hoover, who is holding a series of conferences with representatives of leading industries in an effort to obtain their co-operation in the publication of comprehensive trade statistics by the Government, and that information and advice on the subject had been exchanged. Data given the Department of Commerce at these conferences are treated as confidential as to names of producers, etc., and will be used to aid both the Government and business, it is stated, as a guide to conditions in given industries and methods for promoting them for producers and consumers alike.

Mr. Daugherty said that it still is the policy of the Department of Justice, as was pursued under the Wilson Administration, to encourage the discontinuance of alleged violations by voluntary action, among associations, with a view to keeping at a minimum the amount of litigation brought by the department. He said that there are many instances reported to the department of such practices being discontinued. There is no intention, he stated, on the part of the Government to attack business associations, but there is considerable doubt, due to conflicting court decisions, as to how far business men could go in their organizations without violating the laws. He added that the object of the movement by the Department of Justice is to have the law definitely determined so that both the Government and the business men would know where they stand.

Secretary Hoover's Views

The attitude of Mr. Hoover accords with that of Mr. Daugherty, as denoted by the following formal statement issued by the former:

The relations of trade associations and trade institutes to the anti-trust laws have been discussed at great length in the Administration. Of the many thousands of such organizations there are a small minority which have degenerated into ways that make for restraint of trade.

All are agreed that the purposes and actions of the vast majority of all contribution of public welfare. Their activity in promotion of better business practices, advancement of technical processes, simplification of production, standardization of quality, extension of foreign trade, commercial arbitration, etc.—all make for more efficient industry and business. Many of them collect information as to the production stocks of raw and other material, percentage of industry in active operation, total orders in hand—all of which when available to the public, contribute both to stability and the increasing efficiency of industry and to the protection of both the

smaller manufacturer and the consumer. The Department of Commerce wishes to cooperate and assist with all of this sort of effort.

A smaller number of such associations have been engaged in the collection of data on the prices for the exclusive use of their members. Some of these associations have been argued with delimiting areas of commodity distribution among their members and other misuse of information.

Whether these latter practices constitute a violation of the national anti-trust laws must be determined by the courts, and this the Attorney General is vigorously proceeding to find out.

All this raises anew the question of the authority of the Federal Trade Commission. The original conception of the

commission was that it should, amongst other things, advise business men as to what constituted a violation of the restraint of trade laws, but these powers were struck out in the course of original legislation. It seems to me that the seven years' experience with the commission should now enable a reconsideration of its powers with a view to giving it a more constructive function, subject to review by the Attorney General, by which it could remove the uncertainties from the mind of business men as to the line between the field of cooperation for promotion of production and trade in public interest and the field of practices against public interest. There is nothing so destructive of business as uncertainty, and business has inherently enough to deal with, without this one.

CZECHO-SLOVAKIA DEPRESSED

Exports Decline—Labor Difficulties—Trade Agreement with Italy—New Export Association

(Special Correspondence)

PRAGUE, CZECHO-SLOVAKIA, May 18.—The depression in the Czechoslovakian market in the past few months continues and has even been gaining in volume of late. Mills in Bohemia and Moravia comment upon the lag in demand and the steadily declining export business to Poland and Austria. The situation is aggravated by strikes and lock-outs in the north Bohemia metal industry and the slump in production is naturally reacting upon the market. Among other works, the Iron Industry Co. at Prague has had to lay off men, declaring that it was impossible to operate collieries and smelting plants on a revenue-paying basis with the present high labor cost. Two shafts have been closed down and production at the furnaces considerably curtailed. A tendency toward wage reduction is clearly evident in the iron and steel industry, but attempts in this direction are meeting with stubborn resistance from labor, despite the fact that the level of living costs has been lowered. Practically all the larger plants are operating at about 50 per cent of capacity; several works producing for stock while others are planning to introduce part-time. The industry generally is anticipating a revival of export business following the conclusion of an agreement with Austria, under negotiation, but even with this, stiff German competition in the Eastern market must be considered.

Steel Production Still Low

The figures on steel production during 1920 are now available. An aggregate of 972,976 tons of steel was produced, of which 163,663 tons (16.82 per cent) was basic Bessemer, 792,794 tons (81.48 per cent) was open hearth and 16,519 tons (1.7 per cent) was electric furnace. Compared with 1919, the total output shows an increase of 186,954 tons or 23.8 per cent, which is principally because of improved fuel supply as well as resumption of operations at Slovakian plants. A study of the figures for former years reveals, however, that the 1920 figures are still behind pre-war and war production, the output of plants in what is now Czechoslovakia during 1913 having amounted to 1,237,021 tons, while 1,610,079 tons were produced in 1917 and 1,019,032 tons in 1918.

Trade Agreement with Italy

A trade treaty has been signed between Italy and Czechoslovakia valid for one year beginning April 15. Under its terms Czechoslovakia, among other commodities, is permitting the import of the following maximum quantities: 1000 automobiles, 300 motorcycles, 1000 pedal bicycles, 15 tons of bicycle accessories, 100 tons of cables and electric wires, 250 tons of electrical material which includes ventilators, motors under 1 h.p., direct and alternating current motors up to 2000 h.p., pumps, fans, etc., and 25 tons of dough-mixing and kneading machinery. Italy in return permits the import of 1000 automobiles and 100 motor plows as well as the export of 10,000 tons of iron ores and 6000 tons of pyrites.

Slackness reported in the coal industry is beginning to react upon certain branches of the machinery

manufacture, as is evidenced by the reserved attitude of collieries, coke oven plants, etc., which have always been regarded the best customers. Conditions in the agricultural machinery line also leave much to be desired. Whether the recent reduction of the export levy from $\frac{1}{2}$ per cent to $\frac{1}{4}$ per cent of the invoice value will act as a stimulus to the export market, remains to be seen. Except for some activity in vehicle and rolling stock manufacture, there is very little improvement.

Increased attention is being devoted to stimulating export business and eight of the leading firms, including the Skoda works, Rustan and Laurin & Clement, recently organized an export association for the promotion of Czechoslovakian machinery sales abroad. The total capital represented in the association amounts to 274,000,000 kr. while the number of workmen employed by affiliated firms is about 44,000. Another association being organized will handle the export of railroad ties. A certain percentage of the production is to be placed at the disposal of the domestic railroads at lower prices while surplus output is to be exported. Part of the rolling stock industry is occupied with orders for parlor cars for the Egyptian railroad administration, four coaches having arrived at Antwerp en route to Egypt some time ago.

British Steel Exports Still Small in April—Imports Continue Heavy

British steel exports in April this year, excluding iron ore and including scrap, were 161,508 gross tons as compared with 149,847 tons in March, with 167,158 tons in February and with 233,144 tons in January. The April exports last year were 274,337 tons. The average per month in 1920 was 274,881 tons per month while in 1913 it was 420,757 tons per month. The 1919 rate was 188,519 tons per month. The April outgo is therefore less than even the 1919 monthly average and close to the smallest in the war years. Imports in April were 111,536 tons, which contrast with 196,945 tons in January, with 181,565 tons in February, with 179,610 tons in March, and with 128,685 tons per month in 1920. The 1913 imports were 195,264 tons per month.

Expressed as a table the exports and imports this year and in previous years were as follows in gross tons:

	Exports	Imports
January, 1921	233,144	196,945
February, 1921	167,158	181,565
March, 1921	149,847	179,610
Aver. per mo., first quar., 1921	183,373	186,040
April, 1921	161,508	111,536
Average per month, 1919	188,519	50,801
Average per month, 1920	274,881	128,685
Average per month, 1913	420,757	195,264

The trend of some of the principal exports is shown by the following data in gross tons:

	Average per Month	April, 1920	April, 1921
	1913	1920	
Pig iron	78,771	33,505	52,095
Steel rails	41,676	11,213	7,408
Steel plates	11,162	16,571	12,393
Galvanized sheets	63,506	34,244	36,206
Steel bars	20,921	30,322	27,825
Tin plates	41,208	29,418	32,951
Black plates	5,679	3,026	2,261
			878

The April exports of steel rails exceeded the 1920 monthly rate, all others showing a pronounced decline.

Pig iron imports in April were 33,662 tons as compared with 11,216 tons in April, 1920. The monthly

average imports in 1920 and 1913 were 12,705 tons and 18,069 tons respectively.

Iron ore imports in April were only 123,588 tons as compared with 541,742 tons per month in 1920. In April, 1920, they were 748,418 tons. The total for the first four months was 1,234,261 tons as compared with

2,073,737 tons in the first four months in the year 1920.

Manganese ore imports were only 7694 tons in April against 37,717 tons per month in 1920 and 50,098 tons per month in 1913. The total to May 1 this year was 112,186 tons against 109,482 tons for the same four months last year.

TARIFF LEGISLATION

New Causes for Delay Develop—Duty May Be Placed on Manganese Ore

WASHINGTON, June 7.—Permanent tariff legislation is in a state of confusion. Members of the House Committee on Ways and Means still have differences of opinion as to certain schedules, including those relating to silk, cotton, wool and chemicals. Several items in the metal schedule also remain to be acted upon, including ferromanganese, though it is said this is due to a request of members of the sub-committee having charge of this schedule rather than to any sharp divergence of views. It is claimed that some further consideration is being given these particular items in the metal schedule, yet it also is indicated that the full membership of the committee does have conflicting opinions on them. The recommendation of the Payne-Aldrich rate of \$2.50 a ton is said to have been made by the sub-committee on ferromanganese when it presented its schedule, but it remains to be seen whether this may not be increased. There is an absence of clear evidence, however, that an advance will be suggested. Such a move, it is believed, would mean the fixing of a duty on manganese ore, which has been both opposed and defended, with the result that the recommendation of the sub-committee is reported to have been that manganese ore be continued on the free list.

The differences within the committee itself are apparently not so important as are those of the full Republican membership of the House over the Longworth joint resolution giving the Ways and Means Committee discretionary power to make any or all duties in the forthcoming permanent tariff bill effective from the day the latter is reported to the House. The conference of the House Republicans last Wednesday over the resolution developed vigorous opposition to the resolution. Part of the protest was against the entire purpose of the resolution, while some of the opposition was to the form of the resolution. This takes the character of an argument that the resolution gives too much power to the Committee on Ways and Means by permitting it within itself to determine the rates to be put into effect without first letting Congress pass upon them. It is likely that, in pressing the Longworth resolution further, a compromise will have to be effected, if it is to succeed in passage, which, at present, seems to be doubtful. For not only is there opposition in the House Republican membership, and practically the entire Democratic membership, but the Senate appears to be hostile to such legislation, both as to Republicans and Democrats, though a real test might develop more support of the resolution in the Senate than has been indicated. Not a great deal of support has been given to the claims of opponents of the resolution that it is unconstitutional.

Perplexing Features

It can not be denied that the tariff is proving to be a perplexing problem with some new features of difficulty. The so-called differences cannot be accepted, however, as proof that Republicans as a whole are lukewarm regarding a protective tariff. The great majority favor it and with old-time vigor, though taking into consideration present-day economic conditions, such as the high cost of living, world-wide trade depression and disturbed international exchange, calling for careful procedure. Some are especially urgent in insisting upon passage of the Longworth resolution and say that unless it or some other sort of ad interim legislation is enacted the country will be made the dumping ground for imports despite anti-dumping leg-

islation. They also still are in sympathy with the plan to enact exchange legislation based on American valuation to replace the provision attached to the emergency tariff act.

The disagreements over the tariff legislation leaves as much doubt as ever as to when the permanent bill will be ready for reporting to the House. Dates are set only to pass by without action, and, while suggestions now are made that the measure will be ready by June 15, expressions are heard that the actual date will be nearer July 1. So uncertain are some members of Congress that they have reached the point where they favor the idea of Congress taking a recess for a month or so before anything further is done regarding either tariff or taxation or other important legislation. The program before Congress still is so great that it is apparent it will have a long, difficult grind ahead of it before the work is done, and some members think this session will practically merge into the new one before the program can be completed.

Lake Iron Ore Shipments in May Small

Shipments of iron ore from the Lake Superior region in May were 2,594,027 gross tons or 62.81 per cent less than in May, 1920, when the total was 6,976,085 tons. This is a decrease of 4,382,058 tons for May this year. In May, 1920, there was increase of 5.45 per cent over May, 1919. The comparative shipments by ports for May, 1920, and May, 1921, and for the season were as follows in gross tons:

	May, 1920	May, 1921	To June 1— 1920	To June 1— 1921
Escanaba	795,673	72,048	795,673	72,048
Marquette	375,036	13,985	375,036	13,985
Ashland	1,013,049	208,390	1,013,049	217,539
Superior	1,983,660	730,708	2,189,246	842,556
Duluth	1,662,971	1,199,457	1,688,239	1,226,888
Two Harbors	1,115,696	369,439	1,145,696	397,222
Total	6,976,085	2,594,027	7,206,939	2,770,238
Decrease		4,382,058		4,436,701

The decrease to June 1 this year is 61.56 per cent as compared with the same date in 1920, or 4,436,701 tons. A year ago there was a decrease as compared with 1919 of 820,641 tons. The Duluth and Superior percentage of the total to June 1, this year, was 74.70 per cent against 53.80 per cent last year. The Escanaba proportion of the total was only 2.61 per cent as compared with 11.04 per cent last year. Duluth's percentage of the total this year was 44.29 as compared with 23.42 per cent to June 1, last year.

To provide against collisions between locomotives and either vehicles or pedestrians, the Illinois Steel Co. has installed a safety reflector device at a blind corner in its South Chicago works, according to the *National Safety News* for June. Drivers and pedestrians going north and engineers proceeding east on the narrow gage tracks were previously unable to see each other until face to face, accidents being narrowly averted. Since the mirror was installed, approaching parties can see each other at 60 to 70 ft. apart. In addition, the square corner of the open-hearth building has been rounded off.

The Bureau of Supplies and Accounts, Navy Department, is asking for bids on 90 gross tons of ferromanganese, 75,000 pounds of nickel in shot form, 446 gross tons of foundry pig iron, 90 gross tons of lump Bessemer ore and 23 tons of 50 per cent ferrosilicon, all for delivery at the Navy Yard, Washington, as may be ordered during the period ending June 30, 1922. The tonnages asked for are estimates only and the Government will not be obligated to order any specific quantity of the material contracted for.

Power and Portable Saws

Two new machines have been added to the line of saws manufactured by the W. Robertson Machine & Foundry Co., Buffalo, N. Y. They are the No. 2, 1921 model Economy power saw with 6' x 6 in. capacity and the Economy portable machine, illustrated in the accompanying illustrations.

The No. 2 saw is a draw cut machine and is equipped with an oil lift pump for relieving the teeth of the blade of drag on the idle or return stroke. This feature consists of a two cylinder pump submerged in oil, one plunger of the pump being timed with the crank shaft and the other plunger connected to the frame. At the end of the cutting stroke, the plunger connected to the crank shaft is on the down stroke, which forces the

Power Saw Equipped with Oil Lift. The insert shows a general utility portable saw, hand or power operated

oil under the plunger connected with the frame, thus raising the frame from the work. At the beginning of the cutting stroke the pump timed with the crank shaft has just passed a port allowing the oil to escape, thus permitting the frame to lower while on the cutting stroke. This feature is employed in a larger machine described in THE IRON AGE of Jan. 25, 1917.

With the oil lift blades cannot be broken by the frame falling on the work and it is claimed that upward of 200 per cent more service is obtained from the blade. A swivel vise is provided for cutting angles up to 45 deg. The machine is driven by a friction clutch and stops automatically when the cut is completed.

The Economy portable saw is hand or power driven and is designed as a general utility machine in the shop or elsewhere when the two legs are applied. Used in steel yards or warehouses the current is taken from lamp sockets and where current is not available a lever is provided for hand operation. The machine has a capacity of 8 in. using 17 in. blades. The motor is mounted on a bracket supported from the bed and is coupled to a shaft on which there is a steel worm running in oil. This worm drives a gear on which there is a crank wheel which in turn is connected by a rod to the frame. The feed is by gravity.

The Youngstown Sheet & Tube Co. advises that W. E. Manning, vice-president and general sales manager of that company, was incorrectly quoted in a report of the annual meeting of the National Pipe and Supplies Association in the May 26 issue of THE IRON AGE. Remarks attributed to Mr. Manning were to the effect that his company's orders for welded pipe had increased since early in the year. Mr. Manning states that he did not discuss the plant operations of his company in the course of his remarks at that meeting.

Steel Workers Decrease

WASHINGTON, June 7.—Employment in the iron and steel industry in May showed a decrease of 8781 workers below the number in April, according to the United States Employment Service. Based on actual payroll returns from 428 of the larger firms in 14 lines of industry in 65 principal industrial centers, each nominally employing 500 or more, a total of 1,600,000, the net decrease was 7211 workers, or 0.5 per cent. The total decreases in seven industries was 27,383, of which 21.9 per cent represented the iron and steel industry, and the increase in employment in seven industries was 20,172.

Among the latter industries were railroad repair shops, leather, automobiles and textiles. The net decrease in employment since January 31, has been 54,596, or 3.3 per cent.

Some of the iron and steel centers showing decreases in employment in May, and the number affected, follow: Buffalo, 1920; Cincinnati, 1017; Johnstown, Pa., 714; Birmingham, Ala., 1222; Chicago, 4892. A slight increase in employment was shown in other steel centers, as in Youngstown, where the increase was reported to be 265; Cleveland, 586, and Pittsburgh, 511 men.

New Line of Drilling Machines

A line of drilling machines has been developed by the Cincinnati Hy-Speed Machine Co., Cincinnati, and are being marketed under the name of Hy-Speed. The accompanying illustration shows the general construction.

Among the features of the line are the single pulley direct overhead drive and the dry-plate clutch operating in connection with an external clamping adjustable air-cooled brake. A single handle directly in front of the operator is provided for convenient starting and stopping. The table elevating mechanism is arranged to allow taps, etc., to pass through the center of the table, a feature which with the use of a quick release chuck permits tapping without reversal at high spindle speeds. Spindle speeds are controlled by a handle outside of the column. Automatic power feed and automatic tapping attachment can be arranged on any spindle.

Unit construction is embodied in the machine, the entire clutch, brake and initial driving gear being a separate unit that is set into the top bracket. For accessibility the counter weight for the spindle is hung on the outside of the machine. A narrow face idler pulley is carried directly on the belt shifters and moving intermittently with the shifters helps lead the cone belt from one step to another. Aluminum pulleys are used throughout.

The pump and tank is a separate unit, attached to the base of the machine. S. K. F. ball bearings are used.

The line includes floor and bench type machines; single speed purpose, belted motor drive, automatic power feed and automatic tapper.

The Table Elevating Mechanism Is Arranged to Allow Taps to Pass Through the Center of the Table

United States Steel Corporation's Answer

Makes Specific Denial of Many Allegations of Complaint in Pittsburgh Plus Case and Plants Itself Upon Decision in Dissolution Case

THE United States Steel Corporation last Saturday filed at Washington its answer in the so-called Pittsburgh plus case of the Federal Trade Commission against the United States Steel Corporation, American Bridge Co., American Sheet & Tin Plate Co., Carnegie Steel Co., National Tube Co., American Steel & Wire Co., Illinois Steel Co., Minnesota Steel Co., Clairton Steel Co., Union Steel Co., Lorain Steel Co. and Tennessee Coal, Iron & Railroad Co. The answer of the corporation consists of a denial of many of the allegations of the complaint and rests to a large extent upon the decision of the Supreme Court of the United States in the dissolution case, findings of that court being carefully stated in the thirteenth paragraph of the answer.

Paragraph 5 of the complaint, which is denied as to every allegation, inference and argument, charged that for more than seven years the corporation had issued quotations of prices covering the products of its respondent subsidiaries, which schedules were accepted by the subsidiaries and their competitors and that this practice of fixing uniform prices succeeded the custom which formerly prevailed whereby manufacturers openly met and agreed upon prices. •

Paragraph 8 of the complaint, likewise denied, consisted of an attack upon the Birmingham price as unfair and unlawful.

Paragraph 10 set forth in detail the alleged results of the Pittsburgh basing plan, charging that it gave Pittsburgh steel manufacturers unfair advantages in extending their trade to the detriment of others, and enabled steel manufacturers outside of Pittsburgh to increase their profits unduly.

Probable Course of Procedure

The Washington representative of THE IRON AGE sends the following statement as to the present status of the case:

"Study is being made by the Federal Trade Commission of the reply of the United States Steel Corporation to the commission's complaint in the so-called Pittsburgh plus case with a view to determining the procedure that will be followed. Any points of agreement by the commission and Steel Corporation will be eliminated as topics for discussion at the approaching hearing, while the points of dispute, together with new angles that the commission may consider the Steel Corporation has developed will be made the objects of attack and defense. In the absence of completion of its study the commission is unable to state the precise character of its program, such as the steel centers where hearings will be held. It is believed, however, that they will largely revolve around Pittsburgh, Chicago, Duluth, Minn., and Birmingham, Ala.

"The formal conduct of the case, however, is outlined automatically by the act creating the commission. It will, upon scrutiny of the reply, negotiate with the Steel Corporation for the purpose of setting a date when the hearings shall be begun. An examiner and an attorney will be selected by commission to have charge of the proceedings for it, and it is believed that Attorney Stienhaur, who drew the complaint, will conduct the hearings for the commission. The name of the examiner in charge is said not to have been decided.

"At the conclusion of the hearings, which promise to be of a protracted character, each side will file

briefs, summarizing the evidence adduced, and making contentions each respective side considers to be of the most importance. This will be followed by formal arguments before the entire commission, which will take place in Washington. The decision then will come next and should it be in the nature of a "cease and desist" order, appeal undoubtedly will be made to the United States Supreme Court. Should the commission find that the use of the so-called Pittsburgh plus plan in selling steel does not constitute an unfair method of competition, the case would come to an end and the practice left undisturbed.

"So far none of the independent steel companies has asked to intervene in the case. It will remain with the discretion of the commission, if they make such request, to decide whether it shall be granted or denied."

Text of the Answer

The answer of the Steel Corporation and subsidiaries follows:

UNITED STATES OF AMERICA. BEFORE THE FEDERAL TRADE COMMISSION.

Federal Trade Commission vs. United States Steel Corporation, American Bridge Co., American Sheet & Tin Plate Co., Carnegie Steel Co., National Tube Co., American Steel & Wire Co., Illinois Steel Co., Minnesota Steel Co., Clairton Steel Co., Union Steel Co., The Lorain Steel Co., and the Tennessee Coal, Iron & Railroad Co

The above named respondents come now and answer the complaint herein as follows:

I. Respondents admit that United States Steel Corporation is a corporation organized and existing under and by virtue of the laws of the State of New Jersey, and that it has offices in the City of New York, State of New York. They refer to the certificate of incorporation of said United States Steel Corporation annexed hereto and marked "Exhibit A" for a statement of the purposes for which said corporation was organized. They admit that said United States Steel Corporation acts as a holding corporation of substantially all of the capital stock of the corporations named in paragraph one of the complaint as subsidiaries thereto, and they are hereinafter referred to as such. They admit that said subsidiaries are engaged in the manufacture and sale of iron and steel and the products thereof as in said complaint stated, except that they say that the plant of the Clairton Steel Co. is leased to and operated by the Carnegie Steel Co., and the plants of the Union Steel Co. are leased to and operated in part by the Carnegie Steel Co., in part by American Steel & Wire Co. and in part by the American Sheet & Tin Plate Co.

II. Respondents aver that United States Steel Corporation sustains no relation to any of said subsidiaries except as a stockholder as aforesaid, although it does from time to time make recommendations to said subsidiaries with respect to the conduct of their several business and exercises such control over them as is incident to such stock ownership. Except as herein admitted, respondents deny the allegations contained in paragraph two of the complaint.

III. Respondents admit the allegations contained in paragraph three of the complaint with respect to said subsidiaries except the Clairton Steel Co. and the Union Steel Co., but deny the same with respect to the United States Steel Corporation and said two subsidiaries.

Ore and Limestone Deposits

IV. Respondents deny that United States Steel Corporation through its said subsidiaries or otherwise owns

or controls over 75 per cent of the total iron ore deposits in the Lake Superior district; deny that it or its subsidiaries own or control the greater part of the iron ore deposit in the State of Alabama; deny that it and its subsidiaries own or control the ultimate iron ore supply of the United States; deny that it and its subsidiaries own or control the major number of the railroad and lake transportation systems which carry the iron ore from the mines to the manufacturing plants of said subsidiaries and their competitors; and deny that, except to a limited extent, it or its subsidiaries own or control the coal mines which furnish the necessary coal employed in the manufacturing processes of said subsidiaries. They admit that said subsidiaries control sufficient limestone quarries to furnish the limestone employed in their manufacturing processes, as do substantially all other steel manufacturers, but say that limestone is found in such vast quantities in all parts of the country as to be readily available to anyone. Respondents say that United States Steel Corporation and its subsidiaries do not own or control over 30 per cent of the total iron ore deposits in either the Lake Superior district or in the State of Alabama; and that altogether they control only two ore carrying railroads in the Lake Superior district out of nine such railroads operating therein, and only one out of seven such railroads operating between the lower lake ports and the manufacturing plants of said subsidiaries and their competitors, and that said railroad, so controlled by respondents are obligated by law and do in fact serve all interests alike and without discrimination and at rates fixed by the Interstate Commerce Commission.

Transportation and Other Activities

Respondents further say that the lake transportation system controlled by them or some of them and referred to in said complaint is employed solely in transporting ore, coal and limestone for the subsidiaries of the United States Steel Corporation and does not transport said materials or any of them for any other interests, the ore, coal and limestone of other manufacturers being transported to and from the Lake Superior district by various other transportation systems. Respondents also say that they do not, nor do any of them, own or control coal mines with a sufficient output to furnish all the coal necessary in the manufacturing processes of said subsidiaries; on the contrary, said subsidiaries are compelled in normal times to purchase a substantial quantity of their coal requirements from outside sources. Respondents admit that United States Steel Corporation has capital stock outstanding of the par value of \$868,583,600, and of a book value exceeding one and one-half billion dollars. They also admit that the gross assets of said United States Steel Corporation and of all of its subsidiary companies aggregate over two billion dollars. They say that said United States Steel Corporation does not itself manufacture or sell any steel products, but admit that the total annual business of its subsidiaries, including inter-company business, has at times amounted to approximately one and one half billion dollars. Respondents admit that said subsidiaries manufacture approximately 47 per cent of crude steel in the form of ingots, but say that said subsidiaries sell practically none of the crude steel manufactured by them in that form. They admit that at times said subsidiaries manufacture approximately 45 per cent of the semi finished rolled steel in the form of billets, blooms, slabs, sheet and tin plate bars, and furnish rolled steel in the form of rails, plates, sheets, structural shapes, bars, wire rods, skelp, hoops, bands and cotton ties, manufactured in this country, some of which is sold by them in interstate commerce. They say, however, that the percentage of these products manufactured, as well as the percentage sold, by said subsidiaries varies from time to time and is dependent upon business conditions. They deny that said subsidiaries manufacture or sell approximately 60 per cent of other steel products, such as wire and the products made therefrom, pipes and tubular goods and tin plate, and allege that the total capacity of the subsidiaries to produce these materials is much less than 60 per cent, and that the percentage of such products

manufactured and sold by them varies from time to time, depending upon business conditions.

Some Buy Steel

Respondents admit that some of the competitors of said subsidiaries do not manufacture steel but purchase semi-finished steel from the manufacturers thereof, and make and fabricate therefrom various kinds of steel products, some of which are made and fabricated by said subsidiaries. They say, however, that numerous of said competitors do in fact manufacture their own steel and finish the same into various products, and that there is an open and unrestricted market for the supply of those who do not so manufacture their requirements of steel. Respondents deny that United States Steel Corporation owns, controls or utilizes, directly or indirectly, 145 plants for the manufacture of steel products. They say that the total number of plants of said subsidiaries engaged in the manufacture of both steel and steel products and the fabrication of the latter does not exceed 125, and that no plants or such subsidiaries are located in the States of Maryland, Kentucky, Kansas, and Washington.

V. Respondents deny each and every allegation, inference and argument contained in paragraph five of the complaint.

Practice as To Quoting

VI Respondents admit that, with certain exceptions mentioned in the complaint, said subsidiaries usually quote their products on what is commonly called the Pittsburgh basis, which represents their prices for such products in Pittsburgh plus the freight to the point of sale and delivery. This is the practice among steel manufacturers generally. Respondents deny that said price is arbitrarily fixed or arrived at, and say that it varies from time to time, and among the different manufacturers, and represents the judgment of each manufacturer as to the market conditions affecting or likely to affect his particular products. They further say that said quoted prices are seldom adhered to strictly, either by said subsidiaries or their competitors; that steel is sold by all of them, subsidiaries and competitors, in the different consuming localities, at the market prices prevailing therein as determined by the law of supply and demand and the competition among the manufacturers, which competition now is and for a long time last past has been vigorous and unrestrained and extends to prices, quality and service, and to every article of production in every locality in which the same is sold. They also say that said market prices are frequently materially lower than the prevailing Pittsburgh price plus the freight rate from Pittsburgh to point of destination, particularly when the supply from the territory outside of Pittsburgh equals or exceeds the demand in such territory.

Convenience of Customers

The practice of quoting a base price is largely for the convenience of customers and is not confined to the steel industry nor to this country but exists throughout the world, and is followed in many, if not most, of the more important lines of production and sale. In the steel industry it has obtained from the beginning and became a settled custom long before the United States Steel Corporation was formed. Pittsburgh was made the basing point in the early days because at that time nearly all steel was manufactured in the Pittsburgh district. It has remained the basing point simply because, notwithstanding the construction of steel manufacturing plants in other localities, the country outside of Pittsburgh is still dependent upon the Pittsburgh market for the major part of its requirements of steel excepting rails.

Respondents deny that said subsidiaries, other than the Tennessee Coal, Iron & Railroad Co., sell their products of steel in Birmingham, Alabama, or any other basis than elsewhere, or that they sell in Birmingham at the Pittsburgh price with the addition thereto of \$5 per ton. They admit, however, that the Tennessee company does sell certain of its products in Birmingham on the basis stated in said complaint, and say that the price so arrived at represents a temporary concession

made by the Tennessee company to the Birmingham manufacturers in order to enable the latter to develop certain industries which would be of great benefit to the South, and would furnish an additional market for the products of said company.

Costs at Various Points

VII. Respondents deny that steel is manufactured in either Chicago, Ill., or Birmingham, Ala., more cheaply than in Pittsburgh, but admit that the price charged for steel by the said subsidiaries in each Chicago and Birmingham exceeds the Pittsburgh price by more than the difference in the cost of production in the respective localities. They deny, however, that the price charged in Chicago, Birmingham and the other localities mentioned in the complaint is either unfair or unlawful, and aver that with the exception mentioned at the end of paragraph VI it is the market price prevailing in each locality regulated by the law of supply and demand and the free play of competition in the locality affected, and varies from time to time in accordance with the market conditions obtaining therein.

Respondents deny that purchasers of rolled steel outside of Pittsburgh are unable to secure such steel from any steel manufacturer in the United States at any price other than the Pittsburgh plus price, and repeat the averments contained in paragraph VI above in that regard.

VIII. Respondents deny each and every allegation, inference and argument contained in paragraph eight of the complaint.

IX. Respondents admit that the different prices charged by said subsidiaries for their various products as between different localities and communities are not made on account of differences in the grade or quality of such products and that such differences in price are not based on differences in the cost of selling such products or on differences in the cost of transportation. They aver, however, that such different prices are made in good faith on account of the quantities furnished or to meet competition in the different localities and communities, and represent the market prices prevailing therein from time to time. They deny that such differences constitute discrimination within the meaning of Section 2 of the Clayton act or any other law of the United States.

X. Respondents deny that they or any of them utilize Pittsburgh plus price to accomplish or that they do accomplish any of the purposes stated in paragraph 10 of the complaint, and they deny each and every allegation of fact, inference and argument contained in the various sub-divisions of said paragraph.

No Unfair Advantage

XI. Respondents deny that the practice of said subsidiaries under the Pittsburgh base plan as described in paragraph VI. above now has, or ever has had, the effects stated in paragraph 11 of the complaint, or any of them. They deny that such practice gives to the Pittsburgh fabricators, including said subsidiaries, an unfair or undue advantage over fabricators in other parts of the United States. They say that the fabricators located outside of the Pittsburgh district are and always have been free to locate wherever it appeared to them that their business could be conducted most profitably; that everyone of them, whether situated at Chicago, Duluth, Birmingham, Fort Dodge or elsewhere, chose his location and erected his plant after the Pittsburgh basing practice had become an established custom in the steel industry, and that while, by reason of difference in freight rates, rolled steel delivered at their plants generally costs them more than it costs the Pittsburgh fabricators, they have other countervailing advantages on account of which they have prospered more and increased in number much faster than the Pittsburgh fabricators.

Respondents deny that the Pittsburgh basing practice tends to lessen competition with or create a monopoly for the Pittsburgh fabricators including said subsidiaries. They say that on the contrary its tendency is to stabilize the fabricating industry, increase competition and distribution and prevent monopoly therein and in the steel trade generally, and that such

has been its effect notwithstanding the increase in railroad freight rates referred to in said complaint.

Respondents deny that the possession of fabricating plants as well as steel plants in Pittsburgh or elsewhere gives to said subsidiaries an unfair, undue or illegal advantage over their competitors anywhere, either by reason of said Pittsburgh basing practice or otherwise, or that it tends to lessen competition with or create a monopoly for said subsidiaries. They also deny that said Pittsburgh basing practice provides a method whereby the steel manufacturers of the United States maintain uniform prices among themselves. Respondents say that as matter of fact uniform prices are not and for a long time have not been maintained among the steel manufacturers; that on the contrary steel prices do now and for a long time past have varied widely between all manufacturers in all parts of the United States and in substantially every line of production. Such prices are fixed by the several manufacturers independently and there is not now and for many years has not been any agreement or understanding, expressed or implied, between such manufacturers with respect thereto.

Does Not Violate Clayton Act

XII. Respondents deny that in following the Pittsburgh basing practice or otherwise said subsidiaries have been or are using an unfair method of competition in commerce within the intent and meaning of Section 5 of the Federal Trade Commission act or have been or are discriminating in price between the different purchasers of their products in violation of Section 2 of the Clayton act.

The Dissolution Suit

XIII. Respondents further aver that on October 26, 1911, the United States of America filed a petition in the United States District Court for the District of New Jersey against respondents other than Minnesota Steel Co., Illinois Steel Co. and The Lorain Steel Co., but making the Federal Steel Co. a defendant as the owner of all the capital stock of said three companies. Said petition alleged that United States Steel Corporation and said subsidiaries and the Federal Steel Co. constituted a combination in restraint of trade under the first section of the Federal anti-trust act of 1890 and a monopoly under the second section of said act, and prayed for an injunction restraining the further maintenance of said combination and monopoly and a decree dissolving the same and the said corporations respectively. The said defendants filed an answer denying the allegations of said petition, whereupon a large amount of testimony was taken by the respective parties, after which the cause was brought to a hearing before said court on such petition, answer and proofs. After due deliberation, the court on Sept. 15, 1916, made a decree dismissing said petition on the merits. The United States took an appeal from said decree of dismissal to the Supreme Court of the United States, which appeal was duly argued and resulted in the affirmance of said decree on the first day of March, 1920. The record of said proceedings in the District Court of the United States for the District of New Jersey and in the Supreme Court of the United States are now on file in the offices of the clerks of said respective courts and respondents are ready to produce and prove the same when and where this honorable commission may direct, and pray for leave so to do.

Respondents aver that in said cause, as appears by the record thereof, the following facts were found, established and adjudged as between the United States of America and these respondents, that is to say:

Findings of Supreme Court

(a) That respondents did not have a monopoly of the iron ore deposits, either in the Lake Superior District or in the State of Alabama or in the United States at large.

(b) That respondents did not own or control the ultimate iron ore supply of the United States.

(c) That respondents did not own or control a monopoly of the coal suitable for steel making purposes in the United States.

(d) That respondents did not possess a monopoly of the railroad and lake transportation systems which carry ore from the mines to the manufacturing plants of said subsidiaries or competitors or, through such systems as it did control, possess the power to monopolize the raw material from which steel is manufactured.

(e) That respondents did not own or control a sufficient amount of any branch of steel manufacturing to constitute a monopoly thereof, or so large a percentage as to constitute a violation of law.

(f) That respondents did not possess the power to fix or control, and did not in fact fix or control, the prices of steel or the products thereof.

(g) That respondents did not possess the power to either control or destroy their competitors.

(h) That respondents did not control the prices of steel products nor fix the prices charged by their competitors.

(i) That respondents did not either singly or in combination constitute a monopoly or possess the power to monopolize the steel trade in the United States or elsewhere.

(j) That competition in the manufacture and sale of steel and the products thereof in the United States was free and unrestricted by any agreement, combination or understanding between the manufacturers or sellers thereof.

Requested to Have Hearing in Milwaukee

MILWAUKEE, June 6.—The construction industries committee of the Milwaukee Association of Commerce has requested the Federal Trade Commission to hold a hearing in Milwaukee in its proposed investigation of the Pittsburgh plus question. Resolutions adopted by the committee say in part: "It has been represented to this committee by fabricators of structural steel that from \$6 to \$8 a ton is added to the cost of their product by the rolling mills through the operation of the so-called Pittsburgh plus method of pricing steel, and that they would be able to reduce their bids immediately to that extent if this practice were abolished." The resolutions were adopted as a part of the function of this committee to investigate the cost of building and to take such steps as it sees fit to bring about a revival of the building industry.

Pittsburgh Basing Point to Be Discussed

H. G. Pickering, counsel for the Western Association of Rolled Steel Consumers and W. L. Chandler, president the National Association of Purchasing Agents, will speak on "Pittsburgh Plus" at an open meeting of the Chicago Purchasing Agents' Association to be held at Hotel Sherman, Chicago, on June 9. The National Association of Purchasing Agents is an organization of over 4000 members. The Chicago Purchasing Agents' Association was the first to oppose the Pittsburgh basing point on rolled steel prices, having its first meeting devoted to the subject Feb. 19, 1919. The St. Louis and Milwaukee associations held similar meetings shortly thereafter and subsequently the national association took a definite stand in opposition to the basing practice and presented the following resolution before the Federal Trade Commission on Nov. 16, 1920:

"Resolved, That in our opinion all lines of trade could be stabilized by establishing a standard of cost finding plus a legitimate profit to sustain their industry and base the selling price at point of production according to supply and demand."

Evils of Picketing

WASHINGTON, June 7.—That picketing is wrong for the employee as well as for the employer was the statement of Judge Dan Thew Wright, former judge of the Supreme Court of the District of Columbia, at a hearing last week before a special sub-committee of the House District committee in connection with a bill introduced by Representative Blanton of Texas to prevent picketing. The measure is not believed to stand much chance of being passed by Congress.

Respondents aver that there has been no material change in the constitution, holdings, powers or practices, or in the relative capacity or output of the respondents or any of them since the said adjudication and the said dismissal of the Government's petition; that the matters of fact so as aforesaid found, established and adjudged in said cause were each and all of them within the issues joined and tried therein, and respondents plead the said findings and adjudication in bar of the allegations contained in paragraphs 4, 5, 7, 8, 9, 10, 11 and 12 of said complaint to the contrary thereof.

XIV. Respondents further submit that an order of the kind or effect suggested in said complaint would be unwarranted by any law of the United States; that such an order would constitute an interference with respondents' liberty of contract and would amount to the taking of respondents' property without due process of law, contrary to the Fifth Amendment to the Constitution of the United States.

WHEREFORE, respondents pray that said complaint may be dismissed.

WILLIAM W. CORLETT,
Attorney for respondents.

RICHARD V. LINDABURY,
CORDEMO A. SEVERANCE,
of counsel.

Judge Wright declared that picketing is "nothing else but concerted coercion." He said that the public is against it, and that it is bad for the unions, because in order to win they must have support. In characterizing picketing as coercion, he stated that when employees have a grievance against any particular concern, they have a right to publish it in any way they see fit, but when this publication assumes the character of coercion, it is wrong.

Judge Wright said that the only time when peaceful picketing has been upheld was when prosecution has been brought under municipal ordinance, such as disturbing the peace, blocking the sidewalk, etc., and not with reference to an anti-picketing law. The court upholds the right of the employer to exclude union men in the selection of employees, if he so desires, it was declared.

"There is no question," Judge Wright added, "of the right of the men to be unionized. The employer has a right to exercise his preference in the selection of employees in the conduct of his own business. If the public recognizes the right of men to organize a union, it must recognize this principle."

Failed to Agree

The conference at Atlantic City between the Western Bar Iron Association and the Amalgamated Association of Iron, Steel and Tin Workers adjourned last Saturday without agreement on the new wage contract. The present agreement expires June 30. In the meantime, further efforts will be made to negotiate a new contract covering the bar iron scale. Employers asked the elimination of a number of extras and the 15 per cent advance on 1.50c. iron and higher, which was granted last year.

Conferees are considering the sheet and tin mill wage scales this week, representatives of the Amalgamated meeting with manufacturers who are members of the Western Sheet and Tin Plate Manufacturers' Association.

The Massachusetts State Employment office reports an increase in orders for employees of 3 per cent in May, as against April, but a decrease of 46 per cent as compared with May, 1920. People wanted by employers increased 14 per cent over April, and decreased 50 per cent as contrasted with May, 1920. Positions filled increased 13 per cent and decreased 36 per cent respectively. The principal demand in the men's skilled department was for painters and easily satisfied. There is an occasional call for men in the building lines, with the supply far exceeding the demand.

Modern Steel Works Power Plants¹

Centralization and Economy of Units Stressed
—Attention to Details Urged as Source of Savings—Waste Heat Boilers—Preheated Air

BY WALTER N. FLANAGAN

MOST of the new plants show to some extent investment efficiency, that is, greater capacity is being obtained from a given amount of equipment; practically all show labor efficiency, in that each new plant built produces more boiler horse power or more kilowatt hours per man than older plants. It is now realized that the greatest fuel saving with present equipment can be obtained in the boiler room, and that more care is needed to maintain that efficiency than anywhere else in the power plant. Efficiency of product is obtained in various ways, one of which is superheating the steam, thus rendering a given amount of heat able to produce more work.

Investment, fuel and labor efficiency are all increased by the use of large boiler units, as less space is required for a given capacity; the radiation loss is lower, since the wall exposed surface is less per boiler hp. with modern stokers or other fuel burners one man can handle one or more large units with almost the same facility as the same number of smaller units; and control apparatus, instruments, and attention can be applied to a large boiler at a much lower cost per boiler hp. than to a small one, and these pay big dividends on a small investment.

Importance of Boiler Settings

The design of the boiler settings has become the subject of as much study as the open-hearth furnace. This is due to the number of factors which must be taken care of in the case of a large boiler to be operated at high ratings. The setting of the boiler can limit its capacity and economy by limiting the flame temperature that can be maintained in the combustion chamber. This means that excess air is used merely to keep the brickwork cool; for the same reason, the total heat that can be generated in the combustion chamber

¹From a paper presented at the regular spring meeting of the American Iron and Steel Institute in New York, May 27. The author is steam engineer, Ohio Works, Carnegie Steel Co., Youngstown, Ohio.

is limited, and therefore the capacity of the boiler. Unless expansion and contraction are cared for, large cracks open up every time the boiler is cooled off, and even during operation, on account of the great difference in temperature between the inside and outside wall surfaces. The walls bulge inwardly and eventually fall in. With forced draft stokers, the jet action of the flame cuts grooves or niches in the walls and the spouting or piled-up ash adheres to the side walls until it interferes with the movement or distribution of the fuel bed, causing excess air and unburned fuel loss.

The following table shows losses resulting from air leakage in actual operation in one modern gas-filled boiler plant under test conditions, most of the excess air being due to infiltration.

Effect of Excess Air in Blast Furnace Gas Fired Boilers, Showing Percentage Loss in Boiler Efficiency for Various Percentages of Excess Air

Stack Temp.	25%	50%	100%	125%	150%	175%
500° F.	1.50	3.00	6.03	7.53	9.04	10.50
550° F.	1.69	3.39	6.78	8.47	10.14	11.84
600° F.	1.88	3.77	7.53	9.40	11.30	13.18
650° F.	2.03	4.07	8.13	10.20	12.20	14.25
700° F.	2.24	4.48	8.98	11.20	13.45	15.70
750° F.	2.41	4.82	9.65	12.05	14.50	16.86

Ten per cent difference in efficiency in a 1300-hp. boiler amounts to \$15,000 or more difference in fuel cost per year, while a complete steel casing could be installed for about \$5,400. The latter figures are based upon 14-in. plate, riveted and calked, and covering not only the four sides but also the top of the boiler. This would last as long as the boiler and require practically no repairs. A cheaper casing, which would save the above losses, could be installed for half that amount, but it would need considerably more attention.

Waste Heat Boilers

The fact that enormous quantities of heat are thrown away in steel works is clearly recognized. The only question is, does it pay to install means for saving this heat; does the expense of installation and of the

operating costs more than overbalance the saving? The fuel to melt and heat steel has in many cases been better utilized by the installation of waste heat boilers, since that is at present the most logical method of preventing this waste.

Waste heat boilers early acquired a bad reputation in many plants, which upon analysis seems due, in addition to improper selection of equipment, to poor installations, i.e., cramped, dark and inaccessible locations, too light or too small fans, air leakage and poor auxiliary equipment.

Some of the more modern installations have been very successful on account of the following:

Proper location for room, access and repairs; preferably grouping to insure attendance.

Proper selection of boiler and setting with a view to obtaining an air-tight setting.

Use of steel jackets, or the coating of settings with plastic covering. On account of high draft in waste heat boilers, namely, boiler draft loss plus furnace draft, the amount of air leakage is far greater than on separately fired boilers, unless settings are tight.

Selection of rugged fans and drives of ample capacity. Fans can now be obtained that will not require inspection or overhauling any oftener than the source of waste heat.

Installation of special boilers, designed particularly for waste heat service.

Installation of reliable accessories, such as feed water regulators in duplicate, thus reducing attendance and danger to the minimum.

Attention to and means for cleaning.

In most plants where the waste heat is not utilized, the boiler power has to be developed by burning coal. In the modern coal-fired boiler plant the cost of the boilers and settings amounts to only 20 per cent of the total plant cost. Waste heat boilers require no expensive buildings with coal bunkers, no coal and ash handling systems, including the requisite space, and do not require wide spaces between boilers or between boilers and walls for operating. They also require no stokers, ash pits, or forced draft fans. Therefore, even if a coal-fired plant can be operated at an average rating of 200 or 250 per cent and waste heat boilers can average only 70 per cent rating, it still pays from purely an investment standpoint to install waste heat boilers, on account of the saving in auxiliary equipment and buildings, even though more heating surface has to be installed.

Heaters to Preheat the Air

The use of preheated air is not new, neither is the idea of its use in connection with boilers, but until recently it was very little considered, probably on account of the low price of coal. The air heater for a boiler must not be confused with the recuperator on a heating furnace, where extremely high temperatures make its life short and require a fairly expensive construction, although even here it pays good dividends if properly taken care of. In connection with boilers the tubes are required to handle gases at from 500 to 750 deg. Fahr., as against 1300 deg. or more in a heating furnace.

The advantages of the air heater over an economizer are—cheaper and lighter construction, no pressure to resist, small building space, freedom from soot or dust, and safety. With fairly clean blast furnace gas no dust adheres to the tubes, if properly designed, i.e., if gas velocities of over 300 ft. per minute are used and the tubes are vertical. One air heater has been in operation for two years with no deposit of dust on the tubes.

Gas Burners Not Always Satisfactory

Increasing attention is being paid to burners. The ordinary burner requires constant adjusting to proportion the air supply to the varying gas pressures. Even if this is watched closely, such burners do not attain thorough enough mixing to insure combustion before the gases strike the tubes, unless the combustion chamber is abnormally large, with consequent radiation loss. The unburned gases are chilled, thus either burning in

the last pass, causing high stack temperature, or causing high CO in the stack gases, with accompanying loss, or both.

Recent burner development is along either of two lines: first, with an aspirating type of burner which uses the gas velocity to draw in the correct amount of air for combustion at all ratings; or secondly, an air fan combined with an automatic regulator to supply air to the burner independently of draft, and in correct proportion to the gas flow. In both cases the air and gas ports are subdivided, giving alternate thin layers of air and gas, and attention is given to securing proper gas velocities for thorough mixing. The second type of burner is fairly complicated and expensive where there are numerous small boilers, but is well worth the expense for large units. The aspirating burner is well adapted to small units, as it can be installed for very little more than a common "gas feeder," requires no expert attention, and has no maintenance costs.

For example, a 300-hp. boiler at about 120 per cent rating equipped with goose neck burners, while running with 6 per cent oxygen showed 2 per cent CO in the stack, and a stack temperature of over 800 deg. Fahr., or a boiler efficiency of approximately 46 per cent. Equipped with aspirating burners, the same boiler averaged day after day 23 per cent CO₂, no CO and 600 deg. Fahr. stack temperature, giving a boiler efficiency of 73 per cent.

Efficiencies Possible With Good Burners

The curves in Figs. 1 to 7 show boiler efficiencies when burning blast furnace gas with various flue gas analyses and stack temperatures. They also show the efficiencies possible with good burners, proper baffling of boilers, and by economizers or air heaters. Seventy per cent efficiency is being obtained by modern burners under ordinary installations of small boilers, while higher efficiencies are obtained with larger units and boilers with longer gas travel.

The following shows how well it pays to install efficient burners, even in an old installation with only a few years more life. A 400-hp. boiler at 125 per cent average rating equals 500 boiler hp. If the boiler efficiency is increased only 10 per cent, say from 60 to 70 per cent efficiency, which is quite possible, as seen from the curves, the saving per hour is:

$$\begin{aligned} & (\text{tons of coal per hour at 60 per cent}) - (\text{tons of coal per hour at 70 per cent}) \times (\text{price of coal}) = (\text{saving}) \\ & \left(\frac{500 \times 33479}{0.60 \times 13500 \times 2240} - \frac{500 \times 33479}{0.70 \times 13500 \times 2240} \right) \times \$5.00 \\ & = \$0.66 \end{aligned}$$

At 300 days of operation, the saving per year is $300 \times 24 \times \$0.66 = \$4,752$.

Aspirating burners for a 400-hp. boiler can be installed complete at present prices for \$800. Thus there is a yearly saving of about 600 per cent on the investment, and no repairs ever to be charged against the installation. In addition, there is a saving in labor, since hand regulation is practically eliminated. The 10 per cent saving is very conservative, as the difference between ordinary and good burners is usually higher, due not only to better combustion, but also to lower stack temperature on account of quick combustion. Because of rapid combustion and with dry cleaned gas, higher capacities are obtainable from the same setting, and troublesome boilers can often be eliminated by the installation of modern burners under the other boilers.

Pulverized Coal Theoretically Ideal

It has often been suggested that the future utilization of coal for power will consist entirely of the manufacturing of coke in by-product ovens, the gas being used in engines or as domestic fuel, and the coke being burned under boilers, full value of all the by-products being realized. This scheme is entirely logical, but at the present price of coal and demand for by-products it is not as yet attractive to power plant owners in this country, whether steelworks or public service corporations, on account of the tremendous outlay involved. Coke ovens are used only where there is a direct demand for coke or gas.

Theoretically, the next most nearly ideal way is to

burn the coal in powdered form. With this system cheaper buildings, excellent control, perfect mixing, and elimination of ash and excess air losses are obtainable, as well as extremely high efficiencies by the use of air heaters which are considerably less expensive than economizers. However, due to operating difficulties encountered, these advantages are not being fully attained in boiler practice.

When powdered coal is burned with the theoretical amount of air, a very high flame temperature is produced, which is hard on brickwork and which liquefies the ash produced. To eliminate brickwork trouble, and also the liquid ash, which in earlier installations coated the tubes, large quantities of excess air were used which did away with some of the operating trouble, but also with one of the advantages, namely, increased efficiency due to the elimination of excess air loss, which amounts to from 5 to 10 per cent in an average stoker installation.

How Powdered Fuel Should Be Used

The ideal and readily attainable installation will consist of a combustion chamber not any larger than for stoker practice, the burners being pointed downward, allowing the flame and gases to reverse through 180° before striking the tubes. The burner should be so designed that velocities above the critical will be obtained, which will give good mixing and perfect combustion with practically no excess air. The boiler should be equipped with integral air heater at the stack, using the heat in the waste gases.

The high flame temperature will slag a large part of the ash, which will be dropped into the bottom of the combustion chamber, from which it can be run out in liquid form. The balance of the ash will pass through the boiler and out of the stack, or can be removed in powdered form from soot pockets in the setting. The combustion chamber walls can be protected by passing the air from the air heater through them.

The present disadvantages of pulverized coal are:

- (1) The initial expense of the pulverizing plant required.
- (2) The labor necessary to operate safely the pulverized coal installation is as great as for stokers, unless the installation is very large.
- (3) Danger of explosion or spontaneous combustion.
- (4) Pulverized coal bins are required at the furnaces or boilers.
- (5) Feeders and fans require power, same as stokers.
- (6) Present feeders do not proportion correctly, i.e., for a given speed the feed varies due to different density, or aeration, and to varying moisture and fineness of coal.
- (7) High cost of pulverizing.
- (8) Coke breeze cannot be pulverized economically on account of its abrasive nature.

Engines and Turbines

To obtain the economies of electric drive in the steel works, and to meet the increasing electrical demand, larger turbines are being installed than formerly. While there are no exceedingly large units in steel plants, still there are many installations of from 10,000 to 20,000 kw., which sizes give good economy and compare quite favorably with central station practice. Units up to 45,000 k.w. in a single casing, and up to 60,000 k.w. in a three-casing machine, have been installed in some of the largest central stations, but turbines of this size are not required as yet for the steel industry on account of the immense amount of steam-driven equipment in the plants and the desirability of having spares rather than tying all of the generating capacity up in one large unit.

The same conditions that have increased steam pressures for turbines and fostered the use of electric drive have caused pressures and temperatures for engines to approach those used in turbine practice. For instance, the latest reversing engine installation is designed for 225 lb. per sq. in. pressure and 125 deg. Fahr. superheat at the throttle. A noticeable feature of this engine is its simplicity and accessibility.

While the twin-tandem engine is standard in the United States at present, it seems as though, in order fully to utilize higher pressure and superheat, triple-tandem compound or multi-cylinder uniflow reversing engines may be the future competitors of electric drive. Triple-tandem engines have the advantage of lower inertia forces, in addition to being better able, on account of smaller cylinders, to use higher pressures and temperatures. Reversing uniflow engines have been built for locomotives and for boats, but not as yet for rolling mills in this country, although the manufacturers appear to be willing.

For continuous running mills the uniflow engine is rapidly coming into prominence. The early installations have shown great reliability, while the economy of the uniflow over wide load ranges is almost an accepted fact. In this country last year there were three new installations for driving rolling mills, two of which were duplex engines; also several electric power installations. Two 40 in. x 48 in. duplex uniflow engines, which have just been completed for hot mill drives, will develop an average of 2500 hp. and a maximum of 5000 hp. each. Two more uniflow engines, one a 28 in. x 42 in. duplex and the other a 40 in. x 48 in. single engine are now being built.

Governors have been developed with a very reliable and easily operated speed-changing device, so that all conditions of service can be met. In view of the numerous installations of electric mill drives, the status of the steam engine for roll drives appears to be dependent upon how much use is made of the economies to be effected by high steam pressures and temperatures, either by the use of pressure reducing turbines, or by direct application to the engine.

Blast Furnace Gas Engines

The modern blast furnace gas engine shows much greater reliability and a somewhat higher thermal efficiency than formerly; but the steam turbine plant, when high pressures and superheat are used, and all auxiliaries, such as gas washers, are taken into consideration, runs a pretty close second in regard to economy, and can be installed at a much lower figure. However, all of the possibilities of the gas engine have not been taken care of, although some work has been done along this line in this country and considerable in Europe.

By utilizing the heat of the exhaust and the heat of the jacket water the thermal efficiency of the entire system can be made at least double that of the engine alone. In one plant in the United States the exhaust is to be used to run a high-pressure boiler; in Germany low-pressure boilers and low-pressure turbines are used to some extent. In another plant the equivalent of 100 boiler hp. per 3000 k.w. engine is obtained by a very simple and inexpensive air heater, which is used to heat the buildings and which increases the back pressure on the engine less than two in. of water. However, this last is used only in winter, and could be made more effective, as up to 300 boiler hp. is readily available from the exhaust.

The use of jacket water as boiler feed water is another method of improving the economy of the system, by saving the jacket water loss, and enabling the gas engine to compete with steam-driven equipment in spite of high first cost. This is already being done, and other installations are contemplated, in connection with economizers, utilizing the heat in the exhaust gas. This is an almost ideal source of waste heat, as the jacket water is not contaminated and the exhaust gases are quite clean. The only consideration is not to create too high a back pressure on the engine.

Discussion by Richard H. Rice*

This paper indicates that the economies which I set forth in 1917 as being possible of realization in steel mills are now being obtained. The period since 1917 has been one of intense endeavor in the production of existing types of apparatus. During this period serious difficulties have been experienced with the material

*General manager Lynn works, General Electric Co.

used in steam turbine construction, due no doubt to the demands for intensified production which have been made upon steel mills and other sources of supply of raw materials.

Our endeavors to secure high quality of the materials used in turbine manufacture have led to development of additional means of safeguarding the construction of turbines by a more thorough and accurate examination of these materials. For example, we have developed and put into commercial operation a mechanism for the magnetic examination of turbine wheels, which has been found to point out accurately any hidden defects of magnitude which may exist in such wheels.

We have also been led to investigate more carefully the stresses which occur in the rotating and stationary structures. In particular we have developed and extended the investigation of distribution of stresses by means of photo-elasticity. This is accomplished by testing transparent materials in various ways and passing through such material, when under stress, beams of polarized light.† Much information has been thereby obtained concerning the distribution and character of stresses in the structures involved in turbine design, and improvements have been made in our designs in accordance with these investigations.

New materials have been developed which are suitable for use in buckets and nozzles, which give freedom from corrosion or rusting, and at the same time, considerable increase in the elastic limit. In addition, means have been found to construct buckets of much lighter section, so that the buckets impose much smaller stresses on the turbine wheel rim. Refinements of construction have also been developed in various other parts of the turbine, such as the diaphragms. These result in more accurately formed steam passages, with consequent improvement in economy, while increasing the strength and reliability of the structure.

Measured Progress Along Lines of Efficiency

As regards the progress made since 1917 in the development of the steam turbine we find that (using the steam consumption of the best turbines in the year 1903 as unity) in 1917 the steam consumption had been reduced to 50 per cent and in 1921 it has become 48 per cent, a reduction since 1917 of 4 per cent. A further reduction is confidently expected.

The weight per kilowatt of large steam turbines, which in 1903 was considered as unity, was 28 per cent in 1917, and has now fallen to 25 per cent.

Since 1917 the initial pressure used in large steam turbines has not been increased, but installations are now in contemplation which will raise the pressure from 300 lb. per sq. in., reported in 1917, to 350 lb. now, these pressures being, of course, at the turbine. Boiler pressures will be some 50 lb. higher.

Since 1917 no marked increase has been made in the use of initial temperature of steam due to superheat, but it is expected that instead of 650 deg. in use in 1917 we shall before long be using 750 deg.

The point in which we are chiefly interested, in discussing the improvement of power plants in general, is the heat consumption for the complete electric station. The curve showing this figure shows decrease in the heat consumption, bringing it down from 16,300 B.t.u. per kw.hr. in 1917 to 15,000 B.t.u. in 1921. To show that these figures are not optimistic, the monthly average of an actual plant, of rather small size and not on particularly steady load (since the average is a monthly one), indicates a consumption per kw.hr. of 17,130 B.t.u.

Plea for Larger Use of Electric Drive

Use of steam driven equipment scattered over the plant is not a desirable feature from the standpoint either of economy or of operation. The place to generate power for the plant is in the power station, and electrical transmission and electric utilization of this power is undoubtedly the method which is not only the most economical but also the best from the operating standpoint, having reference both to reliability and ease

of handling. While great progress is being made in steel mills in the direction of substituting electric power for steam, air and other methods of transmission, there is yet a long distance to go before the mills will be in an ideal position in this matter.

Considerable improvement has been made in the efficiency of the turbo blower by the use of a high-class multi-stage turbine as a driver. An installation of this character, which is one of three units now in service on a blast furnace plant, uses 17 per cent less steam than those on which my computations were based in the 1917 paper.

In considering the proposal to utilize the heat in the jacket water and in the exhaust of gas engines, as a means of increasing the thermal efficiency of the gas engine system, the cost of this auxiliary apparatus, installed, and the cost of operating and maintaining it, should be carefully considered and proper charges for interest, depreciation, maintenance and operation set up as an offset against the increase of efficiency.

It is poor economy to submit to low vacuum conditions in condensing systems, as well as to the other disadvantages which often arise from the use of high temperature and impure river waters in the case of steel mills located on rivers where the temperature of the water is high and the quality is poor. Such mills will realize a substantial gain by the use of spray ponds and other means of securing the advantages of a closed system of water circulation. With this system the small quantities of make-up water needed can be treated at moderate expense. A considerable improvement in the vacuum realized in the surface condenser will result.

Recommendations to Promote High Economy

To summarize the requisites for high economy in a steel mill power plant using steam:

- For the turbines:
 - High pressure—300 to 350 lb. per sq. in. initial pressure.
 - High superheat—to total temperature of 650 to 750 deg. Fahr.
 - Lowest possible vacuum, secured by surface condenser and clean circulating water (if necessary by a closed circulating system and even spray ponds).
 - Large turbine units, which have appreciably higher efficiency, both in fuel and in fixed charges.
 - For the boilers:
 - Reasonable ratings for normal load, not over 200 per cent, with high rating for peak load. Steel jacket settings to reduce air leakage into furnace.
 - Large stoker areas and few turns in boiler passes, with resulting small draft losses.
 - Best possible gas burners and dry cleaners for gas.
 - Large boiler units.
 - Automatic control.
 - Steel tube economizers.
 - Air preheaters.
 - For the surface condensers:
 - Save all condensate, treat and de-aerate all make-up water.
 - For the feed water:
 - Heat by extraction from the main turbines or from the house turbines, in series in closed heaters, to secure maximum work from the heating steam.
 - For the auxiliary apparatus, pumps, fans, etc., in the boiler room:
 - Electric motor drive from a house turbine or turbines.
 - For all apparatus about the mill such as hoists, cranes, charging apparatus, etc.:
 - Electric motor drive and control.
 - Finally:
 - Centralized power stations where all power is generated, to be transmitted electrically about the mill.
 - For the blast furnaces:
 - Turbo blowers with accurate governing of air volume, corrected for barometer, temperature and humidity, one blower for each furnace.
- In all cases the determination of value of apparatus and installation should be based on actual costs of operation, including fuel, labor, maintenance, depreciation, and interest charges.

Discussion by Arthur West*

It is the purpose of this discussion to cover briefly the improvements in gas power plants for steel mills. Three principal points worthy of attention are:

1. First cost of plant.
2. Relation of water supply to choice of gas or steam power plant.
3. Possibility of regular operation of gas plant with only one furnace in blast.

First Cost Discussed for a Concrete Case

Regarding first cost it should be noted that the gas engines and generators represent less than two-thirds

†General Electric Review, page 869 and 870, Nov., and page 960, Dec., 1920; page 82, Jan., page 222, March, and page 455, May, 1921.

*Assistant general superintendent Nicetown works, Midvale Steel & Ordnance Co., Philadelphia.

of the total cost of plant. It has been our experience that careful study of the layout of the gas cleaning plant and gas power plant in their relations to each other greatly reduces the total cost of plant by simplifying the building, excavation, piping, etc. The cost of a plant will vary considerably in different localities, according to whether or not it is necessary to drive piles for engine and building. I have prepared below a carefully itemized statement of cost of a complete 21,000-kw. gas power plant as follows:

	Cost per Kw.
1. Six 3500-kw. twin tandem gas engines with six 4000-kva. alternating current generators, all erected complete	\$80.00
2. Power house building of steel, brick and concrete with tiled floors and vitrified tile three feet high around walls. Included in above is a steel and concrete building for gas washing apparatus and all excavation and foundation work for above buildings, but no piling	13.45
3. Excavation and foundation for gas engines and generators	4.12
4. All gas washing apparatus needed to prepare the raw furnace gas for gas engine use	4.40
5. All switchboard and electric apparatus in power house, but not including any sub-stations	5.00
6. All air, gas, water and exhaust piping in power house, including exhaust stacks	2.87
7. Miscellaneous items, crane, railroad tracks in building, etc., oil tanks in building, and all other apparatus in building needed for successful operation	2.88
8. Gas holder of 200,000 cu. ft. capacity	2.98
9. Engineering and drafting	1.20
10. Unforeseen contingencies	\$10

Total cost of station ready to run, exclusive of real estate \$125.00

Some of our stations built during the war cost much less than the figure given, notwithstanding the fact that the gas engines were included at current selling price and not at our actual cost to build. All the various items quoted have been carefully modified to represent present day costs. They include all apparatus needed to clean and purify the raw gas as it leaves the furnaces, and also one gas holder of 200,000 cu. ft. capacity, the latter for a special purpose to be later described.

In these days of high capital charges the first cost of the station is of great importance. Since the figures here given include absolutely all auxiliaries, any comparison made with a steam plant should also include absolutely all auxiliaries such as boilers, furnaces for gas firing, economizers, stacks, feed-water apparatus, water softening plant, condensers and circulating pumps, turbines, etc. When this is done it will be found that there is no such discrepancy in the first cost of a steam and gas station as was formerly thought to be the case. The reduction in first cost of the gas station has been brought about in the same manner as in the case of the steam station, viz., by increasing the size of the power units and carefully studying the layout of the whole plant.

Water Supply for Steam and Gas Plants Compared

In many cases around a steel mill the water supply is either deficient in quantity or bad in quality. For such cases the gas station has a great advantage. By the use of cooling ponds or, where space is limited, by employing cooling towers, both the gas cleaning water and the gas engine jacket water may be used over and over again, the gas cleaning water and the engine jacket water being of course separately cooled. The water for gas plant does not require treatment and the only loss of water is that due to evaporation.

In the case of a steam plant, to produce a 28-in. vacuum with cooling ponds or towers requires 5.7 times as much circulating water as is required for the same gas power plant, including water for cleaning and cooling gas as well as engine jacket water. The make-up water required by such a steam plant with surface condensers is 3.5 times that required by the complete gas plant. With surface condensers the condensed steam is just about equal to the evaporation loss in cooling ponds, so that the new water required is practically the amount of the boiler feed. Where water is expensive these gains are important.

It should also be remembered that, to produce 28 in. vacuum, the cooling ponds or towers must cool the water from (say) 110 deg. Fahr. to 85 deg.; while the cooling ponds or towers in the case of the gas plant

must cool it from (say) 155 deg. to 110 deg. The cooling pond is much more efficient at the latter temperature range than at the temperatures needed for vacuum producing. This, together with the fact that the gas cooling ponds or towers are called upon to handle less than 20 per cent of the water per kw. required for the steam plant, renders the cooling water plant and its auxiliaries very much less expensive than in the case of a steam turbine plant.

There are many cases around a steel mill where, even if water be obtainable, the cost of intake and other hydraulic arrangements is greater than cooling ponds or towers. With very muddy streams, or those subject to great seasonal change in flow, this is especially apt to be the case. Such considerations sometimes enormously affect both the first cost and the operating cost of a power plant. In every case we should consider all the elements entering into the production of kilowatts at the switchboard from raw gas at the furnace.

Gas Engine Operation with One Blast Furnace

It used to be thought that gas engines could not be used unless the plant consisted of three or more furnaces. Even with two furnaces in blast there was difficulty in operating gas engines reliably, due to possible changes in gas pressure while one furnace was casting. At our Sparrows Point plant we have for several months had only one furnace in operation. In this plant the demand for power does not, unfortunately, decrease with the requirements for pig iron. The cost of blowing furnaces and generating electric current by gas engines is so very much less than the cost of either doing the work by steam or purchasing power outside that our engineers at this plant had a strong incentive to keep the gas engines going on one furnace, a feat hitherto considered impossible to perform with safety. The difficulty has, however, been surmounted in the following way, which we hope to have more fully described later in a paper especially devoted to the subject.

Briefly, a gas holder of 200,000 cu. ft. capacity is connected to the gas main supplying the gas engines, by a pipe provided with a gate valve controlled by the pressure in the gas main at the engines. When this gas pressure falls below a predetermined minimum (which happens while the furnace is casting) the valve leading to the holder is automatically opened, thus preventing the gas pressure from falling below holder pressure during time of cast. When the furnace cast is over and gas is again going into the mains the valve leading to the gas holder remains open until the pressure reaches a predetermined maximum, this being reached only when the holder is full. When the gas pressure has thus reached the top limit the valve leading to the holder is automatically closed. The full holder is thus constantly in reserve, to keep the gas pressure at engines between the desired limits.

This apparatus is so successful that, for several months past, with only one 500-ton furnace in blast, we have been continuously operating four 3500-kw. gas-electric engines and the two 47 and 84 by 60-in. gas blowers required to blow the furnace. These six gas engines were thus developing about 24,000 brake hp. continuously from one furnace, without the aid of any steam apparatus whatever. Recording charts show that the gas pressure at engines never fell below 5 in. of water.

This arrangement has been in operation about four months and has proved thoroughly safe and practical. With this device it is evident that gas engines can be installed in any blast furnace plant, no matter how few the furnaces. This we feel is a radical step forward in the development of gas power around steel mills. The operation of this device at Sparrows Point has produced a saving over steam or purchased power at the rate of over \$400,000 per year.

"Ready for a Slide" is the caption of a poster sent out by the National Safety Council, Chicago, the photograph representing foundry flasks piled helter skelter. The text reads: "Poorly piled flasks are dangerous. A slight jar is liable to send one or more of the flasks sliding and they may strike you or a fellow workman passing by."

MANY CONCESSIONS

Buying Awaits Lower Prices Based on Lower Costs in the Mahoning Valley

YOUNGSTOWN, OHIO, June 7.—Buying of iron and steel products is being held in abeyance largely until prices based on lower costs are realized. Pipe production of one district interest is devoted at present to small material to be used in construction enterprises. Another Valley maker is turning out an order for heavy sheets, the product to be used by a motor builder for pressed crankcases. Concessions are being granted by producing interests on virtually all finished commodities, though on small orders nominal quotations are generally upheld. Sales departments are combing their respective territories for new business, but few sizeable tonnages are coming out.

One steelworks interest reports that a quotation of \$20 was made for a small lot of off-grade basic pig iron. The nominal asking price for standard basic is, however, from \$21.50 to \$22 in the Mahoning Valley.

In view of the general absence of buying, a veteran steel maker expresses the hope that there will be no deviation from the policy of mutual helpfulness and consideration which has marked the industry in times gone by and that there will be no revival of cut-throat competition such as has prevailed in some other periods of stress. He attributes the present somewhat critical condition of the industry, insofar as buying is concerned, to the sudden expansions during the war beyond the immediate requirements of the country. Normal needs, he states, will soon absorb this enlarged capacity.

In the Youngstown district the more important producing groups are well fortified financially and could weather a depression of prolonged duration. An indication of the attitude of the leading makers with regard to the immediate future is that they are making every effort to keep their operating organizations intact.

SURPLUS STOCKS

Shipyard Steel Has Demoralizing Effect on Seattle Market

SEATTLE, June 1.—The flotation of surplus stocks of steel from the Skinner & Eddy shipyard, dismantled after the close of the war, has dislocated the market on many articles of steel and machinery in this territory. The stock has been parceled out to more than a dozen dealers, who are issuing price lists and endeavoring to dispose of the stock on the small parcel basis. The sale of considerable new stock has therefore been stopped.

The fir lumber mills, expecting a revival of the Eastern demand for lumber in August as representing the fall buying, have built up some good prospects for machinery, especially in large lathes. In many instances jobbers have secured the indorsement of purchasing agents for these mills on spot basis, but when passed on to the heads for approval there has been a halt. There is a brisk demand for cylinder regrinding tools for the automotive trade, the early summer having brightened considerably in the Northwest trade.

Due to agitation of taxpayers on the high cost of the school maintenance and a determined demand for retrenchment, the orders for machinery and tools for vocational and manual training technically placed last winter have been held up. The purchasing departments of the schools have accordingly been making some inquiries for used tools and machinery and have had about \$1,000,000 of stock thrown at them, the bulk of which will come out of the shipyard stocks. Investigation by jobbers shows that there are more machinery and tools in the three shipyards assemblies now in the process of cleaning up than had been surmised, and competition of this sort is feared throughout the summer.

There is a brisk inquiry from the lumber mills for welding tools.

Sales executives state that steel consumers are disappointed by the comparative smallness of the wage reduction for railroad employees. The improbability of any early substantial lowering of freight charges is also acting as a deterrent.

There is no longer any question as to the instability of sheet quotations and concessions from the nominal prices are now generally accepted. Reductions have likewise been made on plates, strip, wire products and semi-finished material ranging from \$2 per ton on plates to as high as \$20 a ton on cold strips.

Certain large producing interests believe the market is tending toward lower levels and there is not the disposition to maintain existing prices which prevailed a month ago.

An interesting fact in connection with the current situation is that jobbers in many instances are handling a relatively larger volume of business than the makers, owing to the large amount of small-lot buying.

In the current market sheets, plates and wire products exhibit the least strength. Quotations on black common sheets as low as 3.50c. are heard. Full-finished sheets are in relatively fair demand, compared with the common grades, all of the inquiry coming from automobile makers. A non-integrated maker of deep drawn stock, for instance, has consistently maintained better operating schedules in this district than the larger, self-contained producers.

Though current tin plate orders are being filled by a district maker from stock material, nevertheless the market shows signs of some betterment, says an official of the company. The opinion prevails that a demand is accumulating which will result in greatly accelerated activity in this branch of the industry before the year ends. The bulk of the current inquiry is from condensed milk interests, the ordinary seasonal requirements from the fruit and vegetable packing industry having failed to show strength. A price as low as \$5.50 has been done on stock tin plate.

A base of \$3 for wire nails generally prevails in this territory.

The Barde Industrial Co. has bought ground in the industrial section of the city on which will be erected warehouses for the housing and handling of steel and machinery carried by the corporation. Contracts for the buildings have been awarded and operations will commence August 1. About 60,000 sq. ft. will be occupied by the grounds and buildings, with an outlay of \$250,000 for buildings alone. It is announced that 10,000 tons of steel, including bars, plates, beams and tool steel, all embraced in a large department are among the stocks to be kept. About 1,000,000 ft. of wire rope will be carried, in sizes from ¼-in. to 2 in. This department is expected to be the largest on the coast. Pipe, electrical tools, and rails will be prominently featured.

The Japanese steamship Moraisan Maru of the Mitsui fleet arrived in port to-day and will load 1000 tons of steel pipe for the Orient.

The Platt Wonder Pump Co., established here a year ago, has moved to large quarters, taking over the building formerly occupied by the Machinery Co. of America. Fifty expert mechanics have been employed. Officials of the company state that the domestic trade outlook is good. Five Northwest cities, King (Seattle) county and the Federal Government have recently purchased Platt pumps for waterworks systems.

Following a conference between purchasing agents of Pittsburgh and Youngstown, it was decided to hold the June meeting of the Purchasing Agents' Association of Pittsburgh in Youngstown on June 21. The members will visit the plants of the General Fireproofing Co. and the Republic Rubber Corporation during the day and will enjoy a banquet in the evening.

The Vacuum Oil Co. says it is not true that it recently purchased 1,000,000 oil barrels, as stated in THE IRON AGE of May 12.

Freight Rates and Business

The unwise proposal has some support in Washington, that there be a horizontal reduction in freight rates. Were such a method of revision adopted the experience of many years before the war would go for naught, for to reduce rates horizontally would be yielding to popular talk that has nothing in it. The remark has been as widespread as it is groundless that business recovery is prevented by freight rates being too high. Surely a lesson should be drawn from the experiences before the war. We had ups and downs in business then, and in times of depression most of the allegations of causes proved unfounded, while most of the remedies proposed were found to be of no value. With particular insistence we heard at times that business would never be good until freight rates were advanced. Now we have been told that trade will not be good until freight rates are reduced. It is a psychological phenomenon, not a business diagnosis.

The idea of a horizontal reduction in freight rates misinterprets much of the talk that has been heard on the railroad problem. A readjustment or harmonizing in wage rates was requisite, as part of the industrial readjustment, and reductions in railroad wages were urged partly as an aid to completing readjustment in certain other lines. In the building trades in particular there has been crying need for wages to come down and working conditions to be modified along the line of efficiency and harder work; and to maintain an unreasonable wage basis on the railroads would retard the readjustment in the building trades and at other points where adjustment was needed.

We are in too serious a situation to let men nurse their grievance against the policy some railroad men used to follow in the old days, of charging "all the traffic will bear." It cannot be helped if it hurts the feelings of some men to adopt this policy, to an extent, in arranging freight rates in the future. It should be sufficient salve that the policy is adopted for the economic good of the country instead of for the financial benefit of individual railroads. According to the policy, a horizontal reduction, or anything approaching a horizontal reduction, would be the

worst way to settle the matter of freight rates.

If the volume of railroad freight traffic were studied it would be seen that it does not show the depression to be as great as is conceived by those who think to increase the volume of business by reducing all freight rates. For instance, the freight ton-mileage last February was at a rate approximately equal to the average rate in the best year before the war, yet February is normally a month of traffic under the year's average. It is quite idle to expect to effect a great increase in freight traffic purely by the method of reducing freight rates in general.

As a remedy along psychological lines, reductions in freight rates are altogether to be commended, but if that is the case the reductions should be made chiefly in the rates that the public has found by concrete example to be plainly burdensome. It cannot be shown that all freight rates are too high for the total volume of business in the country to be what it used to be, but it has been shown plainly that certain rates are altogether too high to permit the lines of business involved to be conducted with facility. Those are the rates that should come down.

The increasing use of giant dirigibles of the R 34 type is brought to notice by the employment of one of them last week as a regulator of traffic for the British derby at Epsom Downs. From a height of some 2000 feet it was possible by wireless to direct automobile and vehicular traffic, which was unusually heavy because of the coal strike and lack of rail transportation. Of more practical interest are the figures for the exports and imports moved by air craft. Already the British Government has issued reports of foreign trade carried on by air transport, and its growth, in the periods compared was very large, imports from France having been the heaviest. That aircraft will play no small part in international trade, particularly among European countries, seems assured. The possibilities in the United States are not so great, but ultimately the commercial airship may be a carrying agent not only between this country and Mexico and Canada, but also to South America. Steel, metallic products and other materials will ultimately find speedy transportation, and exports and imports

by aircraft will become a regular feature of statistical reports here and abroad. The electric furnace and the isolation of aluminum and magnesium are the main factors in this development, the combination of these light metals with themselves or with other metals, made stronger by heat treatment, being responsible for these giants of the air.

Outlook for the Eight-Hour Shift

As Mr. Schwab pointed out at the recent meeting of the American Iron and Steel Institute, if the iron and steel manufacturers profit by their experience during the present period of depression, the result will be highly beneficial to the industry. Certain it is that operating departments are having unusual opportunities for testing new methods. One of these opportunities is found in the adoption of the eight-hour shift in some of the large steel plants. This action has been taken to furnish employment to a larger number of men, and in the case of a large Youngstown company it was stated that as soon as conditions permit the twelve-hour shift will be restored. This announcement undoubtedly was made because the management of the company did not believe it to be the desire of the employees to work permanently upon an eight-hour basis with the accompanying reduction in wages, but it is entirely possible that experience with the eight-hour shift will indicate a method which will be satisfactory to all concerned for putting it into effect permanently.

As stated in these columns last week, the speeding up of the open-hearth process is promised by two methods of throttling the air supply so as to complete a heat in eight hours which ordinarily requires twelve. If this is really accomplished, it will be an important factor in bringing about the eight-hour shift, for a complaint often made by open-hearth workers has been that with the eight-hour shift some of the men would carry the great burden of work connected with the tapping and charging of the furnace, while others would get off lightly. With the charging and tapping recurring more frequently and with the number of workers increased (even though by something less than 50 per cent) the inequalities in work performed would be lessened.

In a recent article in the *Atlantic Monthly*, Philip Cabot tells of the efforts his brother, the founder of the Cabot Fund, made in 1910 to bring about a reduction of hours of workers of the Steel Corporation and urges that this step be taken at the present time, but he frankly admits that a radical change of this kind would be doomed to failure if inaugurated at a period not adapted to it. He admits that conditions preceding the World War were not favorable for the introduction of the eight-hour shift and says that it is fortunate for the cause of progress and reform that changes of fundamental character were not attempted. He adds: "If in 1912 the officials of the United States Steel Corporation had entered upon such a course, they would probably have been forced to abandon it by the exigencies of war, with its huge demand for production and coincident shortage of labor."

It is hardly competent for one, not directly connected with manufacturing problems which would be materially affected by such a change, to say that

the moment has arrived for making it, but the attitude of some leaders of the steel industry is significant. Chairman Gary in his address at the annual meeting of the stockholders of the Steel Corporation, April 18, said the presidents of the subsidiary companies and a majority of others in positions of responsibility, were in favor of abolishing the twelve-hour day, and for this reason and because of public sentiment expected to decrease the working hours in the "comparatively near future." The outlook now is that the experiences of many plants and also the introduction of new methods will hasten the day.

Steel Production Costs

In periods of full employment for the steel mills there has been much reference to the low costs per ton attained. At such a time, when buyers are ordering or specifying for forward deliveries, mills are scheduled far ahead. Roll changes are infrequent, there are long runs on a given size or section and workmen endeavor to make new tonnage records.

Conditions now are absolutely reversed. Aside from the overhead per ton being particularly heavy on account of the light operation, small orders are being handled, nearly every order passing through the mill as a unit, necessitating frequent roll changes and making the amount of workmen's time per ton of output especially large. Apart from the factors of overhead and of high wage rates per hour there is this factor, greatly increasing the cost.

It has been urged often of late that industry has entered a period in which production costs must be governed by the selling prices obtainable, that if a manufacturer cannot sell his goods at cost he must reduce his cost until he reaches the point at which the buyer will place orders. There is something in this, as a general economic principle; but in the steel industry at any rate there are probably no manufacturers who require any further stimulus to the reduction of costs.

In one respect the production cost of finished steel is at the dictation of the buyer rather than at the dictation of the seller. In all business it is commonly recognized that when one purchases goods that are to be made "to order" he is properly asked to pay an extra price, because the cost is higher, and that goods sold at retail are priced higher than goods sold wholesale. While at one time or another a given specification for steel is made to order, there is essentially a great difference between adding the specification of a customer to a batch of specifications already in hand, for the size involved, merely adding the specification to the schedule, and making up a schedule for that one specification. There is also a great difference between selling a carload made up of numerous sizes or sections, all to be shipped within a very few days, and taking a specification for many carloads, when some of the carloads may be made up of a single size or section each and shipped at intervals according to mill convenience.

These things add greatly to the cost of production at this time, and they are things made by the buyer, who is getting goods made to order, and at retail. According to recognized principles of merchandising the producer is entitled to secure, if he can, his extra cost.

It is not good business to make retail sales at wholesale prices simply in expectation that eventually the retail business may grow to wholesale proportions. For the buyers to approach the sellers and say "We will become wholesale buyers if you will name us wholesale prices" is another matter. The steel trade has gone through this experience at various times in the past as, for instance, in the spring of 1909 and in the late weeks of 1911. Both buyers and sellers expect a repetition of the performance at some time in the future, the main question being when buyers will get in the position of being able to offer orders in such form as to reduce mill costs. With full mill activity costs would still be very high as compared with 1913, on account of wages and freight rates being much higher, but they would be materially lower than at present.

Checking the Census on Iron

When the Census Bureau places the 1919 products of blast furnace plants at \$794,467,000, compared with \$317,654,000 in 1914—an increase, "on the face of the returns," of 150 per cent—the thoughtful reader will wonder just how much the 1919 figure should be discounted to take care of the increased unit values placed on the pig iron produced. In a similar way, skepticism is aroused by the announcement of a gain of 206 per cent in the products of steel works and rolling mills—reported to have increased from \$918,665,000 in 1914 to \$2,812,775,000 in 1919.

By using a measuring stick in the shape of an average price of the product in each year under review, one may readily determine a quantitative ratio between the two years. Unfortunately, however, while this method is satisfactory in comparing similar products, it is of less assistance when the materials are essentially dissimilar—as wheat and steel and petroleum—unless we accept, for the time, at least, the theory that prices of 1914 form a basis to which we must return, or, per contra, that they were unduly low, and 1919 prices should be our future guide. But the latter have already been discounted, after first having been far outrun in 1920, and in a market yet without bottom one hesitates to apply even the prices current, knowing that a few months, at most, will probably render them in turn obsolete.

It happens that a composite price of rolled steel products in 1914, based on THE IRON AGE'S quotations, showed an average of \$28.39 per ton, compared with a 1919 average of \$63.24 per ton (2000 lb.). Similarly, a pig iron composite for 1914 was \$13.88, while \$29.37 was the corresponding figure for 1919. If we may assume that all the products reported by the Census Bureau under the two headings quoted varied in price, on the weighted average, in the same ratio as the two composite figures just mentioned, the figures of production as measured in 1914 dollars (or 1914 prices) appear as follow:

	1914	1919	Increase, Per Cent
Blast furnace products..	\$317,654,000	\$374,376,000	17.9
Steel works and rolling mills	\$918,665,000	1,262,724,000	37.4

These percentages of increase are quite different from the 150 and 206 per cent, respectively, figured on the reported values. But they appear to

be a fair measure of the absolute advance of the industry in quantity of production, regardless of all theories as to the permanency of any stipulated price level, and as such may be made the basis of similar comparisons when subsequent census figures tell of the progress made between 1919 and 1924.

Though 1914 and 1919 were both poor years in respect to production (1914 gave a rolled steel tonnage 18.5 per cent below the average of 1909 to 1913, inclusive, while 1919 was 17 per cent under the average of 1914 to 1918, inclusive) and hence it is unfortunate that they happened to fit into the Census Bureau's quinquennial schedule of statistics gathered. Nevertheless, they furnish, in their figures of production, definite confirmation of the analysis above given. Thus, the pig iron produced for sale in 1919 (8,690,227 tons) was 18.0 per cent above the 7,362,980 tons of 1914; and the steel rolled in 1919 (25,101,544 tons) was 36.7 per cent greater than the 18,370,196 tons of 1914.

The slump in international iron and steel demand is emphasized by the export statistics for April, those for the United States appearing in THE IRON AGE last week and the British data elsewhere in this issue. For the first time American and British iron and steel exports were practically on a parity in April, at 162,592 and 161,508 gross tons, respectively. With the coal strike on, the British movement in April was larger than was to be expected and exceeded that for March, but it was less than 40 per cent of the pre-war or 1913 record. The extent of the British decline is measured by the fact that the British exports to May 1, this year, were only 177,906 tons per month, which is less than the 1919 average of 188,519 tons per month. A different contrast is presented by the import figures. The British receipts in April were 111,535 tons, making this year's average 117,414 tons per month to May 1, as against imports of 195,200 tons per month in 1913. The interesting point is that while British imports continue high and exports are less than 40 per cent of the pre-war records, American exports are even now 67.5 per cent of the 1913 rate. In both cases, however, capacity, particularly American, has been increased greatly and a heavier export demand is necessary to a healthy and profitable operation of the industry of both countries. •

Bids on Sheet Steel

WASHINGTON, June 7.—Max Solomon, a Pittsburgh scrap dealer, with an average price of \$10.58, submitted the highest bid to the War Department for 20,000 gross tons of shell steel and forgings, located at points in the East and Middle West. The next highest bidder for the entire tonnage was the Hyman-Michaels Co., Chicago, at an average price of \$8.99, while the Jones & Laughlin Steel Co., Pittsburgh, whose figure was \$8.54, came next. The highest bid for any single lot was \$12.15, submitted by Mr. Solomon.

Iron and Steel Institute in France

The autumn meeting of the Iron and Steel Institute will be held, by invitation of the Comité des Forges de France, in Paris on Monday and Tuesday, Sept. 5 and 6, 1921. Following the meeting alternative visits have been arranged to works in Lorraine and in Normandy. A party of the members have been invited also to visit the Creusot works of Schneider & Co.

REORGANIZATION PLANS

Secretary Hoover Making Effective His Ideas as to Co-operating with Industries

WASHINGTON, June 6.—Definite plans for a practical reorganization of the Bureau of Foreign and Domestic Commerce, to meet the existing commercial situation and problems involved in foreign trade, have already been made by Secretary of Commerce Hoover, as the result of the passage by Congress of the second deficiency bill carrying an appropriation of \$250,000 for this work. Mr. Hoover announced yesterday that of the industrial groups that are to be organized, those relating to textiles, chemicals, coal, oil, leather products and food stuffs have been positively settled upon. The setting up of other groups is a question as to what they shall include in the way of their composition and their possibilities. Among these groups will be one relating to machinery, and if a steel group as such is not established, this industry will receive co-operation through one of a number of service committees that have been and are to be named. Another group will deal with specialties such as labor-saving devices, including typewriters.

Industrial Groups

Originally, it was the intention of Secretary Hoover to create 12 industrial groups, but it has not been definitely determined as to the number that will be set up, and no specific provision of this kind is made by Congress.

These groups will carry out the same parallel groupings that apply to the Bureau of Standards and the Bureau of the Census. The Bureau of Standards also was given \$250,000 of the appropriation of \$1,000,000 for the Bureau of the Census, for the continuation of investigation of structural materials for which \$50,000 is allowed; for technical investigations in co-operation with industries upon fundamental problems involved in industrial development following the war, with a view to assisting in permanent establishment of the new industries developed during the war, including personal services of the District of Columbia and elsewhere, for which \$100,000 was allowed, and for co-operation of the Bureau of Standards with Government departments, engineers and manufacturers, with regard to standardization and testing of instruments, equipment, tools, etc., for which \$100,000 was allowed.

Four Groups

Groups under the Bureau of Foreign and Domestic Commerce, which is allowed two additional assistant directors, making four in all, will consist of the heads of divisions and assistants who will co-operate with service committees selected from the various industries. It is proposed to have two expert men for each group. The underlying plan is that with the Bureau of Foreign and Domestic Commerce and the Consular Service of the State Department acting as an agency for recruiting foreign commercial information, there shall be a link to bring the service into direct connection with the industries of the country for the promotion and development of foreign commerce. These divisions are to direct the foreign service so as to secure results needed by the industries themselves. At the same time, the industries are to distribute this preparation among these groups. The experts will make special investigations into particular trade conditions abroad requiring special skill. Detail plans that Mr. Hoover has in mind were set forth in THE IRON AGE of May 26.

Service Committees

Briefly, it is recognized that it is necessary to have experts in the respective trades in co-operation with the service committees on the industries, to assist the bureau in guiding the foreign service to particular results and to give encouragement to the industries to push ahead. Information involving vital facts of value to the industries would be collected, adequately prepared and distributed, and intended to show the direc-

tions in which commerce may be extended to the best advantage. Secretary Hoover has pointed out that the world is facing an entirely new era in foreign trade, and due to the economic conditions abroad, there is a growing tendency to consolidate for militant export purposes in practically every country in Europe. He spoke both of the consolidation of industrial concerns by mergers of capital and of the direct combination of exporters for unity in the exploitation of foreign markets. If these combinations are met, he holds that it is necessary to secure more collective action on the part of the American industries and that it is at least necessary to furnish special information upon which America can act and that such information must be secured under expert direction.

Another factor in foreign commerce requiring a great deal of study is foreign combinations for imports. This results in the whole buying for a nation of a given commodity, so that these combinations may more or less dictate prices within the United States. Consequently, it is maintained that it is necessary to have a general staff of specialists to work out, in co-operation with American industries, policies and methods to meet these forces.

Addressing an informal gathering of business men in Franklin, Pa., on June 3, Charles M. Schwab, chairman Bethlehem Steel Corporation, said he would not want to see an immediate return of prosperity in America. "If we were to recover quickly from our depression," he said, "we should find ourselves back in a period of abnormal times such as we have just passed through." Mr. Schwab's visit to Franklin was in connection with an inspection of the new plant there of the Chicago Pneumatic Tool Co.

The Interstate Iron & Steel Co. turned over its new continuous merchant mill at South Chicago on June 5. The mill contains six stands of 16-in. roughing, two 14-in. finishing stands and four 12-in. finishing stands. Running full the mill will roll 75,000 tons per year.

The Iron Age and Its Readers

In spite of the suddenness with which to many in business came the flood of cancellations and the collapse of buying in the fall of 1920, it remains true that a careful reading—not a mere perusal—of THE IRON AGE market summaries must have brought hints to the wary—hints to which many were not receptive, such was their confidence that the pace was good for another year or two. Some letters from our readers in the first half of the year showed how doubts were being raised that demand could long keep on at the then high rate. Some of the straws showing some movements to the surface trend were the following:

On Jan. 22, 1920, was noted a sharp drop in export buying; on Feb. 19 was emphasized the caution being shown in financial circles and the suspension of some steel shipments; on Feb. 26 was reported the hesitation of one group of buyers; on March 25 was published a hint that some of the leaders in the trade expected an easing of premium prices in the second quarter of the year and that some ship material cancellations had occurred; on April 1, a series of predictions was made of easier conditions, followed by still others in the week of April 8. Then came the railroad strike, which clouded the issue, but on May 6 came the suggestion that mills would shortly be able to take care of the proffered business, particularly with the diminution in shipbuilding and tank construction; and then on June 3 were recorded the first reports of automobile plant cancellations or suspensions at a time when the slowing up of automobile manufacture was generally not believed.

IRON OUTPUT STILL LOW

May Production at About Same Rate as in April

Net Loss of Six Furnaces—Manganese Alloy Output Lowest in 20 Years

The rapid decline which has characterized the country's blast furnace output in recent months appears to have ceased with the May production which, while at a slightly less daily rate than that in April, is a little larger as to total than the previous month. The increase in the May total over April was 28,180 tons, with a decrease in daily rate of 374 tons per day. The production, however, is at a very low rate, the next lowest on record having been in July, 1908, when the total was 1,218,129, as compared with 1,221,221 last month. The net loss in furnaces blown out or banked in May was six or the same as in April, which makes the net loss in the last eight months 229 furnaces.

The production of coke and anthracite furnaces in May, a 31-day month, amounted to 1,221,221 gross tons, or 39,394 tons per day, as compared with 1,193,041 tons, or an average of 39,768 tons per day in April, a 30-day month, and with 1,595,522 tons, or 51,468 tons per day in March, a 31-day month. In May, 1920, the total output was 2,985,682 tons, or 96,312 tons per day. The total furnaces in blast on June 1 was 90, compared with 96 on May 1, with 102 on April 1 and 201 on Jan. 1. The 90 in blast June 1 had a capacity of 38,080 tons per day, as compared with 38,505 tons per day for the 96 in blast on May 1 last. There were 13 furnaces blown out or banked and seven blown in during May.

A feature of the May output was the rapid decline in production of ferromanganese and spiegeleisen, the total of 9232 tons being the lowest since before the war. In January, 1911, the total output of these two alloys was 8360 tons, which marks the lowest previous record. Of the May output, this year, 6853 tons was ferromanganese. This contrasts with an output in April this year of 9466 tons of ferromanganese and with a total for the two alloys of 24,310 tons.

Daily Rate of Production

The daily rate of production of coke and anthracite pig iron by months, from May, 1920, is as follows:

Daily Rate of Pig Iron Production by Months—Gross Tons			
1920	Steel Works	Merchant	Total
May	68,668	27,644	96,312
June	73,659	27,792	101,451
July	71,954	26,983	98,937
August	72,740	28,789	101,529
September	74,908	29,402	104,310
October	77,214	28,998	106,212
November	71,669	26,161	97,830
December	66,037	20,185	86,222
January, 1921	62,327	15,618	77,945
February	58,060	11,127	69,187
March	42,691	8,777	51,468
April	33,854	5,911	39,768
May	33,054	6,340	39,394

The figures for daily average production, beginning with January, 1915, are as follows:

Daily Average Production of Coke and Anthracite Pig Iron in the United States by Months Since Jan. 1, 1915—Gross Tons									
	1915	1916	1917	1918	1919	1920	1921		
Jan.	51,859	102,746	101,643	77,799	106,525	97,264	77,945		
Feb.	59,813	106,466	94,473	82,835	105,006	102,720	69,187		
Mar.	66,575	107,667	104,882	103,648	99,685	108,900	51,468		
Apr.	70,550	107,592	111,165	100,607	82,607	91,327	39,768		
May	73,015	108,422	110,238	111,175	68,002	96,312	39,394		
June	79,361	107,053	109,002	110,793	70,495	101,451			
July	82,691	104,017	107,820	110,354	78,340	98,931

Oct.	100,822	113,189	106,550	112,482	60,115	106,212			
Nov.	101,244	110,394	106,859	111,802	79,745	97,830			
Dec.	103,333	102,537	92,997	110,762	84,944	87,222			

Production of Steel Companies—Gross Tons

Returns from all furnaces of the United States Steel Corporation and the various independent steel companies, as well as from merchant furnaces producing ferromanganese and spiegeleisen, show the following totals of steel making iron, month by month, together with ferromanganese and spiegeleisen. These last, while stated separately, are also included in the columns of "total production."

Production of Steel Companies—Gross Tons

	Total Production			Spiegeleisen and Ferromanganese		
	1919	1920	1921	1919	1920	1921
Jan.	2,430,022	2,331,117	1,932,159	32,787	23,957	22,228
Feb.	2,209,470	2,137,670	1,625,095	28,105	28,038	29,013
Mar.	2,277,507	2,306,678	1,323,443	26,644	35,275	41,294
Apr.	1,838,677	1,978,322	1,015,621	17,308	27,628	24,310
May	1,586,800	1,128,770	1,024,678	14,604	33,407	9,282
June	1,675,944	2,209,170		14,254	34,751	
July	1,906,604	2,230,677		14,805	36,789	
Aug.	2,108,563	2,311,948		17,419	36,985	
Sept.	1,828,613	2,217,210		20,631	39,546	
Oct.	1,295,690	2,303,644		20,238	34,786	
Nov.	1,727,656	2,150,075		19,964	26,944	
Dec.	1,916,249	2,047,167		15,718	28,023	

Capacities in Blast June 1

The following table shows the number of furnaces in blast June 1 in the different districts and their capacity, also the number and daily capacity in gross tons of furnaces in blast May 1:

Coke and Anthracite Furnaces in Blast					
Location of Furnaces	Total Stacks	June 1		May 1

Diagram of Pig Iron Production and Prices

The fluctuations in pig iron production from 1913 to the present time are shown in the accompanying chart. The figures represented by the heavy line are those of daily average production by months of coke and anthracite iron. The dotted curve on the chart represents monthly average prices of Southern No. 2 foundry pig iron at Cincinnati, local No. 2 foundry iron at furnace at Chicago, and No. 2X at Philadelphia. They are based on the weekly quotations of THE IRON AGE.

The Full Line Represents the Daily Production of Pig Iron and the Dotted Line Is the Average of the Price Per Ton of No. 2 Southern Pig Iron at Cincinnati, Local No. 2 Iron at Chicago and No. 2X Iron at Philadelphia

Production of Coke and Anthracite Pig Iron in the United States by Months, Beginning Jan. 1, 1917—Gross Tons

	1917	1918	1919	1920	1921
Jan.	3,150,938	2,411,768	3,302,260	3,015,181	2,416,292

Oct.	3,303,038	3,486,941	1,863,558	3,292,597
Nov.	3,205,794	3,354,074	2,392,350	2,934,908
Dec.	2,862,918	3,433,617	2,633,268	2,703,855

Total, yr. 38,185,981 38,506,047 30,582,878 36,414,114

*These totals do not include charcoal pig iron. The 1919 production of this iron was 327,097 tons.

Among the furnaces blown in during May are the following:

The Princess furnace in Virginia; United furnace in central Ohio; Jisco furnace in southern Ohio; No. 1 and No. 4 Joliet furnaces of the Illinois Steel Co. in Illinois; one furnace of the Minnesota Steel Co. in Minnesota and the Alabama City furnace of the Gulf States Steel Co. in Alabama.

Among the furnaces blown out or banked during May were the following:

One Bethlehem furnace in the Lehigh Valley; Nos. 1 and 3 Isabella furnaces of the Carnegie Steel Co. and one Monongahela furnace of the National Tube Co. in the Pitts-

burgh district; Saxton furnace in western Pennsylvania; two furnaces of the Virginia Iron, Coal & Coke Co. in Virginia; Grace furnaces of the Brier Hill Steel Co. and the Cherry Valley furnace in the Mahoning Valley; No. 4 furnace of the National Tube Co. in northern Ohio, Nos. 1 and 2 Gary furnaces of the Indiana Steel Co. in Indiana and one Bessemer furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama.

Bids on Steel Tanks

WASHINGTON, June 7.—The Pittsburgh-Des Moines Steel Co. appears to have been the lowest bidder for supplying the Emergency Fleet Corporation with 14, 55,000-bbl. steel tanks. This company submitted a bid of \$10,985 for each tank when using its own material and \$8,377.90 if it is to do the work of fabricating only and the material supplied by the Fleet Corporation. Each tank is to be 144 ft. 7 in. by 30 ft. 4 in. and involves approximately 200 tons of plates. Prices quoted are on an f.o.b. basis at manufacturers' plants. Among other quotations were the following, the first set of figures calling for the supplying of steel by the fabricators and the second by the Fleet corporation: American Bridge Co., \$11,464.30; \$10,341.42; Ritter-Conley Co., Pittsburgh, \$11,780; \$9,740; Pressed Steel Car Co., Pittsburgh, \$12,567; \$11,569; Petroleum Iron Works Co., Sharon, Pa., \$11,700; \$8,985; Reeves Bros. Co., Alliance, O., \$12,500; \$10,072; Youngstown Boiler & Tank Co., Youngstown, O., \$11,928; \$11,025.

Iron and Steel Markets

DRAGGING BOTTOM

May Iron and Steel Output Close to April Level

Lower Wire, Sheet and Pig Iron Prices—Concessions in Other Lines

The statistics of both pig iron and steel ingot production in May bear out the estimate generally accepted in that month that steel works were averaging a 30 per cent operation. In both cases the figures are so close to those for April as to suggest an industry fairly dragging on the bottom, with little in sight pointing to any appreciable change.

In the 31 days of May pig iron production was 1,221,221 tons, or 39,394 tons per day, against 1,193,041 tons in the 30 days of April, or 39,768 tons per day. For a smaller output in a 31-day month nearly 13 years must be retraced, July, 1908, showing 1,218,129 tons.

Thirteen furnaces were blown out in May and seven were blown in—a net loss of six. The 90 furnaces active as June came in had a daily capacity of 38,080 tons per day against 38,505 tons for 96 furnaces on May 1. Current production is at a yearly rate of 14,000,000 tons, whereas output in 1920 was 36,925,987 tons.

The American Iron and Steel Institute's steel statistics, just issued, show that the May output of ingots was 1,503,206 tons, or about 4 per cent more than April, with 1,441,537 tons. At the May daily rate annual production would be 17,980,465 tons. Output in both 1917 and 1918 exceeded 43,000,000 tons.

The volume of current business has if anything fallen off in the week. Definitely lower prices have been established in wire products, and in black and blue annealed sheets. Concessions are made in other finished steel lines, but owing to paucity of the orders price shading is not general.

Plain wire is now quoted at \$2.75 per 100 lb., wire nails at \$3 per keg and galvanized barbed wire at \$3.85 per 100 lb., all \$5 a ton below prices recently obtaining, and even some shading of the \$3 nail price is reported. Black sheets are down \$3 a ton to 3.85c., Pittsburgh, and blue annealed, \$4 a ton, to 2.90c. On two carloads of plates, less than 2c. a pound, Pittsburgh, was named and in Indianapolis 500 tons of steel bars were sold at 2c. On 400 tons of hard steel bars for the Government at Norfolk, the low price was 1.85c.

The largest transaction of the week in pig iron is the purchase of 25,000 tons of foundry grades by a cast iron pipe company at a price several dollars lower than \$22, Birmingham, which has been the prevailing quotation. Basic, Bessemer and malleable iron have declined \$1 and foundry grades 50c. to \$1 in the Pittsburgh district, and similar reductions in foundry irons are reported in other centers, while nominal advances in eastern Pennsylvania have not been followed by sales. Basic has sold at Chicago at \$20, local furnace.

One reassuring development is that jobbers serving the farmers are buying more freely than those dependent on the manufacturing trade, particularly in the Northwest, where the improved wheat market is having its effect.

General highway bridge and other construction promises still to absorb large quantities of structural steel but especially concrete reinforcing bars. A stadium for Ohio State University will require 4500 tons of steel and a Masonic Temple at Detroit, 7000 tons. The larger fabricated steel awards of the week total 7000 tons.

Business on railroad account includes the purchase of 500 tons of rails for the Cleveland electric railroad system, the awarding of repairs of 500 cars of the Soo Line and the ordering of 500 refrigerator cars for the Great Northern, although most of the steel needed in the last case is already in the possession of the car builder.

Track bolts and spike prices are unsteady. Quotations as low as 3c. and 3.10c., Pittsburgh, are reported on spikes and 3.62c. on bolts.

The ferromanganese and spiegeleisen output in May fell to the lowest in 20 years or 9232 tons as compared with 8360 tons in January, 1911.

For export, inquiries originate principally in the Far East and are chiefly for railroad equipment, among which are nine steel bridges for Japan and cars and locomotives for Chinese roads. About 500 tons of large diameter steel pipe is wanted for Formosa.

Pittsburgh

PITTSBURGH, June 7.

While there is no doubt in the minds of the iron and steel trade here that consumption exceeds production, no very definite idea yet has been formulated as to how long the industry must withstand the present stagnation of business for the reason that there are no reliable statistics as to the stocks in second and third hands and, without this information, it is impossible to accurately forecast when necessity will compel more liberal purchases. A water works engineer can readily estimate how long it will take to empty a reservoir when the inflow and outflow are known and, based on production and consumption, it might be possible to set a time when the iron and steel business would recover. The difficulty now is that iron and steel reserves are an unknown quantity.

Business has not improved in the past week; on the contrary, the more common report is that it has declined further. Buyers hold fast to the belief that lower prices are ahead and are suiting their purchases to this idea. The week has developed definitely lower prices in wire products and in black and blue annealed sheets. The downward movement is neither pronounced nor general, as there are several manufacturers who are disposed to shut down their plants rather than actively compete for a share of the small business that is being offered. The decline in wire products has once more proven the fact that price reductions at this time are not an effective means of stimulating business.

Pig iron prices have suffered further recessions running from 50c. to \$1 a ton and curtailment of steel works operations finds reflection in a similar decline in prices of scrap iron and steel.

Although coke production is at the lowest point

in years, still lower prices have been reached in the past week. New prices show operators substantial losses, but business is accepted at these prices because even greater losses would be sustained by complete suspension of the mines and ovens.

Pig Iron.—The only important business recently done has been the purchase by an Allegheny Valley sheet maker of approximately 2000 tons of basic iron at delivered prices of \$22.25 to \$22.50. The iron was sold by middlemen and while definite details are withheld, it is the common impression that the iron will not come from any of the Valley furnaces. Deducting the freight from the Valley of \$1.96 per ton would mean about \$20.25 to \$20.50, furnace, if the iron were coming from the Valley. One lot of 500 tons of basic iron recently was sold at \$21, Valley furnace, and this now measures the market on this grade, especially in view of the fact that merchant producers have expressed a willingness to take business at that figure. Bessemer iron has been sold at \$23, Valley furnace, in small lots and that price represents the present maximum possibilities with regard to prices. Malleable iron has been offered at \$23, Valley furnace, and possibly could be bought for less. The market on No. 2 foundry iron is quotable from \$22.50 to \$23, but the latter is more of an asking than a selling price. The American Radiator Co. is reported to have bought considerable foundry iron for its several plants around \$21 from lake furnaces. Average prices of pig iron from Valley furnaces for the month of May as compiled by W. P. Snyder & Co. show that basic brought \$21.87½ or 62.5c. below the April average and Bessemer \$24.25, a decline of 75c. from April average. The Standard Sanitary Mfg. Co. recently bought 200 tons No. 2 foundry for its Louisville plant at \$22,

Birmingham, this price being quoted by all makers in that district.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$21.00
Bessemer	23.00
Gray forge	\$21.50 to 22.00
No. 2 foundry	22.50 to 23.00
No. 3 foundry	22.00 to 22.50
Malleable	23.00

Billets, Sheet Bars and Slabs.—Few now active in the business can recall a time when demand was at such a low ebb. Prices established April 13 find fairly close observance, but it would be exaggeration to call the market firm in the absence of inquiries which would provide a test. Demand is held on check, not only the slow demand for finished products, but because supplies of billets, sheet bars and slabs are ample and buyers see no reason to expect higher prices.

We quote 4 x 4-in. soft Bessemer and open hearth billets at \$37, 2 x 2-in. billets, \$39; Bessemer and open-hearth sheet bars, \$39; slabs, \$38; forging billets, ordinary carbons, \$42, all f.o.b. Youngstown or Pittsburgh mills.

Ferroalloys.—The market here is dull, unsettled and weak. The largest inquiry now on the market is for 5 tons of spiegeleisen for third quarter delivery from a steel maker outside the Pittsburgh district, and it is probable that the prospective buyer will decide eventually to buy by the month, instead of placing his tonnage at one time. Makers still ask up to \$35, furnace, for average 20 per cent material, but no recent business has been done at higher than \$32 and a firm bid of \$30 hardly would go begging. Domestic ferromanganese now is quotable at \$75 to \$80, delivered, these prices representing a fair appraisal of to-day's possibilities rather than sizable sales. Only carload lots are mov-

ing and even such sales are anything but numerous. English material still is held at \$75 c.i.f. Atlantic seaboard, but this would mean a delivered price in this district above that of domestic material and, consequently, attracts no attention. The market for 50 per cent ferrosilicon is purely a buyers' affair. All makers are anxious for business and would go pretty low to secure an order. Canadian producers are said to have quoted under \$70 delivered, in an effort to uncover a demand.

We quote 76 to 80 per cent ferromanganese at \$75 to \$80 delivered on domestic, English, 76 to 80 per cent, \$75, c.i.f. Atlantic seaboard. We quote average 20 per cent spiegeleisen at \$30 to \$32 furnace quoted by makers on direct business and \$38 to \$30 furnace on resale tonnages, 50 per cent ferrosilicon, \$70 to \$75 furnace, freight allowed, for domestic and foreign material. Bessemer ferrosilicon is quoted f.o.b. Jackson County and New Straitsville, Ohio, furnaces, as follows: 9 per cent, \$41.50; 10 per cent, \$45; 11 per cent, \$48.50; 12 per cent, \$51.60. Silvery iron, 6 per cent, \$32; 7 per cent, \$33.50; 8 per cent, \$35.50; 9 per cent, \$37.50; 10 per cent, \$40; 11 per cent, \$43.20; 12 per cent, \$46.60. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Wire Rods.—Decline in prices of wire products has restricted an already small demand for rods, as the failure of the latter to drop with the finished products has encouraged some buyers to hold up shipping instructions against orders in. All makers are holding to \$48, Pittsburgh, for the base size of soft rods, but the market looks top-heavy. Prices are given on page 1582.

Iron and Steel Bars.—Demand for mild steel bars still is entirely for small lots for prompt shipment and because of the character of the buying there have been no important deviations from the regular market price of 2.10c. base. Some makers, rather than go to the expense of starting up idle mills for brief periods, are turning down orders which they cannot supply from stock. Inquiries for reinforcing bars are fairly numerous although generally for small lots. Such bars, rolled from new billets are held at 2.10c. base, but prices as low as 1.80c., presumably against bars rolled from old rails, shell steel or billet crops, are reported. The contract for the Baldwin reservoir in Cleveland, which will take about 1700 tons of reinforcing bars, has been awarded a Cleveland contracting company, which has not yet placed the business. Iron bars still are slow of sale and attractive orders undoubtedly would develop lower prices.

We quote steel bars rolled from billets at 2.10c., reinforcing bars, rolled from billets, 2.10c. base, reinforcing bars rolled from old rails, 1.90c. to 2c., refined iron bars, 2.75c., in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—At least two good sized structural projects have been placed with fabricators in this district in the past week. The Jones & Laughlin Steel Co. has taken 1300 tons for a crusher plant for the Kelley Island Line & Transport Co., Marblehead, Ohio, and the Pittsburgh Des Moines Steel Co. has taken 1200 tons for a Navy Department aviation station, Ford Island, Hawaii. Other awards have been for small tonnages and although fairly numerous, do not reach any very large aggregate. Disputes between the contractors and building trades exist in practically all of the large cities in the country and Pittsburgh is no exception. The men are refusing to accept a cut in wages proposed in the new scale offered by contractors. An effort is being made in some centers to establish the open shop, but in this district the movement has been unsuccessful because of the failure of contractors to stand together. An award is expected soon of the 14 55,000-barrel tanks recently put up by the Shipping Board. Plain material is inactive and prices nominal. Prices given on page 1582.

Plates.—There is no change in the market as regards either the demand or prices. Inquiries run entirely to small tonnages for immediate shipment and on such business makers are not disposed to cut prices. Sizable tonnages, however, will undoubtedly develop lower prices. We quote sheared plates of tank quality, ½-in. and heavier, at 2.20c., base Pittsburgh.

Steel Rails.—Very fair demand still is observed for light rails from the coal operators, but contractors and other users still are buying very sparingly. These rails rolled from new steel are generally held at 2.20c., Pittsburgh, but those rolled from old standard sections

are offered at 2c. and on firm offers could be bought as low as 1.90c.

We quote 25 to 45-lb. sections, rolled from new steel, 2.20c.; rolled from old rails, 1.90c. to 2c.; standard rails, \$45 mill for Bessemer, and \$47 for open-hearth sections.

Hoops and Bands.—Business continues extremely slow, with buyers taking hold entirely in a hand to mouth way. Such business as is coming out is for immediate shipment and is being met largely from manufacturers' stocks. The price remains at 2.75c. base, but strict observance of this quotation is not claimed.

Cotton Ties.—Announcement of opening prices will be much later this year than usual, as makers seem inclined to wait until a demand appears before making a quotation. A good many ties were carried over from last year and early requirements will be supplied from these stocks.

Nuts, Bolts and Rivets.—There is no improvement in business, buyers still showing a tendency to confine purchases strictly to actual needs. Recent prices, however, are fairly well maintained because manufacturers are not trying to stimulate demand at the expense of profits. Rivets still are weak, however. Some makers who want orders have recently quoted as low as \$3.10. Prices and discounts are given on page 1582.

Iron and Steel Pipe.—Purchases steadily are dwindling and while plant operations do not reflect this fact, this is because makers are producing for stock. Manufacturers are finding considerable competition in oil country pipe from offerings by speculators and also because several of the oil companies are offering their surplus stocks in the expectation of being able to replace them when needed at less than to-day's prices. Demand for merchant pipe is better than that for oil country goods but at that the jobbers are ordering cautiously. Open shading of prices is absent, but this must be ascribed chiefly to the belief held by manufacturers that price cuts at this time would not help business. Discounts are given on page 1582.

Steel Skelp.—Inquiries are few and for small lots, and few of such sales as are being made bring the full quotation of 2.20c., Pittsburgh. Makers here who have quoted that price invariably have lost the order.

Wire Products.—The recent reduction of \$5 per ton in quotations by independents, which unofficially is being met by the American Steel & Wire Co., has failed utterly to stimulate the demand, which has been even lighter in the past week than it was previously. Indeed, some makers observe a tendency on the part of buyers to withhold shipping instructions against orders already in. Persistent reports of further reductions are making buyers extremely cautious.

We quote wire nails at \$3 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.75 base per 100 lb. Pittsburgh.

Cold-Finished Steel Bags.—It is doubtful whether this branch of the industry ever before experienced a period when demands were so few and small. Consumers still have sizable stocks and are more interested at the moment in reducing, than in adding to, them. Most makers still ask 2.10c., base, but 3c. has been done and difficulty now is being experienced by makers to get more.

Hot-Rolled and Cold-Rolled Strips.—Reports about business vary somewhat, some noting a moderate increase in orders, while others still find interest on the part of consumers extremely small. One Pittsburgh district company has accumulated enough orders to run two mills this week, but it is noted that the company which secured much of the Ford business of a few weeks ago has its strip mills down this week. In general, there is room for considerable improvement in business. Prices are not very well defined. The stabilized bases were 2.75c. for hot-rolled and 5.50c. for cold-rolled, but these prices have been hard to obtain since the Ford Motor Co. was able to buy so much lower.

Spikes.—Fair demand is noted for small spikes in connection with coal mine development work, but sales are neither numerous nor large. Railroad spikes are dull and improvement is not expected until after the railroads have the advantage of lower wage costs and start laying rails. Large makers are quoting 3.40c.,

base, Pittsburgh, on all sizes, but on large spikes this price is being shaded by at least \$3 per ton, and the Colorado Fuel & Iron Co., which is the low bidder against the 13,000 kegs asked for by the Southern Pacific Railroad, is said to have named a price of \$3.50, f.o.b. Pueblo. Prices are given on page 1582.

Chain.—Effective June 1, leading makers revised downward on a number of kinds of chain. The new prices show reductions of 20c. to 40c. per pair on trace chains, with the extras for hooks, T hooks and T bars cut 2c. per pair from the old list, dated April 11, 1921, while the charge for galvanizing and for copper plating has been cut from 2c. to 8c. per pair. Stake chains have been lowered 25c. to 30c. per ft. Discounts have been increased (price lowered) 5 per cent on butt, stage, breast, with the exception of double and tapered, machine and coil chains and cow ties. Repair links and lap links and rings have been reduced in price 15 per cent. No. 25 steel dees now are quoted at list, against list plus 20 per cent in the April list.

Sheets.—It is impossible to chronicle any material betterment in business, although some fair-sized orders recently have been coming in from Japan. The past week has developed some deviation by independent makers from the stabilized prices of April 13. Business in blue annealed sheets has been booked as low as 2.90c., base, and sales of black sheets have been done as low as 3.85c., base, concessions from the regular market quotations of \$4 and \$3 per ton respectively. Prices are given on page 1582.

Tin Plate.—Makers of cans for the condensed milk trade are specifying fairly freely, but demands from other sources still are few and small. Production plate still is quoted at \$6.25 per base box, Pittsburgh, and this is the base of shipments against contracts. New orders carrying that price, however, are few and small, as container manufacturers are meeting extra demands to a large extent from stock items, which are available anywhere from \$5 to \$5.75.

Coke and Coal.—The coke market has developed fresh weakness in the past week and \$3.50 per net ton oven has given place to \$3.25 as the maximum on standard furnace fuel, either for spot or future shipment. As a matter of fact, \$3.25 has not found much basis in recent transactions, as the largest piece of business done was 9000 tons for June shipment to a merchant furnace which has about enough business to keep in blast this month, and the price was \$3.15. At least one producer quoted \$3 against this business, which was placed at a higher price to the producer already supplying this furnace. An Eastern steel company, which is piecing out its contract shipments by spot tonnages has been able lately to pick up choice brands of furnace coke at \$3. The market is quotable from \$3 to \$3.25 per net ton oven. It develops that the Robeson business was taken at around \$3.60 per net ton, ovens, the contract to run to Oct. 1, and calling for 8000 tons a month. The Thomas Iron Co., Hokendauqua, Pa., has inquired for 4000 tons a month for last half shipment, the Colonial Iron Co., Riddlesburg, Pa., for 7000 tons a month and the Empire Steel & Iron Co., Catasauqua, Pa., for 500 tons a month. None of these inquiries has been closed, though as low as \$3.25 has been quoted against them. Foundry coke also is weaker, in that \$5 per net ton, ovens, now is the top quotation, while good brands can be bought at \$4.50 to \$4.75 and as low as \$4 and \$4.25 is heard of on unselected 72-hour fuel. Present furnace coke prices show producers a considerable loss, but coal is not in demand and there are some operators whose loss would be greater if they were to shut down. Lake shipments have not benefited the coal market, which still is in buyers' favor. Spot offerings of mine run steam coal still can be had at \$1.75 to \$2, while not much more is obtainable on by-product coal and while high grade gas coal is fetching as much as \$2.50, the more common range is from \$2 to \$2.25.

Old Material.—Prices have weakened perceptibly since a week ago, due to a further falling away in the demand in keeping with steel works operations. Plants which are in operation appear to be congested and permits for shipments to them are being withheld. Shipping instructions are lacking to those plants which are

down or nearly so. This condition has resulted in price cuts of from 50c. to \$1 per ton in almost all grades. One steel maker here recently was offered 1000 tons of heavy melting steel at \$13 delivered, but being filled up for the present turned down the offer. At that, the offerings of this and other grades are anything but heavy. Users of machine shop turnings have not been flooded with tonnages at the prices they are willing to pay. Steel makers here who made bids of around \$13.50 for the couplers, knuckles and springs in the June list of the Pennsylvania Railroad, Eastern region, failed to secure any of the material offered. Max Solomon, this city, was the successful bidder for the 22,000 tons of shell forgings, bids for which were opened by the Ordnance Salvage Board in Washington yesterday. The price was \$10.58 per gross ton, f.o.b. shipping point, which means from \$16 to \$16.50 delivered Pittsburgh district.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$13.00 to \$13.50
No. 1 cast cupola sizes.....	17.00 to 17.50
Revolving mills, Newark and Cambridge, O.; Cumberland, Md.; Huntington, W. Va.; Franklin, Pa. and Pittsburgh.....	14.50 to 15.00
Compressed sheet steel.....	10.50 to 11.00
Bundled sheet sides and ends, f.o.b. consumers' mills, Pittsburgh dist.....	8.50 to 9.00
Railroad knuckles and couplers.....	14.00 to 14.50
Railroad coil and leaf springs.....	14.00 to 14.50
Railroad grate bars.....	11.50 to 12.00
Low phosphorus melting stock, bloom and billet ends, heavy plates, 3/4-in. and heavier.....	17.50 to 18.00
Railroad malleable.....	12.00 to 13.00
Iron car axles.....	21.00 to 22.00
Locomotive axles, steel.....	18.00 to 19.00
Steel car axles.....	15.00 to 15.50
Cast iron car wheels.....	14.50 to 15.00
Rolled steel wheels.....	14.00 to 14.50
Machine shop turnings.....	8.25 to 8.50
Sheet bar crop ends at origin.....	14.00 to 15.00
Heavy steel axle turnings.....	10.50 to 11.00
Short shoveling turnings.....	9.50 to 10.00
Heavy breakable cast.....	14.50 to 15.00
Stove plate.....	12.50 to 13.00
Cast iron borings.....	9.00 to 9.50
No. 1 railroad wrought.....	12.50 to 13.00

May Steel Ingot Output Still Low

The steel ingot statistics of the American Iron and Steel Institute for May show that 30 companies, which in 1920 produced 84.21 per cent of the total, had an output last month of 1,265,850 gross tons, as compared with 1,213,958 tons in April. The increase for May was 51,892 tons, or about 4.10 per cent. Estimating the production of the other companies on the basis of those reporting, the total production of ingots in May was 1,503,206 tons, or 57,815 tons per operating day, counting 26 working days to the month, against an estimated total of 1,441,537 tons or 55,443 tons per operating day in April. This is an increase of 61,669 tons or 2372 tons per day. In the table below the output of Bessemer and open-hearth works is separated and the data for 1920 by months are included:

Monthly Production of Steel Ingots by 30 Companies Which Produced About 84.21 Per Cent of Total in 1920—(Gross Tons)

	Open Hearth	Bessemer	All Other	Total
January, 1920 ..	2,342,758	714,657	10,687	2,968,102
February ..	2,152,106	700,151	12,667	2,865,124

The May ingot production was at the yearly rate of 17,980,465 tons, counting 311 operating days to the year. This compares with a rate in April of 17,242,773 tons, and with a rate of 21,258,405 tons in March. The increase of 61,669 tons in the estimated ingot output of all companies in May over that of April compares with an increase of 28,180 tons in the May pig iron output over that of April, as given on other pages of this issue.

Chicago

CHICAGO, June 7.

The dearth of business is forcing a steady reduction in production by both mills and furnaces. The Illinois Steel Co. continues to operate 10 out of 29 blast furnaces in this district and is rolling steel at about 31 per cent of normal while the Inland Steel Co. at Indiana Harbor has two out of three blast furnaces running and is making steel at the rate of 25 per cent of capacity. Its Chicago Heights mill, however, is idle, as is the Calumet Steel Co. plant at the same place. The bar iron mills of the Republic Iron & Steel Co. and the Interstate Iron & Steel Co. at Chicago are also inactive. At South Chicago, however, the latter company is operating its open hearths, its billet mill and its recently completed continuous merchant mill on a 30 per cent basis. The Wisconsin Steel Co. mills are on a 20 per cent basis and one of its three blast furnaces is blowing. With the going out of a Federal stack, the number of merchant blast furnaces operating in this district has been reduced to two, one being at Mayville and the other an Iroquois furnace at South Chicago. The latter of late, has been making Bessemer iron for the Markpipe plant.

The market is weak in practically all departments, but owing to the paucity of orders, price shading cannot be said to be general. Here and there concessions are being made, however, and in some cases on unimportant tonnages.

On two carloads of plates, less than 2c. was named, and in the Kansas City district 1.90c., Pittsburgh, has been done. In Indianapolis 500 tons of steel bars was sold at 2c., Pittsburgh, and in the Northwest bar business has been taken at 1.90c. and 1.875c., Pittsburgh. The general reduction of \$5 a ton on wire and wire nails has not yet had any noticeable effect on business.

Jobbers serving the farmers are buying more freely than those dependent more largely on the manufacturing trade. This is particularly true in the Northwest, where the improved condition of the wheat market is having its effect. In fact, the large exports of wheat of late have aroused general interest. In some quarters hope is springing up for an earlier recovery of the agricultural implement industry than was heretofore thought possible.

Local steel producers are interested in an impending revision of transcontinental freight rates. The present rate on finished and semi-finished steel to the Pacific Coast is \$1.50 and the transcontinental lines have tentatively reduced it to \$1.05, which will apply from both Chicago and Atlantic tidewater points to the coast. This new rate has not yet been accepted by Eastern connecting lines and is not satisfactory to Western shippers, as the scheduled water rate from New York to the Coast is 75c., and considerably lower rates have been made on recent cargoes. Hearings are being held before the Transcontinental Freight Committee in this city this week, and it is possible that a further revision of all rail rates will be made.

Pig Iron.—A local furnace has sold 1000 tons of basic iron to a melter in the St. Louis district at \$20 base, Chicago. This quotation is not regarded as truly representative of the ruling market here, because it was taken in competition with furnaces near the buyer's plant from which the freight on the iron would have been negligible. Current business in Chicago and vicinity has been light and largely confined to carload lots. A Michigan melter bought 500 tons of malleable for June shipment at \$21.50, Chicago furnace, while a consumer in central Illinois purchased 300 tons of foundry for delivery within the next 45 days at \$20 base, Chicago. Locally buying will probably be stimulated somewhat as a result of the settlement of the strike of union molders. The strikers asked for 90c. an hour, while the foundries offered 85c. and a compromise was reached on the basis of 77.5c. an hour or \$7 a day. About 40 foundries are affected. The active Federal stack has been blown out with the result that only one merchant blast furnace, an Iroquois stack, remains in blast out of seven in this city. Local by-product foundry coke has been reduced 50c. a ton to \$11.25 delivered in the Chicago switching district. Connellsville foundry

coke is available at from \$5 to \$5.50 ovens, the freight to Chicago being \$4.62. At least one maker of Southern foundry iron is now quoting \$21 base Birmingham. One thousand tons of Southern resale, however, is being offered locally at considerably less than the delivered price of the furnace material.

The following quotations are for iron delivered at consumers' yards, except those for Northern foundry, malleable and steel-making irons, including low phosphorus, which are f.o.b. furnace and do not include a switching charge averaging 70c. per ton:

Lake Superior charcoal, averaging sil.	
1.50, delivered at Chicago.....	\$37.50
Northern coke, No. 1, sil. 2.25 to 2.75.....	\$22.00 to 22.50
Northern coke foundry, No. 2, sil.	
1.75 to 2.25.....	21.50 to 22.00
Northern high phosphorus.....	21.50 to 22.00
Southern foundry, sil. 1.75 to 2.25.....	27.67
Malleable, not over 2.25 sil.....	21.50 to 22.00
Basic.....	21.00 to 21.50
Low phosphorus, 0.040 furnace sil. 1 to 2	
per cent copper free.....	35.00
Low phosphorus, f.o.b. Birmingham, sil. 1 to 2	
per cent, copper free.....	31.00
Silvery, sil. 8 per cent.....	38.53

Ferroalloys.—Outside of an inquiry for 100 tons of spiegeleisen which has not yet resulted in an order, the market is without features.

We quote 78 to 82 per cent ferromanganese, \$80 delivered; 50 per cent ferrosilicon, \$80 delivered; spiegeleisen, 18 to 22 per cent, \$37 to \$38 delivered.

Plates.—The Great Northern Railroad has ordered 500 refrigerator cars from the General American Car Co. Not more than 1500 tons of steel will be needed in the construction of this equipment and the car builder has most of this material in stock. The Sinclair Refining Co. is asking for prices on the construction of four oil storage tanks of 55,000 barrels capacity each, for Tulsa, Okla. Only the tops of the tanks will be of steel, and they will require about 800 tons of light plates or heavy gage sheets. Demand for plates is unusually light, but such business as has been done has indicated the unsteady condition of the market. Two carloads, for example, were purchased for less than 2c., base Pittsburgh.

The mill quotation is 2c., Pittsburgh, the freight to Chicago being 38c. per 100 lb. Jobbers quote 3 23c. for plates out of stock.

Structural Material.—The situation remains substantially unchanged so far as fabricators are concerned. A fair number of small fabricating contracts have been awarded of late, but tonnage is far from the total necessary to put shops on a satisfactory footing. Locally the building trade lockout is still in effect and architects and contractors state that it is already too late in the year for new building projects to be undertaken even if an early settlement with the unions is reached. The largest fabricating prospect in the West is a Masonic Temple at Detroit which calls for about 7000 tons. Recent fabricating awards include:

Haukar at Pearl Harbor, Hawaiian Islands, 675 tons, to Pittsburgh-Jos Moines Steel Co.
Curtain Theater Building, San Francisco, 600 tons, to Judson Mfg. Co.
Laew Theater Building, San Francisco, 600 tons, to Judson Mfg. Co.
High school and junior college, Sacramento, Cal., 411 tons, to American Bridge Co.
Woodbury Junior High School, Denver, Colo., 323 tons, to Midwest Steel & Iron Works, Denver
Swift & Co. coal pulverizing plant, Fort Worth, Tex., 235 tons, to Gage Structural Steel Co.
Two highway spans, Oroville, Wash., 153 tons, reinforced concrete substituted for fabricated steel.

Pending work includes:

World Theater Building, Omaha, Neb., 350 tons, bids taken last week
Bascule bridge, Green Bay, Wis., 800 tons, plans to go out Aug. 1.

The mill quotation is 2.20c., Pittsburgh, which takes a freight rate of 38c. per 100 lb. for Chicago delivery. Jobbers quote 3 23c. for materials out of warehouse.

Rails and Track Supplies.—There is little demand for track accessories in this district, but it is apparent from purchases made in other sections that track bolts and spike prices are unsteady. Sales of spikes have been made at as low as 3.20c., Pittsburgh, while bolts have been sold at 4.20c., Pittsburgh. On the other hand, tie plates and angle bars appear to be firm. The Gary rail mill continues to operate at about 50 per cent of capacity.

Standard Bessemer rails, \$45; open-hearth rails, \$47; light rails rolled from new steel, 2.20c. f.o.b. makers' mills. Standard railroad spikes, 3.20c. to 3.40c., Pittsburgh; track bolts with square nuts, 4.20c. to 4.35c., Pittsburgh; steel tie plates, 2.50c., and steel angle bars, 2.75c., Pittsburgh and Chicago; tie plates, iron, 2.50c. to 3c. f.o.b. makers' mills.

Bolts and Nuts.—The market is very quiet and while prices are not firm, the paucity of sales makes it difficult to ascertain the ruling level of quotations. Jobbers have practically no stocks, but are afraid to buy because they expect another general reduction in steel prices which they believe would be reflected in bolt and nut discounts. Rivets are weak. A Western railroad bought 20 tons of large structural rivets at less than \$2.90, f.o.b. Pittsburgh, and as low as \$2.75 is also reported to have been done. For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 1582.

Jobbers quote structural rivets, 4.53c.; boiler rivets, 4.63c.; machine bolts up to $\frac{1}{2}$ x 4 in., 50 per cent off; larger sizes, 45 off; carriage bolts up to $\frac{1}{2}$ x 6 in., 40 off; larger sizes, 40 off; hot pressed nuts, square and hexagon tapped, \$2.10 off; blank nuts, \$2.60 off; coach or lag screws, gimlet points, square heads, 50 and 5 per cent off. Quantity extras are unchanged.

Railroad Rolling Stock.—The Soo Line has awarded a contract to the American Car & Foundry Co. for the repair of 500 box cars. The Chilean State Railways are in the market for 30 Mikado type locomotives. The Mississippi Central has ordered three switch engines from the American Locomotive Co.

Bars.—The Indiana Highway Department will soon advertise for bids on 21 reinforced concrete bridges and 13 culverts and these are said to be forerunners of other projects which are expected to be undertaken during the course of the year. The department's program, if carried out, will result in the purchase of between one and two million dollars worth of steel alone. In this connection it is to be noted, however, that highway programs undertaken in other Western States have thus far resulted in a disappointingly small volume of business. In general, the demand for mild steel bars is exceedingly light, and while price shading continues to be reported, it has not been brought into prominence through the placing of orders involving tonnage of consequence. Lack of business has resulted in practically a suspension of bar iron production and the same can be said of rail carbon steel bars.

Mill prices are: Mild steel bars, 2.10c., Pittsburgh, taking a freight of 38c. per 100 lb.; common bar iron, 2.25c. to 2.38c., Chicago; rail carbon, 2c. to 2.25c., mill or Chicago.

Jobbers quote 3.13c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars is 4.63c. for rounds and 50c. extra for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 2.88c. base.

Cast Iron Pipe.—Akron, Ohio, has rejected all bids on 3.2 miles of 48-in. pipe, despite the fact the figures on both steel and cast-iron pipe are said to have been exceedingly attractive. Although the bids covered the laying of the pipe, it is estimated that the low figure on steel pipe was based on 1.50c. plates. Akron will re-advertise. Other prospective business includes:

Marion, Ill., 600 tons, bids in June 13.

Eric, Ill., 250 tons, June 7.

Bellwood, Ill., amount not yet specified, June 15.

Minneapolis, 300 tons.

We quote per net ton f.o.b. Chicago, ex-warehouse as follows: Water pipe, 4-in., \$57.10; 6-in. and above, \$54.10; class A and gas pipe, \$3 extra.

Wire Products.—General reductions of \$5 a ton in wire and wire nails have brought plain wire down to \$2.75 per 100 lb. and wire nails to \$3 per keg base, Pittsburgh. It is too early to appraise the effect of the cuts on business. While the jobbers are not yet showing an inclination to let in stocks, it is notable that those serving the farm trade are buying more freely than those dependent more largely on the manufacturing trade. Local warehouse prices have also been reduced \$5 a ton.* For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 1582.

We quote warehouse prices, f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.63 per hundred pounds; No. 9 and heavier, bright basic wire, \$3.78 per hundred pounds; common wire nails, \$3.73 per hundred pounds; cement coated nails, \$3.15 per keg.

Old Material.—Buying by users is light and the weakness of the market has been reflected in further declines in a number of items. It is probable that more general reductions would be made but for the fact that some classes of scrap are not being bought at all. Among the few sales to consumers we note one of 600 tons of No. 1 busheling at \$9 per net ton and another of 300 tons of No. 1 wrought at \$10.50 a net ton. Dealers who laid in scrap at higher prices than those now quoted are beginning to fear that they may have to liquidate at a decided loss. If freight rates on scrap

should be reduced in the near future, their position would certainly not be strengthened. Railroad offerings include the Grand Trunk Western, 7400 tons; the Santa Fe, 1800 tons; the Missouri, Kansas & Texas, 1500 tons; the Great Northern, 2700 tons; the Michigan Central and the Lake Erie & Western, blank lists.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.50 to \$17.00
Relaying rails	30.00 to 35.00
Car wheels	13.50 to 14.00
Steel rails, rerolling	13.50 to 14.00
Steel rails, less than 3 ft.	13.00 to 13.50
Heavy melting steel	11.50 to 12.00
Frogs, switches and guards, cut apart	11.50 to 12.00
Shoveling steel	11.00 to 11.50
Low phos. heavy melting steel	14.00 to 14.50
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	7.50 to 8.00
Axle turnings	8.00 to 8.50

Per Net Ton	
Iron angles and splice bars	15.00 to 15.50
Steel angle bars	11.00 to 11.50
Iron arch bars and transoms	14.50 to 15.00
Iron car axles	20.00 to 20.50
Steel car axles	14.00 to 14.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	6.00 to 6.50
Cut forge	10.00 to 10.50
Pipes and flues	7.00 to 7.50
No. 1 railroad wrought	10.00 to 10.50
No. 2 railroad wrought	9.50 to 10.00
Steel knuckles and couplers	12.50 to 13.00
Coil springs	12.50 to 13.00
No. 1 machinery cast	13.00 to 13.50
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	11.00 to 11.50
Machine shop turnings	3.50 to 4.00
Cast borings	5.00 to 5.50
Stove plate	12.50 to 13.00
Grate bars	10.50 to 11.00
Brake shoes	11.00 to 11.50
Railroad malleable	12.00 to 12.50
Agricultural malleable	12.00 to 12.50
Country mixed	8.00 to 8.50

New York

NEW YORK, June 7.

Pig Iron.—The pig iron market has descended to new depths of dullness. The New Jersey melter which was mentioned last week as being in the market for 1200 tons has withdrawn the inquiry and will buy from month to month to meet its requirements. This and other companies having on hand, or to be delivered, tonnages bought at much higher prices are buying moderate tonnages at present low prices in order to reduce their average price. The New Jersey inquiry brought out some low quotations, as for example, a Buffalo furnace quoted \$22 furnace for iron analyzing 1.75 to 2.25 silicon. One company sold 500 tons Tuesday for prompt delivery. A few hundred tons of Pennsylvania iron has been sold at \$25.50, furnace, for No. 2X. High phosphorus Luxembourg iron averaging silicon 2.85 and phosphorus 1.90 is being offered for sale at \$28.50 per gross ton c.i.f. Philadelphia.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25	\$28.52 to \$29.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	27.52 to 28.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	26.52 to 27.52
Buffalo, sil. 1.75 to 2.25	32.46 to 33.46
No. 2 Virginia, sil. 1.75 to 2.25	31.16 to 32.16

Finished Iron and Steel.—The whole list of rolled steel products is decidedly weak and it is chiefly due to lack of attractive business that some prices have not been cut. The tendency to shade prices is more apparent on export inquiries than on domestic business, and the latter is confined to such small orders that the incentive to make concessions is lacking. Plates, shapes, bars and sheets are soft, while wire products have been reduced \$5 a ton by the leading interest and independents. The fact that wire rods have not been reduced proportionately will probably work somewhat of a hardship to those companies which do not make their own steel. New prices on wire products are 3c. for nails, 2.75c. for bright and annealed wire and 3.85c. for barbed wire, all f.o.b. Pittsburgh. In plates 2c., Pittsburgh, is to-day's market on carload lots; 2.20c. on less than carloads, while an attractive specification of 100 tons or more would likely bring out quotations of 1.95c., Pittsburgh, or even lower. Evidence is lacking of shaded prices on structural shapes for domestic use, but on an inquiry for 1800 tons for a bridge in Japan.

put out by Suzuki & Co., New York, bids of 2c., Pittsburgh, have been submitted. It is known that some fabricators who were recently awarded structural jobs are delaying the placing of the plain material, apparently expecting lower prices. An interesting variation in bids on reinforcing bars was noted at the opening by the United States Shipping Board on June 3, the inquiry calling for 410 tons for Norfolk, Va. The lowest bid was \$31, f.o.b. Marietta, Pa., but this was for rusted material. On rail carbon bars a company at Franklin, Pa., put in a bid of \$37 per net ton, f.o.b. mill. A Perth Amboy company quoted \$43.20, mill, and another bid on mild steel was 2c., Rockaway, N. J., mill. Another bid of 2c., mill, was put in by a Columbia, Pa., company, but the material offered was to be re-rolled from soft steel scrap. Other bids were 1.99c., Pittsburgh; 2.54c., delivered Norfolk, and the larger independent mills quoted 2.10c., Pittsburgh. In structural material there is a pronounced tendency to postpone work that has been estimated upon by fabricators. Conspicuous among the projects which have been indefinitely deferred are the Chesapeake & Ohio Railroad bridge, 1500 tons; tanks for the United States Shipping Board; 900 tons for the Pennsylvania Sugar Co., Philadelphia; 1200 tons for the Chamber of Commerce, Newark, N. J.; 300 tons for the National Folding Box Co., New Haven, Conn. Bids close this week on 1500 tons for a bank at Fort Wayne, Ind., and 400 tons for a chemical laboratory at Cornell University. The Bethlehem Fabricators, Inc., was awarded 450 tons for the State of New Jersey Hospital at Morris Plains and 600 tons for the Great Northern Paper Co., Millinocket, Me., is reported to have been placed. The Pittsburgh & West Virginia Railroad is expected to place orders this week for the repair of 500 steel hopper cars, 250 of which are to have new steel bodies. If the deal can be financed the Mexican Government may purchase 100 locomotives. It is expected the business will be equally divided between the American Locomotive Co. and Baldwin Locomotive Works. A Mexican commission is here now trying to arrange the transaction.

We quote for mill shipments, New York, as follows. Soft steel bars, 2.48c., plates, 2.38c. to 2.58c., structural shapes, 2.58c.; bar iron, 2.28c.

Ferroalloys.—There continues to be almost no demand for ferromanganese or spiegeleisen and quotations are nominally unchanged. While it is thought that these could be shaded there has been no test of the market. Demand for spiegeleisen is confined to a few inquiries for carload lots. At last the production of both alloys has fallen to totals which are now in keeping with the present condition of the steel industry. As indicated in the blast furnace reports on other pages the ferromanganese output for May was only 6853 tons as compared with 9566 tons in April, and an average of 19,178 tons per month the first quarter of this year. The spiegeleisen output was only 2379 tons, as compared with 14,744 tons in April and 11,666 tons in the first quarter of this year. The manganese ore market is inactive and nominal. The 50 per cent ferrosilicon market is also inactive with quotations nominal.

Ferromanganese, domestic, delivered, per ton	\$30.00
Ferromanganese, British, seaboard, per ton	\$75.00
Spiegeleisen, 20 per cent, furnace, per ton,	\$30.00 to \$32.00
Ferrosilicon, 50 per cent, delivered, per ton,	\$50.00
Ferrotungsten, per lb. of contained metal, 48c. to 58c.	
Ferrochromium 6 to 8 per cent carbon, 60 to	
70 per cent Cr., per lb. Cr.,	16c. to 16.50c.
Manganese ore, foreign, per unit, seaboard,	22.50c.

Warehouse Business.—Slackness continues with prices largely nominal among dealers heavily stocked. A large mill interest is reported to have unofficially offered wire nails, per keg, at a considerable concession to customers, which is viewed in some quarters as the forerunner of an official reduction on other wire products. Prices show no change and business is unimproved. We quote prices on page 1594.

High Speed Steel.—The market remains sluggish, although some producers report a slight improvement in sales to manufacturers of textile machinery and similar lines. A mill manufacturing corrugated bars and other products recently purchased what is at present a heavy order, about 5000 lb. We quote 18 per cent tungsten high speed steel at 90c. to \$1 per lb.

Cast Iron Pipe.—Reductions of \$5 in price have been made in the base size, 6 in., and of \$10 in the smaller sizes. The largest municipal inquiry is that of the city of Norfolk, Va., for a large tonnage of 30-in. flexible joint pipe, bids to be opened June 9. Pipe manufacturers are probably busier than makers of any other iron and steel commodities. The new prices, f.o.b. New York, for carload lots follow: 6-in. and larger, \$53.30; 4-in. and 5-in., \$58.30; 3-in., \$68.30, with \$4 additional for Class A and gas pipe.

Coke.—Some merchants report more satisfactory sales in foundry coke than in pig iron. The price centers around \$5, Connellsville, for guaranteed coke, though unguaranteed coke is obtainable at \$4.50. One maker of by-product coke in this district still adheres to the \$5.50, Connellsville, price. New England ovens are attempting to secure contract business for future delivery though the response is not active.

Old Material.—Prices are stable for the simple reason that there is little business. An eastern Pennsylvania heavy melting steel consumer which offered \$12.50, delivered, a short time ago, now offers only \$12. There is a slight demand for stove plate and pipe. The fair demand for cast a week ago has subsided. Dealers are watching with interest the agitation for a reduction of freight rates, which would allow them to make more long distance shipments with profit.

Buying prices per gross ton, New York, follow:

Heavy melting steel	\$7.00 to \$7.50
Re-rolling rails	9.50 to 10.00
Relaying rails, nominal	40.00 to 42.50
Steel car axles	10.50 to 11.00
Iron car axles	17.00 to 18.00
No. 1 railroad wrought	10.00 to 11.00
Wrought iron track	7.25 to 7.50
Forge fire	5.00 to 5.50
No. 1 yard wrought, long	8.50 to 9.00
Light iron	2.00 to 3.00
Cast borings (clean)	4.00 to 4.50
Machine-shop turnings	3.00 to 4.00
Mixed borings and turnings	3.00 to 3.50
Iron and steel pipe (1 in. diam. not under 2 ft. long)	8.00 to 8.50
Stove plate	9.00 to 9.50
Locomotive grate bars	8.50 to 9.00
Malleable cast (railroad)	8.00 to 8.50
Old car wheels	13.00 to 13.50

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast	\$16.00 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	15.00 to 16.00
No. 1 heavy cast, not cupola size	10.00 to 11.00
No. 2 cast (radiators, cast boilers, etc.)	10.00 to 11.00

Cincinnati

CINCINNATI, June 7.

Pig Iron.—A Kentucky melter is in the market for 500 tons of Southern iron and 250 tons of either Northern or Virginia iron for June shipment. The National Cash Register Co., Dayton, Ohio, has sent out an inquiry for 320 tons half Northern and half Southern and a central Ohio melter inquired for 500 tons of malleable but almost immediately withdrew the inquiry. With these exceptions the market is very quiet, the largest sale reported in this territory being one of 200 tons of Northern iron to an Indiana melter. The American Radiator Co. is reported to have closed for 300 tons of Southern iron for its Birmingham plant. Prices are inclined to weakness and a sale of 100 tons of Southern iron was made during the week at \$21.75, Birmingham. Carload sales of Southern iron, however, are still being made at \$22.50 to \$23, but it is said that on a round tonnage \$21 could be done. Some southern Ohio high silicon iron was sold last week on the basis of \$23, Iron-ton, but sales are still being made at \$24. There is no activity in either silvery or basic.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Iron-ton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base)	\$26.50
Southern coke, sil. 2.25 to 2.75 (No. 2 soft)	27.50
Ohio silvery, 8 per cent sil.	38.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2)	25.52
Basic, Northern	25.52
Malleable	26.52

Finished Material.—Rumors of lower prices continue to be heard on all lines of finished products.

This is particularly so in the case of black and galvanized sheets and on an inquiry of five or six carloads for a West Virginia manufacturer it is reported that quotations ranging from \$4 to \$6 a ton below the stabilized prices were made. So far as can be learned, this business has not been placed. A sale of 530 tons of reinforcing bars was made to a local contractor during the week. The price has not been announced, but on the straight bars it is said that 2.32½c. delivered Cincinnati, took the business and on bent bars 2.40c. delivered. Some readjustment in wire prices has been made by one of the leading companies, to meet prices quoted by some of the smaller mills, and it is reported that the Steel Corporation subsidiary is also inclined to meet the present market. Some inquiries are being received for bale ties, wire fence and wire nails. Some plate business was also placed during the week and several carload lots of structural material were booked at the stabilized price. Some interest was also shown in steel pipe, several users placing fair sized orders. In the structural field, no projects of any size are up for bids. It is expected that bids will be asked on June 15 for the construction of the stadium at Ohio State University. This will take approximately 3500 tons of reinforcing bars and about 750 tons of structural steel. Several high school buildings in this section of the State will also shortly be up for bids. Plant operations will not change materially during the week, the mills in this territory running approximately 40 to 50 per cent, which is slightly above the general average of the independents.

Warehouse Business.—Business continues light and small orders for immediate shipment are about the only activity. No price changes are reported and none is anticipated for some time.

Iron and steel bars, 3.35c. base; hoops and bands, 4.05c. base; shapes, 3.45c. base; plates, 3.45c. base; reinforcing bars, 3.42½c. base; cold rolled rounds 1½ in. and larger, 4.85c.; under 1½ in. and flats, squares and hexagons, 5.35c.; No. 10 blue annealed sheets, 4.35c.; No. 28 black sheets, 5.50c.; No. 28 galvanized sheets, 6.50c.; wire mills, \$3.60 per keg base; No. 9 annealed wire, \$3.60 per 100 lb.

Coke.—The coke market is unusually quiet, only an occasional carload sale being reported. Prices are, if anything, a little softer. It is reported that additional ovens in the West Virginia field will go out shortly owing to lack of orders.

Old Material.—There is no activity in the scrap market and some dealers state that the present stagnation is unprecedented. Prices quoted in the absence of transactions can be regarded only as nominal.

We quote dealers' buying prices:

	Per Gross Ton	
Bundled sheets	\$2.50 to \$3.50	
Iron rails	16.50 to 17.50	
Relaying rails, 50 lb. and up	30.50 to 31.50	
Re-rolling steel rails	11.50 to 12.50	
Heavy melting steel	10.00 to 11.00	
Steel rails for melting	10.50 to 11.50	
Car wheels	14.00 to 15.00	

Per Net Ton

No. 1 railroad wrought	10.00 to 11.00
Cast borings	5.00 to 5.50
Steel turnings	3.50 to 4.00
Railroad cast	13.50 to 14.50
No. 1 machinery	13.50 to 14.50
Burnt scrap	8.00 to 9.00
Iron axles	20.00 to 20.50
Locomotive tires (smooth inside)	10.00 to 11.00
Pipes and flugs	7.50 to 8.00

Youngstown Companies Reduce Salaries

YOUNGSTOWN, OHIO, June 7.—Incoming business of the Youngstown Sheet & Tube Co. averages between 15 and 20 per cent, the lowest rate in years, state officials. New business with other Valley independents is at the same rate or less. Independents are reducing salaries of officials from 15 to 30 per cent in efforts to lower costs. Effective June 16 the Brier Hill Steel Co. will cut officials' salaries 15 per cent.

"We are losing money on operations and are continuing our efforts to spare operating and overhead costs," states President James A. Campbell of the Sheet & Tube company. "There will be no bonuses for officials and salaries must likewise be reduced."

Cleveland

CLEVELAND, June 7.

Iron Ore.—It is expected that ore prices for the season will be established within a week. The first actual sale for 1921 has been made, this being included in a new long time contract which specifies that whatever shipments may be made this season shall be at the going market price and other inquiries have come out for approximately 100,000 tons of ore, including one lot of 65,000 tons. In addition to these inquiries, another factor that will doubtless lead to the naming of prices without further delay is that some consumers who are taking ore on long time contracts are getting anxious to have prices fixed so that they will know what the ore they are taking is going to cost them. Some buying will follow the establishment of prices, but sales will be very light. Ore shipments during May were only 2,594,027 gross tons, or the smallest movement in May since 1908. During May last year shipments were 6,976,085 tons. Shipments for the season to June 1 were 2,770,238 tons. Shipments are not increasing. However, the June movement will show a gain over May, as very little ore was moved before the middle of May.

We quote delivered lower lake ports: Old range Bessemer, \$7.45; old range non-Bessemer, \$6.70; Mesabi Bessemer, \$7.20; Mesabi non-Bessemer, \$6.55.

Pig Iron.—The market is dull and weak. Foundry iron prices have declined at least 50c. per ton to \$22.50 for No. 2, at which some small lot sales have been made and there are reports of quotations as low as \$22. However, a few furnaces are still asking \$23. Some of the low prices are coming from other than Lake furnaces. A Barberton, Ohio, consumer has placed 500 tons of foundry iron and neither this iron nor 350 tons recently inquired for by the American Radiator Co. for its Springfield, Ohio, plant went to a Cleveland furnace. The radiator company which recently inquired for 200 tons for its Titusville plant has sent out another inquiry for the same amount for that plant. The Standard Sanitary Mfg. Co. has inquired for 500 tons of Southern foundry iron for its Louisville plant for June shipment, and it is expected to come into the market in a day or two for a good sized lot of Northern iron for June shipment. The American Car & Foundry Co. has inquired for 100 tons of foundry iron for its Berwin, Pa., plant. Two or three inquiries have come from the East for 300 to 400 ton lots. One local interest reports sales of only 600 tons during the week. Car lot sales of low phosphorous iron are reported at \$39 and \$40 and a Pittsburgh consumer is inquiring for 500 tons of this iron. Many of the small lot foundry iron sales are being made to consumers that are buying low priced iron to average down prices on their high priced contracts. The falling off in the automobile business has resulted in cutting down shipments of foundry iron. On the other hand, one jobbing foundry which has not taken any iron this year has released over 500 tons for June shipment.

Basic	\$23.46
Northern No. 2 fdy. sil. 1.75 to 2.25	24.50
Southern fdy. sil. 2.25 to 2.75	29.92
Ohio silvery, sil. 8 per cent	38.86
Standard low phos., Valley furnace	\$39.00 to 40.00

Finished Iron and Steel.—The volume of business has fallen off and orders are extremely light. There are further reports of price shading on steel bars, plates and structural material, but most mills are adhering to regular prices. Virtually no business is coming from the automobile industry. Mills and parts manufacturers are awaiting an announcement from the Ford Motor Co. as to its plans for July production. This company has been placing orders early in the month for its requirements for the following month, but has as yet sent out no requirements for July. There has been a curtailment of operations in plants making alloy steels for the automobile trade. The building strike in Cleveland, after lasting five weeks, has been settled by an arbitration agreement and this is expected to result in more activity in the building field. The Jones & Laughlin Steel Co. has taken 1400 tons of structural material for a crusher plant for

the Kelly Island Lime & Transportation Co. at approximately \$85 per ton fabricated and erected, which is regarded as a very low price. As low as \$64 was bid on this building fabricated but not erected. Bids for the Ohio State University stadium will be taken June 15. This will require 2000 tons of reinforcing bars in addition to 2500 tons of structural material. A new low price of 1.85c. on hard steel reinforcing bars has been made on a Government inquiry for 400 tons for work at Norfolk, Va. The usual quotation is 1.90c. Following a reduction to 2.75c. on plain wire, a concession to 2.90c. is reported to have been made on nails by one small mill. The Cleveland Railway Co. has placed 500 tons of standard rails with the Lackawanna Steel Co.

Cleveland warehouses quote steel bars and small shapes at 2.99c.; plates, 3.09c.; structural shapes, 3.09c.; No. 9 galvanized wire, 4.45c.; No. 9 annealed wire, 3.73c.; No. 28 black sheets, 4.80c.; No. 28 galvanized, 5.70c.; No. 10 blue annealed, 3.85c. to 4c.; hoops and bands, 3.69c.; shafting, 4.25c.

Sheets.—The demand for sheets is quieter than it has been. A little price shading is reported on all grades. However, most mills are adhering to regular quotations.

Track Supplies.—Sharp cuts in prices on spikes and track bolts have been made in this territory and are attributed to a Chicago mill. Quotations of around 3c. to 3.10c., Pittsburgh, were reported on spikes and 3.62c. on track bolts.

Coke.—Foundry coke prices have declined about 25c. a ton. Some carlot sales are being made at \$5 to \$5.50 for standard Connellsville brands.

Bolts, Nuts and Rivets.—The demand for bolts and nuts is still very light and a number of manufacturers are operating their plants at only 25 to 30 per cent of capacity. Small orders are being booked at regular prices, but makers admit that a good inquiry would probably bring out concessions. The inquiry for 1,036,000 1½-in., 3½ per cent nickel steel bolts, amounting to several thousand tons, for the New York vehicular tunnel has been held up temporarily. The rivet market is very dull and prices are irregular with a spread of at least \$2 a ton in quotations.

Old Material.—The scrap market is almost at a standstill. The only activity is in a limited amount of trading between dealers, and consumers' prices are to a large extent nominal. One Cleveland mill has shut off shipments of heavy melting steel scrap, but another consumer is still taking borings and turnings. Small lot purchases by dealers are reported at \$7.50 to \$8 for mixed borings and \$11 for heavy melting steel. Quotations are unchanged.

We quote per gross ton delivered consumers' yards in Cleveland and vicinity as follows:

Heavy melting steel	\$11.50 to \$12.00
Steel rails under 3 ft.	13.50 to 14.00
Steel rails, retolling	15.00 to 16.00
Iron rails	13.00 to 14.00
Iron car axles	20.00 to 21.00
Low phosphorus melting scrap	14.00 to 15.00
Cast borings	8.00 to 8.25
Machine shop turnings	6.50 to 7.00
Mixed borings and short turnings	8.00 to 8.25
Compressed steel	10.00 to 10.50
Railroad wrought	12.00 to 13.00
Railroad malleable	13.00 to 14.00
Light bundled sheet stampings	5.00 to 6.00
Steel axle turnings	10.00 to 10.50
No. 1 cast	17.00 to 17.50
No. 1 bushing	7.50 to 8.00
Drop forge flashings, over 10 in.	5.50 to 6.00
Drop forge flashings, under 10 in.	6.00 to 6.50
Railroad grate bars	13.50 to 14.00
Stove plate	13.50 to 14.00
Pipes and flues	7.00 to 8.00

High Cost of Shipping Ore

CLEVELAND, June 7.—Ore consumers have presented to shippers interesting figures showing transportation costs, using these as a reason for holding up shipments of ore contracts this season. The total cost of transporting ore from the mines to a Valley furnace at present is \$3.13 per ton including war tax. They have estimated a possible reduction of 64c. per ton in transportation and handling including a 30c. reduction from the mines to upper lake docks and adding to this 22c. interest on the transportation charge for a year and 10c. for additional State tax on ore carried at Lake Erie docks or furnace yards as compared with the tax if the ore is left in the mines, makes a total of 96c.

a ton higher cost for moving ore this year as compared with their estimates for next year. This figure does not take into consideration increase in inventory, possible lower labor costs next year for unloading and lower royalties next year should the 1922 ore prices be lower than this year's prices. Ore shippers are using the same figures as an argument for the immediate reduction of transportation costs.

Boston

BOSTON, June 7.

Pig Iron.—Little business was transacted the past week. One house reports a sale of 200 tons eastern Pennsylvania No. 1 X at about \$31, delivered to an eastern Massachusetts foundry, which figures out about \$24.50 furnace for silicon 1.75 to 2.25. Another house reports other sales of silicon 2.25 to 2.75 in car lots, totaling 175 tons, at \$26 furnace and 100 tons No. 2 X Virginia at \$27, furnace. Otherwise little has been done. The undertone of the market for Virginia irons appears firmer due to a lack of resale lots offered. An eastern Pennsylvania furnace previously on a basis of \$28, \$29.25 and \$31 for No. 2 plain, No. 2 X and No. 1 X, now quotes \$27, \$28 and \$29, respectively, but it is still out of line with most furnaces. Buffalo iron is an indefinite factor in this territory. What could be done on sizable orders is problematical. It now develops that some sales of eastern Pennsylvania iron reported recently represented readjustments on contracts. Delivered pig iron prices follow:

East Penn., silicon 2.25 to 2.75	\$28.56 t	\$29.56
East Penn., silicon 1.75 to 2.25	27.56 t	28.56
Buffalo, silicon 2.25 to 2.75	30.46 t	32.46
Buffalo, silicon 1.75 to 2.25	29.46 t	31.46
Virginia, silicon 2.25 to 2.75	33.58 t	35.83
Virginia, silicon 1.75 to 2.25	32.58 t	33.58
Alabama, silicon 2.25 to 2.75	33.66 t	34.16
Alabama, silicon 1.75 to 2.25	33.16 t	33.66

Finished Materials.—Slightly more figuring on structural steel tonnages, but no increase in actual tonnages booked is reported. Reinforcing bars market is more active than others, yet aggregate tonnage involved does not exceed 1000 tons. Small mills have quoted as low as 1.75c. f.o.b. Pittsburgh on a 125-ton lot and 1.90c. on similar tonnages, while important interests hold to 2.10c. Mill representatives report the market for finished materials in general was less active the past week than for any similar period this year. Buyers are still dickering on rail and plate tonnages reported last week.

Warehouse Business.—Movement of iron and steel out of stock continues as heretofore and at unchanged prices. Bolts and nuts are perhaps a shade more active, but business is spotty. Wire nails have been cut from 4.35c. to 4.10c. per keg base, and there has been a further readjustment in cut nails from \$6.75 to \$5 per keg base from store. Barbed wire is 25c. per 100 lb. cheaper.

Jobbers now quote: Soft steel bars, \$3.18 per 100 lb. base; flats, \$4.18 to \$4.28; concrete bars, \$3.18 to \$3.45½; tire steel, \$4.25 to \$4.75; spring steel, open hearth, \$5.50; crucible, \$11.50; steel bands, \$3.83 to \$4.48; steel hoops, \$4.38; toe calk steel, \$5.25; cold rolled steel, \$4.65 to \$5.15; structural, \$3.18 to \$3.28; plates, \$3.48 to \$3.50; No. 10 blue annealed sheets, \$4.55; No. 28 black sheets, \$5.85; No. 28 galvanized sheets, \$6.85; refined iron, \$3.18 to \$5; best refined, \$5; Wayne iron, \$8.50; Norway iron, round, ¼-in. to 2½-in., 8c. per lb. net; other sizes, 10c. base.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. have announced June foundry coke prices. Spot fuel is now \$11.41 delivered where the local freight does not exceed \$3.40, and contract coke \$11.16 delivered. These prices are practically on a \$5.25 and \$5 respectively, f.o.b. Connellsville oven base. Both companies report a considerable increase in releases on contracts with little improvement in new business. Connellsville foundry cokes are offered at \$5 per ton and occasionally at 25c. per ton less. Only scattering car lots have been taken.

Old Material.—Some dealers quote No. 1 machinery cast at slightly higher prices due to car lot sales of selected textile machinery at \$19 delivered and slightly higher. A majority, however, have not been able to secure more than \$18 delivered for what little they have sold since last reports. A Massachusetts railroad equipment manufacturer has purchased about eight

cars stove plate at \$15.50 and \$16 delivered. Quotations on railroad malleable have fallen below those of stove plate in the absence of inquiries. A Maine melter paid \$9 delivered for a car of cotton ties, and a New England horseshoe maker \$16 delivered for 100 tons of strictly No. 1 railroad wrought, while a dealer has taken on a limited tonnage of wrought pipe at \$7.50 on cars shipping point.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery cast.....	\$18.00 to \$19.00
No. 2 machinery cast.....	16.00 to 17.00
Stove plate.....	15.00 to 15.50
Railroad malleable.....	14.50 to 15.00

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$7.00 to \$7.50
No. 1 railroad wrought.....	10.00 to 11.00
No. 1 yard wrought.....	9.00 to 9.50
Wrought pipe (1-in. in diam., over 2 ft. long).....	7.00 to 7.50
Machine shop turnings.....	3.00
Cast iron borings, rolling mill.....	3.00 to 4.00
Cast iron borings, chemical.....	3.00 to 4.00
Blast furnace borings and turnings.....	3.00
Forged scrap and bundled skeleton.....	4.00 to 5.00
Street car axles and shafting.....	12.00 to 13.00
Car wheels.....	12.00 to 12.50
Revolving rails.....	9.00 to 9.50

Buffalo

BUFFALO, June 7.

Pig Iron.—Approximately 2000 tons was sold last week by Buffalo furnaces through their several offices at the \$24 and \$25 base prices, but on the whole business is quieter. Improvement hoped for by several furnace interests has failed to materialize. Sales are mostly for carload lots. One furnace has sold practically all its iron in stock and as its furnace has been down for weeks, it is completely withdrawn as a factor in this district. The trend of business is indicated in the inquiry reported by one producer; an aggregate of 4000 tons in 20 separate inquiries.

We quote f.o.b. dealers' asking prices per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.....	\$26.00 to \$27.00
No. 2X foundry, 2.25 to 2.75 sil.....	25.00 to 26.00
No. 2 plain, 1.75 to 2.25 sil.....	21.00 to 25.00
Basic (nominal).....	23.00 to 24.00
Malleable nominal.....	21.00 to 25.00
Lake Superior charcoal.....	35.00

Finished Iron and Steel.—Continued dullness marks this market. Business is no better with any company and worse with several. With one producer operation is on the same scale as for the last two months. The only mill which has improved its schedule is now working about 50 per cent of normal in all departments except rails. Sufficient orders are on hand or in sight to continue this capacity for some time. Bars are more in demand than any other material with this mill. A number of reinforcing bar inquiries were received by local mills, but none of the orders was placed here. One mill refused to quote knowing its price was prohibitive. Demand is good for wire cloth and netting with one maker and fabric used in road construction is also active. This mill has sufficient orders on hand to continue its present schedule for the summer. The Kellogg Structural Steel Co. will fabricate 150 tons for St. Peter and Paul's school, Buffalo, and 100 tons for the Alberger Pump Co., Newburgh, N. Y. Small mills are shading pipe prices but no tonnage has been brought out as a result.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 3.25c.; plates, 3.25c.; plates, No. 8 gage, 4.10c.; soft steel bars and shapes, 3.15c.; hoops, 3.85c.; blue annealed sheets, No. 10 gage, 4.15c.; galvanized steel sheets, No. 28 gage, 6.30c.; black sheets, No. 28 gage, 5.30c.; No. 9 gage annealed wire, 4.35c.; cold rolled strip steel, 8.15c.

Warehouse Business.—Prices on bolts, nuts, wire nails and rivets have been reduced by one warehouse interest and aggregate about 10 per cent all along the line. Better business in structural material to be used in bridge construction is seen as a number of public improvements along the highways are started. No change has been made on the so called major lines such as sheets, bars and plates. The volume of business continues even and has not changed perceptibly in six weeks. Reinforcing bar business has improved slightly with the advent of public improvements.

Old Material.—Dealers say the market is less active than at any time since the depression set in. All sales are for trivial tonnages. The activity in heavy melting steel which occupied a number of dealers has quieted and apparently the entire order placed by a railroad equipment maker has been filled. Prospective business indicates a quiet summer period.

We quote dealers' asking prices per gross ton, f.o.b. Buffalo, as follows:

Heavy melting steel.....	\$12.50 to \$13.00
Hydraulic compressed.....	9.00 to 9.50
Low phos., 0.04 and under.....	17.00 to 18.00
No. 1 railroad wrought.....	13.00 to 14.00
Car wheels.....	16.00 to 17.00
Railroad malleable.....	11.50 to 12.50
Machine shop turnings.....	7.00 to 8.00
Heavy axle turnings.....	10.00 to 11.00
Clean cast borings.....	7.00 to 8.00
Locomotive grate bars.....	11.50 to 12.50
Wrought pipe.....	9.50 to 10.50
No. 1 busheling.....	9.50 to 10.50
Stove plate.....	15.00 to 16.00
Bundled sheet stampings.....	7.00 to 8.00
No. 1 machinery cast.....	18.00 to 18.50

Birmingham

BIRMINGHAM, ALA., June 7.

Pig Iron.—The largest transaction of the week was 25,000 tons to the National Cast Iron Pipe Co. reported to have gone at a very low price. A sale of 800 tons for the Pacific Coast was made. Special shipping arrangements in vessels out of a gulf port are understood to have helped this sale. Several lots of 100 tons were sold for Western delivery and numerous car lots. Many new customers appeared in the market for rush car loads. Inquiry is brisker. Stocks are running low all over the South and Southwest. No large deals are reported. The high price now is \$22.50 with any tonnage around 200 and up selling at \$22. Average silicon differentials are not over \$1.

We quote per gross ton f.o.b. Birmingham district furnace, as follows:

Foundry, sil. 1.75 to 2.25.....	\$22.00
Basic.....	21.00
Charcoal.....	35.00

Plant Operations.—Several iron consumers in the Birmingham district report greater operations. Radiator works are reported at normal and one large maker of sugar refinery castings is also at normal. Shipments have been good. One interest more than moved its one-furnace make. Another has reduced stocks by 8000 tons. This week witnesses the beginning of regular operations of the pressed steel car plant of the Chickasaw Shipbuilding & Car Co. with capacity of 15 to 25 standard freight cars per diem and orders for 1000 cars on hand. Ingot production of the Tennessee company is at 50 per cent with the rail mill on a continuing normal base. Japan is taking 4500 tons of rails. The Gulf States Steel Co. is running in all departments at 50 per cent capacity.

Coal and Coke.—Numerous reductions in wages have been made at coal mines at request of miners who appealed to operators to get business at reduced prices from competitors. Union as well as non-union mines have done this.

Old Material.—The scrap market still fails to show signs of revival, although No. 1 heavy steel is seemingly in better demand. Transactions are light.

We quote per gross ton f.o.b. Birmingham district yard as follows:

Old steel rails.....	\$10.00 to \$11.00
No. 1 steel.....	9.00 to 10.00
No. 1 cast.....	16.00 to 17.00
Car wheels.....	16.00 to 17.00
Tramcar wheels.....	15.00 to 16.00
No. 1 wrought.....	13.00 to 14.00
Stove plate.....	9.00 to 10.00
Cast iron borings.....	6.00 to 7.00
Machine shop turnings.....	6.00 to 7.00

A manufacturers' power conference has been called by the Water Power League to meet at the Waldorf-Astoria, New York, June 21 and 22, to discuss the development of power for manufacturing and other purposes. Featured discussions will consider the Federal power act and the super power zone plan.

Philadelphia

PHILADELPHIA, June 7.

Steel companies admit that prices are soft, though denying that any great amount of cutting has yet been done except on plates, the price of which is now regarded as 2c., Pittsburgh, with the probability that lower quotations would be made on any desirable tonnage. There seems no longer to be any question that the prices uniformly adopted several weeks ago by the Steel Corporation and the independent companies have been abandoned in spirit, at least, and the fact that few low prices have actually been quoted has been due principally to lack of desirable specifications.

The steel trade has done very little business in the past two weeks. Demand is at the lowest point since the present depression set in. This situation also applies to pig iron.

Pig Iron.—Following a sale of 300 tons of No. 2 plain iron to a radiator plant at Trenton, N. J., at \$23, furnace, an Eastern producer of pig iron decided to advance its price to \$24, base, with \$25 for No. 2 X and \$26 for No. 1 X. Other Eastern producers intimate that they also will adhere to these prices, which constitute an advance of \$1 on No. 2 plain from the low point, 50c. to \$1 on No. 2 X and about the same amounts on No. 1 X. These low prices have been made only on the most desirable tonnages, carload lots being quoted about \$1 a ton above the minimum levels. The demand for iron shows no improvement; in fact, in the past week or two there has been a falling off in the demand. No sales are reported as yet on the new price basis, and in view of this we continue our quotations as of last week.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.54 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25	\$24.75 to \$25.25
East. Pa. No. 2X, 2.25 to 2.75 sil.	25.50 to 26.25
Virginia No. 2 plain, 1.75 to 2.25 sil.	31.74
Virginia No. 2X, 2.25 to 2.75 sil.	32.99
Basic deliv. Eastern Pa.	25.00
Gray forge	25.26
Standard low phos. (f.o.b. furnace)	38.00
Malleable	28.00 to 29.00
Copper bearing low phos. (f.o.b. furnace)	35.00

Semi-Finished Steel.—Reports of sales of German sheet bars in this country are not confirmed. It has been stated that one lot was sold at \$34, delivered New York. The demand for billets is negligible. Price quotations are unchanged, \$37 for rerolling quality and \$42 for forging quality, f.o.b. Pittsburgh.

Coke.—Blast furnace coke is now offered in this district at a shade under \$3.25, Connellsville. Foundry coke remains unchanged, \$5 to \$5.50.

Plates.—Even those companies which are still adhering to 2.20c., Pittsburgh, admit freely that practically all of the business which has been placed in the past week or two has gone at 2c., Pittsburgh, or less. A coal company is reported to have bought 100 tons at 2c. On less than carloads the 2.20c. price is being maintained, but on lots of a carload or more of desirable sizes, even 2c. has been shaded. The cut prices have benefited two or three mills in a small degree, as much of the current business has gone to them, but on the whole the demand for plates has not been increased by the naming of the lower prices.

Structural Material.—Very little business in shapes is offered, but prices are soft. Some of the steel companies are convinced that plain material has been sold at 2c., Pittsburgh, by an Eastern mill, but positive evidence is lacking. Fabricators are making extremely low prices, \$60 to \$62, fabricated and delivered, which leaves a very small margin for fabrication and shipping costs over the price of the plain material. Most of the structural jobs now being placed are under 100 tons, and even these are few in number.

Bars.—The only demand is for reinforcing bars and the rerolling mills, which are quoting about 1.75c., Pittsburgh, on rerolled material, are getting most of this business. Soft steel bars are quoted at 2.10c., Pittsburgh, by the leading producers.

Sheets.—Lower prices on sheets are being named by some mills. Very little business is being done in this district.

Warehouse Business.—Demand for steel out of stock has dropped within the last two weeks to the lowest point of the year. Prices are unchanged, the following being named for Philadelphia delivery with reductions of \$2 or \$3 a ton, depending on the grade, for shipment out of town:

Soft steel bars and small shapes, 3.20c.; iron bars (except bands), 3.20c.; round edge iron, 3.50c.; round edge steel, iron finish, 1½ in. x ½ in., 3.50c.; round edge steel, planished, 4.25c.; tank steel plates, ¼-in. and heavier, 3.30c.; tank steel plates, 3/16-in., 3.52c.; blue annealed steel sheets, No. 10 gage, 4.20c.; light black steel sheets, No. 28 gage, 5c.; galvanized sheets, No. 28 gage, 6c.; square twisted and deformed steel bars, 3.20c.; structural shapes, 3.30c.; diamond pattern plates, ¼-in., 5.05c.; 3/16-in., 5.27c.; ½-in., 5.37c.; spring steel, 5c.; round cold-rolled steel, 4.60c.; squares and hexagons, cold-rolled steel, 5.10c.; steel hoops, No. 13 gage and lighter, 3.85c.; steel bands, No. 12 gage to 3/16-in. inclusive, 3.85c.; iron bands, 4.50c.; rails, 3.20c.; tool steel, 12c.; Norway iron, 8c.; toe steel, 4.50c.

Old Material.—A slight improvement in the demand for scrap is noted. Several of the Eastern steel mills are buying such quantities as can be obtained, but have reduced their price to \$11.50, delivered, for No. 1 heavy steel. Dealers are paying \$12 for steel scrap for storage. The tendency of prices, where changes have occurred, has been downward. We quote for delivery at consuming points in this district as follows:

No. 1 heavy melting steel	\$11.50 to \$12.00
Scrap rail	11.00 to 11.50
Steel rails, rerolling	15.00 to 15.50
No. 1 low phos., heavy 0.04 and under	17.00 to 18.00
Car wheels	18.00 to 19.00
No. 1 railroad wrought	15.00 to 16.00
No. 1 yard wrought	14.00 to 15.00
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	8.00 to 8.50
No. 1 busheling	12.00 to 12.50
No. 2 busheling	10.00 to 11.00
Turnings (short shoveling grade for blast furnace use)	8.00 to 8.50
Mixed borings and turnings (for blast furnace use)	8.00 to 8.50
Machine-shop turnings (for rolling mill and steel works use)	8.50 to 9.00
Heavy axle turnings (or equivalent)	10.00 to 11.00
Cast borings (for rolling mills)	9.50 to 10.00
Cast borings (for chemical plants)	10.50 to 11.50
No. 1 cast	17.50 to 18.00
Railroad grate bars	12.50 to 13.00
Stove plate (for steel plant use)	12.50 to 13.00
Railroad malleable	15.50 to 16.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to 13.50
Iron car axles	No market
Steel car axles	No market

St. Louis

ST. LOUIS, June 7.

Pig Iron.—It seems practically impossible to move the pig iron market out of the doldrums in which it has continued for so long and the transactions are so few, so small and otherwise so uninteresting that the market may be regarded as entirely without feature. The expected activity, as a result of the settlement of the stove molders' scale, has not developed and in one or two instances stove molders have asked that shipments under contracts be deferred on account of the condition of their yards. Southern iron is still unable to compete with Northern iron in price and such few sales as are made of car lots are invariably either of Northern iron or from the local furnace which is operating on the East side. The West side furnace is still shut down. The East side furnace is delivering about half of its output to its allied interests and delivering it hot, while the remainder is going out on sales.

Coke.—There has been no business whatever in coke during the past week either in small immediate lots or on future contracts. This is due to the fact that meters are covered by supplies in the yard and under contract. There has been no change from the prices quoted at the Connellsville base figure.

Finished Iron and Steel.—In finished products both the mill representatives and the warehousemen continue to live chiefly on hope as the sales show no increase.

WASTE IN INDUSTRY

Report of Committee of American Engineering Council—Findings and Recommendations

St. Louis, June 8.—Waste in industrial processes is causing enormous annual losses to the nation, according to the report of the American Engineering Council's committee on the elimination of waste in industry, made public at a meeting of the council's executive board here to-day. A plan of nation-wide co-operation among government, public, trade associations, industry, labor, bankers and engineers is outlined.

The waste inquiry was in charge of a committee of sixteen headed by J. Parke Channing, New York, as chairman, and L. W. Wallace, Washington, executive secretary of the American Engineering Council of the Federated American Engineering Societies, as vice-chairman. The committee was named last January by Herbert Hoover, then president of the council. The inquiry was carried on by a large force of field workers who obtained first hand information of conditions existing in the leading basic industries, particularly in New York, New England and Pennsylvania. The investigation is the beginning of a movement by the country's organized engineers to bring about better industrial conditions and more harmonious relations between capital and labor. This report, it is stated, is the first work undertaken by the Federated American Engineering Societies in rendering public service. It deals exhaustively with housing and building; ready-made men's clothing; shoes; metal trades, and printing.

Intermittent Employment Large Waste

The wastes of interrupted production are summarized as follows: "The margin of unemployment amounts to more than a million men; cyclical industrial depressions are causes of waste through idle men, plant, equipment and materials. Intermittent employment is not merely the cause of one of the largest wastes in industry, it is also the one big problem for which labor demands a satisfactory solution. Waste results from conflicts between management and labor, but the amount is much less than is popularly supposed. Large inventories of raw materials and finished product and unbalanced production are causes of waste resulting from idle materials. Large sums of money are invested in idle equipment, and over-equipment and factory buildings in many instances are larger than necessary."

In attributing waste to faulty management, the report says: "The average method of management is far behind standards which have demonstrated their practical value; billions of dollars are tied up in idle equipment and there is a large additional waste through maintenance and depreciation charges. Manipulations in raw material result in serious losses, and present sales policies are a contributing cause of irregular production." High labor turnover is given as a rough index of one of the commonest wastes in industry.

As to restricted production, the report says: "Both employer and employees restrict output, the former usually by limiting the total output of an industry, the latter by limiting the rate of speed of output of individual workmen."

Recommendations Offered

The committee's recommendations for the elimination of waste include the following: "A national industrial information service should be established to furnish more timely, regular and complete information covering current production and consumption and stocks of commodities. A national statistical service should be established covering employment requirements and a national policy regarding public health should be fostered and encouraged. The national program for industrial rehabilitation should be encouraged and should offer opportunities for education and placement to those having physical defects as well as those handicapped because of industrial accidents. A nation-wide program of industrial standardization should be encouraged in conjunction with industrial interests, and the government should recognize the necessity for a revision of such federal laws as interfere with stabili-

zation of industry." It is also recommended that a body of principles should be accepted which could be developed for the adjustment and settlement of labor disputes.

After outlining the support and help to be contributed by the public and by trade associations, the report takes up the responsibility of plant management. It declares that administrative policies should cover improvement of organization, administrative and management control; the stabilization of production; introduction of effective employment methods; creation of individual or collective research departments; industrial education; curtailment of practice of adjustments, cancellations and returns where customary; development of purchasing schedules; correlation of sales policies with production and accident prevention.

Modification of Union Rules Urged

Organized labor, it is urged, should co-operate to develop a policy for increasing output. The attitude of opposition or indifference to proper standards for production should be changed and a frank and aggressive insistence on such standards maintained. There should be a scientific examination of the bases for wages and certain union rules should be modified in regard to machine operation, apprentices and craft distinctions which result in restriction of output. Individual workers should realize their responsibilities for waste resulting from ill health and disregard of safety measures.

As to idle material: "The waste of idle material in large inventories of raw and finished materials is very large. Unbalanced production also results in a very large material idleness." Large waste is said to exist through plant idleness. The printing industry is cited as an example where vast sums of money are tied up in unnecessary stock resulting from great duplication of brands of paper. "The present investment of more than a hundred million of dollars in stocks of paper carried on hand to meet trade requirements of the printing industry," it is said, "could be cut in half through standardization."

The report mentions that the average plant in the metal trades group is from 25 to 30 per cent behind the best plant in output per employee, while the building industry is given as about 60 per cent efficient, and the waste in the shoe industry put at about 35 per cent.

The report states that on the whole over 50 per cent of the responsibility for the waste occurring in industrial processes can be placed at the door of management and less than 25 per cent at the door of labor. It is understood there was opposition in the council to the committee report, it being held that the findings of the committee were not definite and concrete enough for public issuance by a body of engineers. The board finally authorized publication of the report, not as one from the American Engineering Council, however, but purely as the findings of a committee.

Discussion on the Report

William McClellan, Philadelphia, a member of the board, representing the American Institute of Electrical Engineers, and F. J. Miller, Bucks County, Pa., representing the American Society of Mechanical Engineers, criticized the report adversely, while L. W. Wallace defended the accuracy of the report. Mr. Miller said that the report gives conclusions without setting out the facts on which the conclusions were based. It charges, he said, inefficiency to large groups of industries in general, whereas it is more than probable that the facts from which the conclusions are drawn apply only to a few individual members of this group. Mr. McClellan said the report did not define the waste alleged nor cite the committee's authority for the charges made.

It was stipulated that the report be sent back to the committee for revision and members of the board are to receive all the information on which the committee based its conclusions and the board members may suggest any changes they may deem desirable to the committee in writing. As soon as completed and approved by the board, the full report will be given out for publication.

COMPETITION FROM FRANCE

Belgian Steel Market Conditions—Strike at Ougree-Marihay

BRUSSELS, BELGIUM, May 16.—The iron and steel market in Belgium has been improving. Most of the plants have their order books filled until the end of June by reason of the English strike. At present 24 blast furnaces are in operation producing 3019 tons of pig iron per day.

The development of the past week was the general strike at Ougree-Marihay works, for a trivial pretext, throwing out about 6000 workers, and resulting in the shutting down of four coal mines whose workers decided to quit as an "act of solidarity." The trouble dates back several months. It was provoked by the ill will of several coke oven workers who work six hours a day.

They refused to clean the ovens as had always been done before, and declared that from that time on they would operate the ovens themselves for their own account. Other workers joined them and the management called upon the gendarmes who put an end to this project. In the conference that followed the management demanded the dismissal of 45 workers for acts of insubordination; then in a spirit of conciliation it reduced the number to eight, then to seven, and finally proposed to make an example of three or four. But the workers insisted on the re-employment of all the

coke oven workers. This the management refused. A complete shutdown was threatened, but the management got a few volunteers to operate the electrical equipment driven by blast furnace gas. Later these men also quit. The company issued a statement saying that the cessation of work would certainly lead to the cancellation of important orders and that it was to be feared these would be turned over to foreign firms, possibly German. As the strike continued numerous acts of violence were reported.

Coke is becoming very abundant in Belgium in view of the cutting down of pig iron production, caused by foreign competition. In May 25,000 tons was sent from Germany to Belgium, augmenting the stocks at the disposition of Belgian consumers. It is certain that if the price of Belgian coke does not go down appreciably, French and Luxemburg competition for finished products will be very serious for Belgium.

Belgian iron and steel manufacturers have taken note of the reduction from 600 to 550 fr. per ton in the price of beams in France which is expected to be followed by a similar reduction in the price of sheets and flats.

The French comptoirs evidently want by these means to get a foothold in outside markets and Belgian steel men are on their guard. Recent quotations have been, per 100 kilos: Merchant iron, export, f.o.b. Antwerp, 46 fr.; ordinary sheets, 60 fr.; merchant bars, 44 fr., interior; export, f.o.b. Antwerp, 46.50 fr.; scrap iron and steel, 12 fr.; ordinary coke, 117 fr.

British Iron and Steel Market

Cleveland Furnaces All Idle—Labor Threatens Further Trouble—Sterling Lower

(By Cable)

LONDON, ENGLAND, June 7.

Labor is threatening trouble on all sides; the coal strike conferences have been renewed, the cotton trade is at a standstill, the engineering trade and the wool trade are holding conferences with the Government regarding wage reductions.

Cessation of Cleveland pig iron production is now complete with the blowing out of the last two furnaces. Number 3 foundry iron is unobtainable and lower grades are unsalable. Official minimum quotations are unaltered. Hematite is practically idle except for a small improvement in export sales, but buyers are generally anticipating lower values. Tees prices are unchanged.

Pig iron exports for May amounted to 10,877 tons. Midland iron workers' wages have been reduced 35 per cent.

Tin plates are in fair demand, stock plates having been sold up to 27s. (\$5.09) basis f.o.b. Only about 7 per cent of the South Wales tin plate capacity is active, due to the fuel shortage. One Japanese order for 13,700 boxes has been reported, of charcoal plates, which are to be filled from stock.

We quote per gross ton except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$3.77 per £1 as follows:

Durham coke	£2 2	\$7.92
Cleveland basic	6 0	22.62
Cleveland No. 1 foundry	6 5	23.56
Cleveland No. 3 foundry	6 0	22.62
Cleveland No. 4 foundry	5 19	22.43
Cleveland No. 4 forge	5 17½	22.15
East Coast mixed	8 0 & 17 10*	30.16 & 28.28
Ferromanganese	18 0 & 17 10*	67.86 & 65.98
Ship plates	16 0 to 19 0	60.32 to 71.63
Boiler plates	24 0 to 25 0	90.48 to 94.25
Tees	15 10 to 18 10	58.44 to 69.75
Channels	14 15 to 17 15	55.61 to 66.92
Beams	14 10 to 17 10	54.67 to 65.98
Round bars, ¾ to 3 in.	15 0 to 16 10	56.55 to 62.21
Rails, 60 lb. and up	13 0 to 15 0	49.01 to 56.55
Billets	11 10 to 12 10	43.36 to 47.13
Sheet and tin plate bars, Welsh	11 0 to 11 10	41.47 to 43.36
Galvanized sheets, 24 g.	22 0 to 22 10	82.84 to 84.83
Black sheets	19 0 to 20 0	71.63 to 75.40
Tin plate base box	1 5 to 1 9	4.71 to 5.47
Steel hoops	17 10 to 20 0	65.98 to 75.40

*Export price.

FAIL TO AGREE

Members of Steering Committees Appeal to Tariff Commission for Assistance

WASHINGTON, June 7.—Unable to agree upon the Longworth resolution making rates in the permanent tariff bill effective from the day of introduction in the House, Republican members of the steering committees of the House and Senate have appealed to the Tariff Commission, which is preparing a stopgap bill which would be along the lines but with modifications of, the Longworth resolution.

The joint conference of House and Senate Republican leaders to-day is accepted as further proof of differences within the Republican party itself over ad interim legislation which is opposed almost solidly by the Democrats and also gives evidence of the accuracy of reports that the Longworth resolution would have to be modified before passage by Congress could be brought about. It is felt by many Republicans in both branches that the Longworth resolution gives too much power to the Ways and Means Committee, which could determine rates that would be made effective from the time the permanent tariff bill is reported to the House. Members of Congress opposing the Longworth resolution but favoring ad interim legislation say both branches should determine rates rather than leaving it to the Ways and Means Committee. The conference reached no agreement but decided to further canvass the tariff situation before committing the Republican party as to ultimate policy.

Cleveland and Kent Companies Will Merge

CLEVELAND, June 7.—The Lamson & Sessions Co., Cleveland, maker of bolts, nuts and other products, and the Falls Rivet Co., Kent, Ohio, maker of bolts, nuts and rivets, will be merged July 1 in a corporation with a capital stock of \$3,000,000, the name of which has not yet been selected. Both of the existing plants will be operated under the new organization. Stockholders of both companies will exchange their holdings for stock in the new company. Roy Smith, president, Falls Rivet Co., will become a vice-president of the new company, and the present officers of the Lamson & Sessions Co. will hold similar positions in the new organization.

INQUIRY FROM FAR EAST

Bridge, Pipe, Plate and Railroad Inquiries—
Demand for Low Price Plate Shearings

NEW YORK, June 7.—While numerous inquiries continue to appear in the market, chiefly from Far Eastern sources, but little business has so far developed, with the exception of some of the larger government inquiries and those from Japanese sources. Export quotations of mills continue weak and generally lower than the domestic schedule. Pipe inquiries from India and the Far East are generally large. One export company through its German connection has received an inquiry on about 20,000 pieces of charcoal-iron locomotive boiler tubes in 17-ft. lengths for shipment to Reval. The order will probably go to German mills. A house dealing with the Far East has been requested to quote on 210,000 ft. of steel gas pipe, ranging in size from $\frac{3}{8}$ in. to 2 in. and evidently being purchased for stock. Another large pipe inquiry being handled by a New York exporter is for a hydroelectric project in the island of Formosa. It specifies six lines of lap weld, steel pipe, 990 ft. long, capable of a 570-lb. pressure per sq. in. and 46, 50 and 54 in. in size.

Japan Inquiries for Bridges

Railroad purchasing continues to hold the lead in Far Eastern markets. In addition to the purchases and inquiries still in the market from Chinese railroads, recently mentioned in THE IRON AGE, the Pekin-Suiyuan Railroad will purchase 5 locomotives and 100 steel cars and the Shanghai-Nanking-Ningpo Railroad will purchase 6 British type locomotives and 100 passenger cars. In pursuance of the recently announced policy in Japan of renewing a large part of the railroad bridges in the vicinity of Tokio, inquiries are now in the market for 9 steel bridges; the two largest involve 1850 tons and 1500 tons of steel and the remainder are of smaller specifications. Quotations as low as 2c. per lb. base are understood to have been received on this material by exporters handling the inquiry.

Black sheets of light gage continue to be purchased in the Japanese market, one exporter during the past two weeks having booked orders for 350 tons. A Chinese inquiry, which is issued through a Chinese bank, calls for about 500 tons of tank plates and representatives in the Far East report a good demand for plate shearings, which are used for the manufacture of knives and small tools. Prospective buyers, however, as a rule refuse to consider present quotations on this material.

An inquiry has been received by the Wonham, Bates & Goode Trading Co., 251 Fourth Avenue, New York, for a continuous rod mill, capable of handling about 500 tons per 44-hr. week of 4 x 4-in., 300-lb. billets and producing Nos. 5 and 6 gage rods to be used in nail making and redrawing for manufacture into wire netting.

New Shanghai Development Company

The Fung Sheng Industrial & Commercial Development Corporation, capitalized at \$2,000,000, of which one-half has been subscribed, is now in operation in Shanghai. The corporation will undertake the development of real estate holdings, industrial plants, mines, storage warehousing and general industrial financing. According to the *North China Herald*, the demand for power plants in China, which was active until the middle of 1920, is showing signs of resumption. German agents have been offering to book orders for electrical and other machinery at low prices for immediate delivery, but experiences with the delivery are reported to have been unsatisfactory.

The German subsidiary of an American export company reports business there generally slack and the few orders, domestic and export, that are being booked are filled without difficulty in Germany. It is reported by the Bureau of Foreign and Domestic Commerce that a German company is considering the establishment of a plant for building railroad cars on the northern coast of Java.

NEW BETHLEHEM SHAPES

Increased Flange and Web Thickness—New
Beam Size and Light H-Columns

Additional mill capacity, recently completed and put in operation for the production of wide flange structural shapes, has led the Bethlehem Steel Co. to add a number of new sections to its present established line of Bethlehem structural shapes.

Three new beam sections are provided, designated as B24b, B22 and B18a. The new 24-in. and 18-in. beams, B24b and B18a, are to supply the need for beams having a greater carrying capacity than the previous line of 24-in. and 18-in. beams afforded. The new 22-in. beams supply sections intermediate in depth between 20 and 24 in., and have been adopted as an economical addition to the range of beam sizes.

The comparison of the new 24-in. and 18-in. Bethlehem beams with standard section beams, is as follows:

	Bethlehem Beams	Section Modulus		Standard Beams	Section Modulus
B24b.	101.5 lb.	246.1	24 in.	112.0 lb.	246.3
	97.5 lb.	234.3		105.9 lb.	234.3
B18a.	71.9 lb.	136.6	18 in.	85.0 lb.	135.6
	69.0 lb.	126.9		76.6 lb.	126.8

The increase in weight of the new beams is obtained by increasing the thickness of the flange as well as that of the web, instead of obtaining the entire addition in weight by increasing the thickness of the web only. This new method, on which patents are pending, permits obtaining an increase in section modulus practically proportional to the added weight. Thus B18a, 74 lb., compared with B18a, 69 lb., has an increase of 9.7 in section modulus, or about $7\frac{1}{2}$ per cent increase in modulus, due to the increase of 5 lb., in weight, which is about $7\frac{1}{2}$ per cent increase in weight also. By the process of manufacture the addition to flange thickness is made to the outside of the flange, thereby slightly increasing the depth of the beam, but the total variation in depth between minimum and maximum is not more than the usual allowable tolerance in depth necessary in any method of rolling beams.

New column sections are provided, supplementing the company's previous list of H columns and affording a line of sections lighter than its regular H columns. These supplementary column sections are to supply lighter columns for many purposes, including shop and mill building construction. A series of 6-in. columns, in various weights, is provided for specially light construction.

The flanges of the new beams have a bevel of 8-13 per cent, or a slope of 1 in 12. Flanges of the column sections have a uniform slope of 2 per cent. All weights include fillets, but areas and all other properties are given exclusive of fillets. Tolerances in weight and section and all other regulations concerning material, lengths, etc., conform to the established rules applying to the regular Bethlehem sections.

To aid in the selection of columns subjected to direct loads and also to bending produced by eccentric loads or by other means, bending factors have been added to tables of the dimensions and properties of the columns, thus to furnish a convenient method of converting the bending moment into an equivalent direct central load.

Railroads Ask Withdrawal of Advance of
July, 1920

CHICAGO, June 7.—A substantial number of railroads which had not filed applications for wage cuts before June 1 have asked the Railroad Labor Board for a complete withdrawal of the 20 per cent wage advance of July, 1920. At the same time, they have asked that extra pay for overtime and uniform wages for the same classes of employees over the entire country be abolished. A referendum ballot has been sent out to 250,000 maintenance of way employees to determine whether they will accept the average 15.6 per cent cut announced by the board last week. Maintenance of way employees suffered a larger reduction than most other classes of railroad employees.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia	\$.035	St. Paul	\$.065
Baltimore	0.335	Omaha	0.815
New York	0.38	Omaha (pipe)	0.77
Boston	0.415	Denver	1.85
Buffalo	0.295	Denver (wire products)	1.415
Cleveland	0.24	Pacific Coast	1.665
Cincinnati	0.325	Pacific Coast, ship plates	1.335
Indianapolis	0.345	Birmingham	0.765
Chicago	0.38	Jacksonville, all rail	0.565
St. Louis	0.475	Jacksonville, rail and	
Kansas City	0.815	Switzerland	0.46
Kansas City (pipe)	0.77	New Orleans	0.515

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver, the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 70c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1; wire fencing, netting and stretcher, \$1; pipe, not over 8 in. in diameter, 85c. over 8 in. in diameter, 2 1/2c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zebs, structural sizes, 2.20c.

Wire Products

Wire nails, \$3 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.50 and shorter than 1 in., \$2; bright Bessemer and basic wire, \$2.75 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.75; galvanized wire, \$3.45; galvanized barbed wire, \$3.85; galvanized fence staples, \$3.85; painted barbed wire, \$3.15; polished fence staples, \$3.15; cement-coated nails, per count keg, \$2.00; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 60 1/2 to 63 per cent off list for carload lots, 55 1/2 to 62 per cent for 1000-rod lots, and 58 1/2 to 61 per cent for small lots, f.o.b. Pittsburgh.

Bolts, Nuts and Rivets

Large structural and ship rivets, \$3.25
Large boiler rivets, 3.35
Small rivets, 60, 10 and 10 per cent off list
Small machine bolts, rolled threads, 60, 10 and 10 per cent off list

Same sizes in cut threads, 60 and 10 per cent off list
Longer and larger sizes of machine bolts, 60 per cent off list
Carriage bolts, 1/4-in. x 6-in., 60, 10 and 10 per cent off list

Smaller and shorter, rolled threads, 60 and 5 per cent off list
Cut threads, 50, 10 and 5 per cent off list
Longer and larger sizes, 50 and 10 per cent off list
Lag bolts, 65 per cent off list

Plow bolts Nos. 1, 2 and 3 head, 50, 10 and 5 per cent off list
Other style heads, 20 per cent extra
Machine bolts, c.p.c. and t. nuts, 1/4-in. x 4-in., 20 per cent extra

Smaller and shorter, 50, 10 and 5 per cent off list
Longer and larger sizes, 50 and 10 per cent off list
Hot pressed sq. or hex. blank nuts, \$1.00 off list
Hot pressed nuts, tapped, \$3.50 off list

C. p. c. and t. sq. or hex. nuts, blank, \$4.00 off list
C. p. c. and t. sq. or hex. nuts, tapped, \$3.50 off list
Semi-finished hex. nuts, 1 to 9/16 in. inclusive U. S. S., 80 and 10 per cent off list

Same sizes S. A. E., 80, 10 and 10 per cent off list
1/2 to 1 in. inclusive U. S. S. and S. A. E., 70, 10 and 10 per cent off list
Stove bolts in packages, 80, 10 and 10 per cent off list

Stove bolts in bulk, 80, 10 and 2 1/2 per cent off list
Tire bolts, 65, 10 and 10 per cent off list
Track bolts, 4.35c base

Square and Hex. Head Cap Screws

1/2 in. and under, 70 per cent off list
9/16 in. to 3/4 in., 70 per cent off list

Set Screws

1/4 in. and under, 70 and 5 to 70 and 10 per cent off list
9/16 in. to 3/4 in., 70 per cent off list

Rivets

Rivets, 1c. per lb. extra for less than 200 kegs. Rivets in 100-lb. kegs, 25c. extra to buyers not under contract; small and miscellaneous lots less than two tons, 25c. extra; less than 100 lb. of a size, or broken kegs, 50c. extra.

All prices carry standard extras f.o.b. Pittsburgh.

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$48; chain rods, \$48; screw stock rods, \$53; rivet and bolt rods and other rods of that character, \$48; high carbon rods, \$53 to \$73, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9/16-in. and larger, \$3.25 to \$3.40 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/4-in., and 7/16-in., \$3.40 base; 5/16-in., \$3.40 base. Flat and large spikes, \$3.40 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, \$4.35 base per 100 lb. Tie plates, \$2.50 per 100 lb.; angle bars, \$2.75 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$12.30 per package; 8-lb. coating, 1 c., \$12.60; 12-lb. coating, 1 c., \$14.30; 16-lb. coating, 1 c., \$15.30; 20-lb. coating, 1 c., \$16.55; 25-lb. coating, 1 c., \$17.80; 30-lb. coating, 1 c., \$18.80; 35-lb. coating, 1 c., \$19.80; 40-lb. coating, 1 c., \$20.80 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars at 2.10c. from mill. Refined bar iron, 2.75c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Steel			Iron		
Inches	Black	Galv.	Inches	Black	Galv.
1/4	50 1/2	24	1/4 to 3/8	27 1/2	28 1/2
3/8 to 1/2	52 1/2	26	1/2	27 1/2	28 1/2

6	13.00	13.00	29.00	4.75	4.50	5.05
7	13.00	13.00				

NEW YORK, June 7.

No change for the better is reported and the markets continue exceedingly inactive. Demand for copper is light and the price tendency is easy. Tin has declined with the fall in exchange but there has been a little better buying. The lead and zinc markets continue flat and prices are lower.

New York

Copper.—There has been almost no business in the past week. The unsettlement in exchange values has affected this market so far as foreign buying is concerned and there has been no incentive for domestic consumers to make purchases, at least on any large scale. An easier tendency is noted in the market but the price of electrolytic copper depends upon the seller. Most of the leading producers will not sell for June delivery at less than 13.50c., delivered, but from some other sources it is conceded that moderate amounts, enough to fill present needs, can be obtained at 13.25c., delivered. We therefore quote the market at 13c., New York, and 13.25c., delivered, for June, with July ¼c. higher and third quarter at 13.75c., delivered. Lake copper is also inactive and quoted largely nominal at 13.25c., delivered. It is stated that the general market is by no means without its favorable feature. A fair amount of metal is going into consumption both here and abroad constantly, and it is stated that it is equal to at least 60 per cent of the pre-war rate. With production at an extremely low ebb the future of the market is not without its encouragement.

Tin.—The principal factor in this market has been the decline in exchange which at present is considerably below the values two weeks ago. This has resulted in lower prices in this market and in London and has been the cause of a moderate amount of buying. Late last Tuesday, May 31, there were a few sales of spot and future tin at 31.50c. and on June 3 there were future shipment sales of June-July at 30.50c. early in the day, with sales at the close of the day at 30.25c. Yesterday there were sales early in the day at 29.75c. and 29.50c. and at the close as low as 29.25c. The total that changed hands amounted to 100 to 150 tons, mostly future shipment and largely taken by dealers. To-day sales of about 200 tons were made down to 29c. The feature in spot tin is that this position is closely held, and therefore hard to secure. The quotation for this position to-day was 29c., New York, for spot Straits. London quotations to-day were from £8 to £12 lower than a week ago with spot standard at £165 15s., future standard at £167 and spot Straits at £166 15s. Deliveries of tin into consumption for the month of May were 1225 tons with the quantity afloat and landing on May 31 at 2571 tons. Total imports for the five months of this year were 7353 tons, as compared with 23,013 tons to June 1, 1920. Arrivals thus far this month have been 505 tons with 2150 tons reported afloat.

Lead.—The only feature of interest in this market was the reduction late Monday of the quotation of the leading interest from 5c. to 4.75c., both New York and St. Louis. Very little business is reported by either the leading interest or the outside market. The market for some time has experienced the pressing of speculative lots at St. Louis until the outside market has reached 4.60c., St. Louis, which was probably the cause

of the step taken by the leading interest. We quote the market largely nominal at 4.50c., St. Louis, or 4.75c., New York.

Zinc.—The market is absolutely flat with business confined to carload lots for early shipment and very few of these changing hands. Prime Western for early shipment is quoted at 4.55c., St. Louis, or 5.05c., New York, at which level a few lots have changed hands. It is possible that this could be shaded to 4.50c., St. Louis, on a fairly desirable tonnage for prompt shipment.

Antimony.—Wholesale lots for early delivery are quoted at 5.20c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in wholesale lots for early delivery is quoted by the leading producer at 2½c. f.o.b. plant, with the foreign metal of the same grade available from other sellers at 23c. to 23.50c., New York.

Old Metals.—The market is quiet and business is hard to put through. Dealers' selling prices are nominally as follows:

	Cents Per lb.
Copper, heavy and crucible	12.50
Copper, heavy and wire	11.75
Copper, light and bottoms	9.75
Heavy machine composition	12.00
Brass, heavy	8.00
Brass, light	6.00
No. 1 red brass or composition turnings	9.50
No. 1 yellow red brass turnings	6.00
Lead, heavy	4.50
Lead, tea	3.50
Zinc	3.50

Chicago

June 7.—Lack of consuming demand has resulted in further weakness in tin, lead and zinc. Producers and dealers find that they must cut prices to secure any business at all. Old metal prices are unchanged except for reductions in tinfoil and block tin. We quote Lake copper at 13.50c. in carload lots; tin, 31c.; lead, 4.70c.; spelter, 4.70c.; antimony, 7.50c. On old metals we quote copper wires, crucible shapes, 8.25c.; copper cl.ps, 8c.; copper bottoms, 7c.; red brass, 7c.; yellow brass, 5c.; lead pipe, 2.75c.; zinc, 2c.; pewter, No. 1, 17c.; tinfoil, 18c.; block tin, 21c., all these being buying prices for less than carload lots.

St. Louis

June 7.—The non-ferrous markets continue dull and with very little change in quotations. On car lots the prices asked are: Lead, 4.65c.; spelter, 4.75c. On less than car lots the prices asked are: Lead, 5.25c.; spelter, 5.50c.; tin, 34c.; copper, 14c.; antimony, 7.50c. In the Joplin district ore prices show no accretion of strength and lead, basis 80 per cent, sold at \$55 per ton, while zinc blende sold at \$22.50 per ton, basis 60 per cent. There is still no offering of calamine as the prices available do not warrant working the deposits. On miscellaneous scrap metals we quote dealers' buying prices as follows: Light brass, 4.50c.; heavy yellow brass, 7.50c.; heavy red brass, heavy copper and copper wire, 9c.; light copper, 8c.; pewter, 15c.; tinfoil, 18c.; zinc, 3c.; lead, 3.50c.; tea lead, 2c.; aluminum, 9c.

Standard Underground Cable Co. Will Build Plant in St. Louis

The Standard Underground Cable Co. of Pittsburgh, has purchased 600,000 square feet of ground in the north-western industrial district of St. Louis, and will begin the erection of a manufacturing plant there before the end of this year, according to an announcement of the St. Louis Chamber of Commerce. The property is bounded by Kingshighway and Slevin, Geraldine and Brown avenues. It is stated that the expenditure for the St. Louis plant will be between \$2,000,000 and \$3,000,000.

Jordan W. Marsh, president of the company, said that the St. Louis plant will include departments for the drawing of copper wire and manufacture of weather-proof wire, magnet wire and lead covered cable.

GERMAN TREND DOWNWARD

Heavy Stocks Carried by Mills—Sheets Active in Southern Markets

(Special Correspondence)

BERLIN, GERMANY, May 17.—There is scarcely any change in the tone of the market. A slight rally took place when it was doubtful whether Germany would sign the ultimatum presented by the Entente. Prices stiffened for a few days, but gave way again as soon as any existing doubts were removed and the downward trend continues. The pig iron market was dull but for the business done in Luxemburg foundry iron No. 3 which was at first offered at 1050 m. per ton, and has been quoted in francs only during the last days of the past week. Prices ranged between 220 fr. and 240 fr., f.o.b. maker's works.

The rolled material market was also rather quiet except for some activity in warehouse stocks for immediate delivery. For these, comparatively fair prices were obtained. Angles fetched 2200 m. (\$34.32) per ton, flats 2450 to 2550 m. (\$38.22 to \$39.78). Prices for bar iron showed a tendency to fluctuate. The highest quotation heard was 2100 m. (\$32.76), but on the average prices were in the neighborhood of 1850 m. (\$28.86). Spot stocks were obtainable at 2300 m. (\$35.88), while Rhenish-Westphalian mills have already cut the 1800 marks level and are now quoting 1750 to 1700 m. (\$27.30 to \$26.52) per ton.

Luxemburg mills are following suit and are now quoting 290 to 300 fr. (\$23.78 to \$24.60) per ton. Practically the same prices hold true for section iron.

FRENCH OUTLOOK IMPROVES

Prospect of German Indemnity Payment Brightens Market—Coke Declines—Wage Cutting Continues

(Special Correspondence)

LONGWY, FRANCE, May 14.—The position in Meurthe et Moselle and in Lorraine looks brighter as a result of the prospect of German payment of the indemnity. The Germans have placed in Amsterdam large sums in dollars and sterling, to be converted into French and Belgian francs. This is considered as a proof that Germany is resolved to pay.

There is a scarcity in orders for heavy bars and squares and rounds 2½ in. and larger. Various rolling mills are quoting widely diverse prices. The base price seems to be 44.50 to 45.50 fr. per 100 kg.

Further changes are expected in the near future, as the price of coke will probably be about 95 to 97 fr. per 1000 kilos during the next few months, and the new terms on fuel will doubtless influence the tone of the market in France.

No. 3 pig iron (rough skin) is quoted at 255 fr. per ton and evidently a price of 248 to 250 fr. per ton will be reached this summer in sympathy with a further decline in the prices of fuel. Stocks of pig iron are still considerable and but for the strike in England the depression in Belgium would have reached its climax.

The stock of domestic machine tools is still enormous. A pool has been formed by the French Government to provide the devastated sections with machinery equipment. The warehouses of this official pool are filled with German machine tools and difficulty is being experienced in disposing of the machinery, as with the rise of the franc the preference here is for American machinery.

Dullness prevails among the foundries. American methods and machinery are being adopted with a view to saving labor costs, which are high. Castings for engineering purposes may be had at 125 to 155 fr. per 100 kg., depending upon specifications. Railroad castings range from 100 to 120 fr. per 100 kilos, f.o.b. trucks.

French steel works contemplate the manufacture of thin sheets on a large scale. Three-sixteenth-inch sheets

Hoop iron started with 2700 m. (\$42.12), but soon dropped to 2250 m. (\$35.10) per ton. Structural material met with light demand, only the heavier shapes coming in for some inquiries. We quote channels at 2150 m. (\$33.54), tees at 2500 m. (\$39.00). A light business in rounds, bright, was done with prices for ¾-in. to 9/16-in. bars averaging 3200 m. (\$49.92) per ton. The wire market remained unchanged; we quote rolled material at 1600 m. (\$24.96) for domestic delivery, while export stocks are offered at 1800 m. (\$28.08) f.o.b. German port. For open hearth stocks, 60 m. more per ton is charged. Judging by the reports on hand, considerable stocks are still being carried both by mills and warehouses. We quote the following for railroad material: Heavy rails 2300 m. (\$35.88), inclusive, fish plates 2350 m. (\$36.66), heavy ties 1700 m. (\$26.52), light ties 1600 m. (\$24.96), stay plates 1750 m. (\$27.30). Blooms, open hearth, are quoted at 1300 m. (\$20.28) per ton f.o.b. maker's mill.

A slightly increased activity in sheets has been noticeable, especially in the South German markets. Heavy sheets are quoted at 2350 to 2450 m. (\$36.66 to \$38.22), medium sheets at 2550 to 2650 m. (\$39.78 to \$41.34), and thin plates at 2750 m. (\$42.90). Quotations by Rhenish-Westphalian mills ranged within 2200 and 2100 m. (\$34.32 to \$32.76), one inquiry even limiting the price for light sheets to 1900 m. (\$29.54), which met, however, with a refusal. Tin plate was quoted in the Southern markets at 4100 m. per ton, 205 m. per 100-lb. box (\$3.20).

Business in the pipe and tube market was unsatisfactory. We quote cast iron flanged pipes at 300 m. per 100 kg. (2.12c. per lb.) and seamless boiler tubes 2½ in. x 2¼ in. at 6.50 m. per metre (3.08c. per ft.).

are being offered at 68 to 72 fr. per 100 kg., f.o.b. mill. Heavy plates are weaker.

Several works in Lorraine have been forced to curtail output and stop pig-iron production. In other districts, however, furnaces have been blown in.

Wage cutting continues. The decline in wages is from 1.25 to 3 fr. per day. Idle men are not numerous, as many are settling down to domestic work, agriculture etc. Official statistics, however, show thousands of idle men.

Suit Against American Can Co. Is Abandoned

WASHINGTON, June 7.—The Government's case against the American Can Co., which was charged with being a monopoly in violation of the Sherman law, has been abandoned. On motion of Solicitor General Friereson, of the Department of Justice, the Supreme Court yesterday dismissed the Government's appeal from decrees of lower courts, which held the American Can Co. is not a monopoly.

The Supreme Court, before adjourning until Oct. 3, assigned several important cases for reargument, including the one against the United Shoe Machinery Co., charged with violation of the anti-trust law.

Fire at Plant of McKeesport Tin Plate Co.

Fire at the plant of the McKeesport Tin Plate Co., McKeesport, Pa., the night of June 6, destroyed the storehouse, stock house and shipping room. With the exception, however, of a few of the tin pots which the company had not used this year, the producing plant was not touched and officials of the company are advising customers that a resumption of operations will be possible in a few days after the debris is cleared away. As a matter of fact, several mills remained in operation during the early part of the fire and it would be possible to start up at once if it were not for the fact that there is no place to put the product. No reliable estimate yet is available as to damage sustained, but it is chiefly in finished material and in the building which housed the storage, stock and shipping departments.

PERSONAL

Charles V. Haynes, Philadelphia, gave an address on vapor heating systems before the Massachusetts chapter, American Society of Heating & Ventilating Engineers at the Engineers Club, Boston, June 2. The address included an historical sketch as well as the present application and future possibilities of the system.

Hjalmar E. Skougor, consulting industrial engineer, 150 Nassau Street, New York, has returned to New York from Europe after an absence of three months.

William J. Grose, for a number of years in the purchasing department of the Carnegie Steel Co., Pittsburgh, resigned recently to accept a position of bond salesman with Wells, Singer & Dean, Union Arcade, Pittsburgh.

W. H. Bleecker, Jr., formerly district sales manager at the Chicago office of the Page Steel & Wire Co., will be transferred to the New York office in the same capacity. E. J. Flood has been appointed district sales manager for all Page products at the Chicago office, 208 South La Salle Street, succeeding W. H. Bleecker, Jr.

L. A. Lambing has been appointed superintendent of the open-hearth department, Pittsburgh Crucible Steel Co., Midland, Pa. Mr. Lambing, who succeeded Edward F. McGeehan, formerly was assistant superintendent of No. 4 open-hearth department of the Homestead works, Carnegie Steel Co. He is a graduate of the University of Pittsburgh.

Prof. Warren J. Mead of the department of geology, University of Wisconsin, Madison, departed May 30 for Manchuria as one of a party of six experts commissioned to make a geological and engineering survey of iron ore and coal deposits along the South Manchuria Railway. The experts will return about Sept. 15. Professor Mead has been assigned to work particularly on iron ore exploration. The deposits found in the section which the railroad is having surveyed by the American commission are said to be very similar to the iron ore found in the Lake Superior region of Minnesota, Wisconsin and Michigan, in which district Professor Mead has had wide experience in exploration. Accompanying him are: Prof. W. R. Appleby, dean School of Mines, University of Minnesota; W. R. Emmons, state geologist of Minnesota; L. D. Davenport, Boston; W. H. Craig and Frank Hutchinson, Duluth, Minn.

Oskar Kylin was recently appointed general sales manager of the Foster Machine Co., Elkhart, Ind. Mr. Kylin, who for the last five years has been chief engineer and a member of the executive board of the company, still retains his former position in addition to his new duties.

Charles D. Terry, assistant to the general superintendent of the National Tube Co., sailed on the Olympic, June 4, for a tour in Europe, including France, Switzerland, England and Scotland. He is accompanied by Mrs. Terry. As a member of the committee of the American Society of Mechanical Engineers on threading practices Mr. Terry went abroad in 1919 to confer with French and English representatives on an international threading standard for pipe fittings, valves, etc.

Charles Piez, president Link-Belt Co., Chicago, and nationally known as director-general of the United States Shipping Board, Emergency Fleet Corporation, addressed the Engineering Advertisers' Association of Chicago on June 7 at the Great Northern Hotel, Chicago, on "Advertising and Selling from an Executive's Viewpoint."

Several important changes in the sales department of the Midvale Steel & Ordnance Co., Philadelphia, were put into effect Monday, June 6. About two years ago, the general sales department was split into five divisions, each having its own manager, with John C. Neale, vice-president, in charge as general manager of sales. These five divisions are now consolidated into

three divisions. Alfred C. Howell, who was in charge of the structural division, which took in plates, shapes and charcoal iron boiler tubes, becomes district sales agent in Philadelphia, succeeding Frank J. Krouse, who has been appointed assistant manager of the bar and billet division. Ward A. Miller, who was in charge of the distributors' division, which took in wire products and tool steel, has been appointed district sales agent in Chicago, succeeding the late Clifford J. Ellis. J. C. C. Holding becomes manager of the structural division, with L. S. Thomson as his assistant. L. R. Steuer remains as manager of the bar and billet division, with Frank J. Krouse as his assistant, and Stuart Hazlewood continues as manager of the forging division, with P. S. Rattle as his assistant. The structural division will handle sales of plates, shapes, tubes, cars, standard rails, splice bars and tie plates. The bar and billet division will handle sales of bars, wire products, billets, sheet bars and light rails, and will also handle all jobbing and export trade. The forging division will include, in addition to forgings, tires, gear blanks, wheels, axles and tool steel.

Stephen Badlam has severed his connection as sales engineer with the Philadelphia Roll & Machine Co., Philadelphia, and has engaged in business as an engineer, specializing in rolling mill equipment, with offices at 1019-1021 North American Building, Philadelphia. Prior to his connection with the Philadelphia Roll & Machine Co., Mr. Badlam was 12 years with the Pennsylvania Steel Co. in the operating department, and assistant chief engineer of the Pittsburgh Crucible Steel Co. during the building of its Midland plant, and also chief engineer of the Pittsburgh Seamless Tube Co. In the World War he was major of infantry on the General Staff, First Army, and was overseas for two years.

OBITUARY

W. A. JONES, president W. A. Jones Foundry & Machine Co., Chicago, died May 30, at his home in Laporte, Ind., of heart disease after having been in ill health for several years. He was 71 years of age. Before becoming established in Chicago, Mr. Jones was for several years in business at Marseilles, Ill. In Chicago he was connected with the Link-Belt Co. until 1890, when he founded the W. A. Jones Foundry & Machine Co. He specialized in the manufacture of pulleys and transmission machinery, doing general jobbing work also. He was president of the American Foundrymen's Association in 1901 when the first Chicago convention of that organization was held. His only son, Warren G. Jones, vice-president of the company, has conducted the business since his retirement several years ago.

ALEXANDER H. HANDLAN, president Handlan-Buck Mfg. Co., St. Louis, manufacturer of railroad supplies, died May 28 at his summer home in Oconomowoc, Wis., from heart disease after an illness of more than a year. He was 77 years old, and retired from active participation in the company's affairs about 20 years ago. Mr. Handlan began his career 52 years ago as a bookkeeper for M. M. Buck, a small dealer in railroad lanterns. He bought an interest in the business shortly afterwards, and finally bought out Mr. Buck. In 1901 he changed the name of the concern to its present form.

MICHAEL E. CONRAN, president M. E. Conran Co., Brooklyn, pipe and fittings, died May 25.

WILLIAM ARCHIE KYTE, sales manager and member of the board of governors of the Foster Machine Co., Elkhart, Ind., died May 24 at his home in that city. He was born at Middlebury, Ind., on March 1, 1878, and his association with the Foster Machine Co. started in 1905. Death was caused by nervous exhaustion and heart trouble after an illness dating from last January.

FRANK L. FERNALD, naval constructor, U. S. N., retired, died at his home at Eliot, Me., May 29, in his eighty-fifth year. He was the designer of the battleship Maine, which was destroyed in Havana Harbor.

IRON AND INDUSTRIAL STOCKS

General Trend of Security Values Has Continued Downward

Although assurances were given the country has passed through the worst of a financial strain, little industrially transpired the past week to inspire investment confidence. The general tendency of security values has continued downward. Although plans for Federal Reserve System banks to reduce rates during the summer were recently made public, money rates are high. In fact, it is difficult for many concerns to earn the interest, after fixed charges, on borrowed capital at present rate of production. This fact, coupled with heavy shrinkages in inventories, possibly explains the recent passing of dividends in many instances. Throwing over of non-dividend paying stocks has accelerated the general downward tendency of securities.

The reduction of 12 per cent in railroad labor wages, effective July 1, may be followed by a cut in transportation charges, consequently some investors figure the ultimate net gain for the carriers will be unimportant unless tonnages hauled increase to a greater extent than currently reported. No immediate supply and equipment purchases by the railroads appear likely and lower prices for railroad and equipment stocks have resulted. The demand for steel products, pig iron and coke likewise has encouraged comparatively little investment in producing company stocks. On the other hand, the lack of selling pressure is noteworthy. Automobile stocks have been sold the past week on further cuts in prices for machines. At the moment the textile industries are our brightest spots, although grain and cotton markets are responding to better statistical reports.

The range of prices on active iron and industrial stocks from Saturday of last week to Monday of this week was as follows:

Allis-Chalm. com.	31 1/4 - 34 1/4	Lackawanna Steel.	45 1/2 - 48 1/4

Selling Industrial Stocks

YOUNGSTOWN, OHIO, June 7.—Owing to the financial needs of certain holders, selling is developing in preferred stocks of industrial interests. Omission or reduction of common dividend rates has or will materially affect many incomes with the result that cash is being realized in the sale of holdings. This situation, as well as the general slump which has overtaken the industry, has resulted in weakening some of the standard issues.

Commons have naturally declined in sympathy with the general business situation. On about 400 shares, common stock of the Brier Hill Steel Co. sold down to \$17, which is equivalent to \$102 for the old stock before the financial reorganization last year. This price represents a decline of \$133 from the peak of this issue.

Youngstown Sheet & Tube Co. common is selling at \$58, equivalent to \$252 for the original common before the July, 1920, stock dividend, a decline of \$125 per share.

Trumbull Steel Co. common has sold down to \$19.75, which is equivalent to \$98.75, or down about \$75 from the high price.

United Engineering & Foundry common is sought at \$177, the last sale price, and is offered at \$183.

The St. Louis Coke & Chemical Co. has completed arrangements for financing of approximately \$2,000,000 to take care of current liabilities. The National Enameling & Stamping Co. has a substantial interest in this concern.

The G. A. Ball Bearing Mfg. Co., 3051 West Lake Street, Chicago, has increased its capital stock from \$75,000 to \$200,000.

Sale of the property of The Immel Co., Columbus Ohio, automobile body manufacturers, has been ordered by the common pleas court on the application of R. H. Schryver, receiver for the company. The property is held at approximately \$250,000.

Industrial Finances

The Wisconsin Gear & Axle Co., Milwaukee, has increased its capital stock from \$100,000 to \$250,000, consisting of \$50,000 of preferred and \$200,000 of common shares. The concern manufactures axles and gears for the automotive industries. The plant and offices are situated at State Street and Hawley Road.

The Zenith Furnace Co., Duluth, Minn., has filed an amendment to its corporate articles in Wisconsin providing for an increase in capital stock from \$1,500,000 to \$3,000,000. W. B. Castle, Duluth, is president.

The Milwaukee Rolling Mill Co., Milwaukee, which recently placed in operation a new sheet mill representing an investment of about \$1,750,000 at Forty-third Avenue and Grant Street, in West Milwaukee, has increased its capital stock by a new issue of \$1,500,000 of preferred shares, making the total \$3,000,000, in addition to 15,000 shares of common stock having no par value. The new preferred shares will not be issued immediately, according to officers of the company, but will be available when future expansion makes it necessary. The company operates the only sheet mill in the Milwaukee district and is producing blue, black galvanized and annealed sheets. The capacity is 60,000 tons annually. B. B. Jack is general superintendent.

The A. L. Smith Iron Works, Chelsea, Mass., has increased its capitalization \$150,000 by an issue of 1500 shares of first preferred stock, par \$100. Arthur L. Smith is president and treasurer.

The Millers Falls Co., Millers Falls, Mass., tools, has increased its capitalization \$165,200 by an issue of 1652 shares of preferred stock, par \$100, against stock and securities. Philip Rogers is president and George W. Nims, treasurer.

A public offering of \$4,000,000 Interstate Iron & Steel Co., Chicago, 8 per cent first mortgage 20-year sinking fund, series A, bonds, dated May 1, has been made. They are a part of an authorized issue of \$10,000,000 bonds, and are a direct first mortgage in all fixed property of the company.

Penn Seaboard Steel Corporation voting trust certificate holders are offered the opportunity to extend until June 26, 1926, the voting trust agreement which expires June 26, 1926.

The combined profit and loss account of constituent companies of the British Empire Steel Corporation, Ltd., for the year ended Dec. 31, as filed with the New York Stock Exchange, showed a profit, after Government war taxes, interest, depreciation and all other expenses, of \$6,235,127. Sales and other revenues amounted to \$69,681,342 and cost of sales, etc., \$58,865,096. Cash showed \$1,261,884, notes receivable \$429,171, accounts receivable \$12,160,127, and inventories \$18,480,185.

Bankrupt Company Busy

The John Obenberger Forge Co., Milwaukee, which is passing through bankruptcy proceedings, is increasing its operating schedule under permission granted recently to the trustee, John F. Gordis to re-open the works. To finance production, the United States District Court has authorized the trustees to borrow \$60,000 from the First Wisconsin National Bank of Milwaukee, which is the largest creditor. The loan was approved by trustee John F. Harper. It bears 7 1/2 per cent interest and is secured by certificates issued by the trustee. The Obenberger company has orders from the Nash, Packard, Dodge and other automobile manufacturing companies which require prompt delivery. Much of the business on the books represents reinstatement in part of large orders which were cancelled about eight months ago, as the direct result of which the Obenberger company was forced into the bankruptcy court.

Office Changes

General offices of the Eastern Fuel Co. and the Georges Creek Coal Mining Co. have been removed to rooms 404 to 410 Frick Building, Pittsburgh.

Laughlin & Barney, machinery and machine tools, Pittsburgh, have removed from the Wabash Building to the Union Arcade.

The U. T. Hungerford Brass & Copper Co., 180 Lafayette Street, New York, has organized a metal specialties department, which will handle all turned, spun, cast and drawn work, for which the company has manufacturing facilities. The new department will act in an advisory capacity to the branch offices in Boston, Baltimore, Philadelphia and San Francisco.

The John C. Brill Co., sales representative for iron and steel products, New Orleans, has been appointed district sales representative for Oklahoma, Arkansas, Texas and the balance of this Southwestern territory for the LaSalle Steel Co., Chicago, manufacturer of shafting.

Machinery Markets and News of the Works

MAY BUSINESS SLOW

First Week of June Brings No Improvement in Machine Tools

Aside from Probable Railroad Purchases in Chicago the Markets Are Lacking in Prospects

May was a poor month for machine tool builders and their selling representatives. In some instances the volume of sales for May showed a decline from April, nor has the first week of June brought anything encouraging, although in a few quarters inquiries are reported slightly better. The difficulty in closing orders, however, is one of the outstanding features in all sections of the country.

New York

NEW YORK, June 7.

The past week brought no change in the machine-tool situation. Domestic demand for tools is confined to single machines, as has been the case for some months. No important business has developed from recent export inquiries. It is estimated that local dealers are doing about 20 or 25 per cent of what may be considered a normal business.

The crane market is extremely flat, practically no new inquiries having appeared in this district and few sales being reported. The Commissioner of Docks, New York, has issued an inquiry for four 2-ton electric winches for the East Fifth Street Pier. This is part of the 72 winches which will be purchased later. The Shepard Electric Crane & Hoist Co. has sold a 10-ton, 65-ft. span overhead traveling crane to the Pidgeon-Thomas Iron Co., Memphis, Tenn.; Wenhams, Bates & Goode Trading Co. has sold the United Electric Light & Power Co. a 12-ton, 50-ft. boom crawl tread Orton & Steinbrenner locomotive crane, and the American Gas & Electric Co., 30 Church Street, New York, has purchased a used 25-ton Orton & Steinbrenner locomotive crane from the Simmons Machine Co., Albany, N. Y.

The Burns Brothers Coal Co., 50 Church Street, New York, has filed plans for a one-story, brick machine shop, 100 x 120 ft., at 442-48 107th Street, to cost about \$22,000.

The Autoflong Corporation, New York, has been incorporated with a capital of \$50,000 by W. W. Brown, J. T. Wilson and E. A. Kittel, to manufacture brake mechanisms for automobiles and other automotive equipment. It is represented by Leubuscher & Suling, 258 Broadway.

The Never Fall Products Corporation, New York, has been incorporated with a capital of \$110,000 by W. O. Rogers, Jr., J. H. Ballantine and G. R. Prudon, to manufacture electric, gas and water measuring and controlling devices. George A. Gregg, Bridge Plaza North, Long Island City, represents the company.

The Rockland Light & Power Co., Nyack, N. Y., is planning the erection of an addition to its power plant, estimated to cost about \$435,000, including new steam and electric equipment. Application has been made to the Public Service Commission for permission to issue bonds for \$500,000 to defray the cost.

The Halperg-Wein Co., 110 West Fortieth Street, New York, will purchase a quantity of equipment, including machine tools, for use at railroad and car shops in Sweden.

The Greene Avenue Garage, Inc., Greene Avenue, near Classon Avenue, Brooklyn, is having plans prepared for the erection of a one-story service and repair works addition, 50 x 200 ft., estimated to cost about \$20,000, exclusive of equipment. John J. Carroll, 225 Greene Avenue, is architect.

The Essential Automotive Products Co., New York, has been incorporated with a capital of \$120,000 by L. Liebling, H. S. Benedict and R. R. Hill, to manufacture automobile devices and equipment. It is represented by L. Backner, Malden Lane.

Aside from probable purchases by the Illinois Central and Rock Island railroads at Chicago, there is nothing in the way of immediate prospects of importance in any of the markets.

A sizable order for power hammers received by a Cincinnati dealer from a West Virginia company stands out in that market as a leading transaction.

Another slump in the automobile industry has set in, and there is no hope entertained for business from that source during the summer, at least.

In the railroad field the announcement of a wage reduction effective July 1 has brought no hint of probable railroad buying with the exception of a few inquiries for car repairs, principally from the Illinois Central, Missouri Pacific and Wabash.

The Luckenbach Steamship Co., 44 Whitehall Street, New York, will take bids up to June 15 for the construction of the first unit of its new freight terminal at Bull's Ferry, Edgewater, N. J., to cost \$10,000,000 with equipment.

The New York State Gas & Electric Corporation, Ithaca, N. Y., H. C. Hopson, 61 Broadway, New York, representative, has made application to the Public Service Commission for permission to build a new power plant at Plymouth, Chenango County.

The Samaron Sheet Metal Works, Inc., New York, has been incorporated with a capital of \$30,000 by A. Sommerfeld, P. Rosenberg and I. S. Mathew, to manufacture metal goods. It is represented by M. C. Levine, 119 Nassau Street.

The Wire Grip Sanitary Brush Corporation, New York, has been incorporated with a capital of \$50,000 by A. A. Meyerhoff, W. and M. Hertzberg, to manufacture wire brushes. L. Applehome, 302 Broadway, represents the company.

The Stanton Plating & Polishing Co., New York, has been organized by A. O. Jacobson and N. Elkin, 27 Graham Avenue, Brooklyn, to manufacture metal goods.

The Pierce Oil Corporation, 25 Broad Street, New York, is planning for a bond issue of \$12,000,000 for extensions in refineries, operations, etc.

The Master Piston Ring Corporation, New York, has been incorporated with a capital of \$50,000 by B. Hursch, J. I. Polstein and S. S. Budlong, to manufacture piston rings for automobile engines, and kindred automotive products. It is represented by Sanders, Zelenko & Polstein, 217 Broadway.

The Kortum Buff Co., New York, has been organized by K. A. Kortum and C. Brandt, Jr., 99 Nassau Street, to manufacture electro-plating equipment.

The Millville Pulp & Pine Products Co., Millville, N. J., is completing plans for its new one and two-story plant at Millville and Cumberland roads, estimated to cost in excess of \$75,000 with machinery. J. W. Arthur, Old Opera House Building, Millville, is architect. E. H. Hufts, 218-20 Walnut Street, Philadelphia, Pa., is president.

A new one-story power house will be erected at the plant of the Rogers-Pyatt Shellac Co., 39 Essex Street, Jersey City, N. J.

The South Jersey Iron Foundry, Inc., Pleasantville, N. J., has been organized to manufacture iron and steel castings. A local plant will be established. Wray C. Arnold, Commonwealth Building, Philadelphia, represents the company.

The Standard Underground Cable Co., Washington Street, Perth Amboy, N. J., has plans under way for extensions and improvements in its plant to cost in excess of \$200,000. The work will include the erection of several floor additions to present buildings and will aggregate about 100,000 sq. ft. of space for manufacturing operations. Upon completion it is proposed to increase the working force about 25 per cent, making a total of about 1800 operatives. C. C. Baldwin is vice-president and general manager.

The Board of Water Commissioners, Perth Amboy, N. J., has awarded a contract to Greisen & Thompson, Perth

Amboy, for a one-story machine and repair shop on King Street, for department service, at a cost of \$22,460.

The Board of Chosen Freeholders, Passaic, N. J., has awarded contract to Giordano & McGinnis, 415 Highland Avenue, Lodi, N. J., for a two-story automobile service and repair building, 50 x 100 ft., on Marshall Street, to cost about \$50,000.

The New Jersey Blower & Mfg. Co., East Orange, N. J., has been incorporated with a capital of \$50,000 to manufacture mechanical fans, blowers, etc. Charles O. Geyer, 525 Main Street, represents the company.

L. A. Myers, Jr., Inc., 139-45 Ogden Street, Newark, N. J., manufacturer of metal products, has acquired property adjoining its plant at 138-44 Mount Pleasant Avenue, 100 x 100 ft., for extensions.

The Lauder & Shean Device Mfg. Co., Newark, has been incorporated with a capital of \$500,000 by Frederick E. Lauder, Peter A. Shean and Otto Schunck, 810 Broad Street, to manufacture metal specialties.

The American Welding Co., 24 West Kinney Street, Newark, has filed notice of organization to operate a welding, brazing and metal cutting plant. Maurice Rehrlich heads the company.

The New Jersey Commercial Body Co., Burlington, N. J., manufacturer of automobile bodies, has acquired the one-story and basement building at 237-43 Elizabeth Avenue, Newark, on a site 140 x 150 ft., for the establishment of a new plant. Possession will be taken about June 15. The company is headed by S. A. Neidich, Burlington.

The Climax Rubber Co. of New Jersey, 1207 Firemen's Building, Newark, has been incorporated with a capital of \$1,000,000 by J. Phillips Tarr, William J. Gilberts and Warner S. Rexford, to manufacture rubber products.

Edward D. Holly, Newark, and associates have organized a company to manufacture pipe, fittings and other plumbers' supplies and have acquired the factory at Dawson and South streets, 100 x 100 ft. The different buildings on the site will be remodeled and improved and machinery installed for manufacture. Possession will be taken at once. Others interested in the company include Joseph A. Thomson and A. W. Mayer.

The Sanitary Safety Caster Co., Newark, has been incorporated with a capital of \$100,000 by Emil Chalusa, Fred Bien and George A. Schulte, 24 Scott Street, to manufacture casters and kindred metal products.

The Newark Die Co., Newark, has been incorporated with a capital of \$50,000 by Leonard G. Alersook, John Hold and H. H. Kunzelman, to manufacture dies, molds and similar products. It is represented by Peck, Davis & Gray, 810 Broad Street.

The Diamond Bracket Co., 457 Eighteenth Avenue, Newark, has filed notice of organization to manufacture metal shade and curtain brackets and kindred products. Elmer J. Poorman, 327 South Sixth Street, heads the company.

The Bock Machine & Garage Co., 160-66 Main Street, East Orange, N. J., has filed plans for an addition to its works, to provide an aggregate floor space of about 25,000 sq. ft. J. L. Bock is head.

Chicago

CHICAGO, June 6.

Outside of probable purchases by the Illinois Central and the Rock Island railroads, there is little prospective machine-tool business. Not only the larger industrial companies, but even the small shops which have been responsible for most of the buying of late, are no longer showing any interest in new equipment. Sales totals for May indicate a decline from the April figures, and leaders report that the first week in June brought in practically no new business. Although railroad lists have been issued repeatedly without resulting in orders of consequence, the trade is looking with hope in that direction. The Illinois Central is expected to take action on its extensive inquiry within the next fortnight, while the Rock Island will probably buy during the current week against the small list published in this column on May 26. While it is true that the railroads have been reducing their shop forces and in some cases have closed their shops entirely, it is felt that this is a temporary expedient dictated by a desire to postpone work until the reduced wages go into effect. That the carriers are again taking steps to rehabilitate their rolling stock is indicated by the fact that the Illinois Central, the Missouri Pacific and the Wabash have sent out inquiries for figures on the repair of several thousand freight cars. Notwithstanding the fact that railroad traffic is light and there are sufficient serviceable cars to handle current business, sidetracks are so crowded with bad order equipment that they interfere with the operation of trains. On one line between Chicago

and Milwaukee it is reported that every siding is full of bad order cars.

There is very little industrial plant construction in this territory and in Chicago the lockout of the building trades has brought all building to a halt. During May permits were issued in this city for 428 buildings, involving a cost of \$2,967,750, which is by far the lowest amount represented by permits issued in that month in 10 years.

The H. McFarlane Co., manufacturer of automobile bodies, 532 South Canal Street, Chicago, has purchased a tract, 115 x 116 ft., in Green Street, north of Van Buren Street, where it proposes to erect a six story plant to cost \$400,000.

The Atlas Copper & Brass Mfg. Co., 2734 High Street, Chicago, plans to construct a one-story addition, 50x125 ft., to cost \$20,000. L. Ehle, 3810 Broadway, is the architect and engineer.

L. Engel, 3058 Armitage Avenue, Chicago, will soon let a contract for a one-story garage, 60 x 150 ft., at 3515 Armitage Avenue, to cost \$40,000.

The Klose Weld Engineering Corporation, 219 East Twenty-fourth Street, Chicago, has been incorporated to take over the business of the Klose Welding Co. of the same address, which was not an incorporated company. The incorporators include Julius F. and T. M. Klose and A. Bartoli.

The Acme X-Ray Co., 223 West Madison Street, Chicago, has been incorporated with \$150,000 capital stock by George M. McFedries, Julius J. Grobe, John Lawrie and Frederick Kull to manufacture X-Ray apparatus, surgical machinery, tools and instruments.

The U. S. Meat & Bone Cutter Corporation has been incorporated with \$100,000 capital stock to manufacture bone cutters and meat machinery. The incorporators include Dunlop Smith, Edward R. Tiedebohl and John W. Clark. Manufacturing will not begin for a number of months and for the present temporary offices are in room 810, 209 South La Salle Street, Chicago.

J. A. Johnson, 5949 Ohio Street, Chicago, will build an automobile repair shop at 5615 West Division Street, to cost \$4,000.

The Standard Steel Works, Kansas City, Mo., has commenced the construction of a one and two-story plant, 118 x 305 ft., on Holmes Street northeast of the Long-Bell Lumber Co. millwork warehouse, North Kansas City. The present plant is at Nineteenth Street and Tracy Avenue.

W. A. Masters, clerk school district, Chisholm, Minn., has called for bids on machine shop equipment for the local high school.

J. F. Richter, who for several years has conducted a machine shop at Big Sandy, Mont., has moved his equipment to Hardin and is now open for business at the corner of Second Street and Custer Avenue.

The C. & K. Tool & Die Works, 1637 West Lake Street, Chicago, is having revised plans prepared for its new one-story machine shop, 100 x 185 ft., instead of 100 x 125 ft., at Iowa Street and Forty-seventh Avenue.

Arthur A. Patterson, Inc., 332 South Michigan Avenue, Chicago, has been incorporated with a capital of \$50,000 by R. W. Vanier, Fred W. Reinhardt and M. E. Corcoran, to manufacture mechanical equipment and electrical devices.

The Interstate Iron & Steel Co., 104 South Michigan Avenue, Chicago, has arranged for a bond issue of \$4,000,000, for general operations, expansion, etc. Silas J. Llewellyn is president.

The Artificial Ice Co., 140 North Dearborn Street, Chicago, is considering the erection of a new ice manufacturing and refrigerating plant at Halsted and Ninety-fourth streets, to cost about \$275,000, with machinery.

The Old Ben Coal Co., 332 South Michigan Avenue, Chicago, is planning for the construction of a new power house at its No. 16 Mine, 50 x 85 ft., to cost about \$50,000.

The Christopher Motor Co., 3308 Sheffield Avenue, Chicago, is planning for the erection of a new two-story service and repair building, 125 x 125 ft., to cost about \$5,000. J. A. Taggart, 19 South La Salle Street, is architect.

The Graham-Wittenborn Corporation, 35 South Dearborn Street, Chicago, has been incorporated with a capital of \$40,000 by Leslie B. Graham, C. W. Taylor and W. W. Wittenborn, to manufacture speed accelerating and reducing devices and kindred mechanical equipment.

The Baker Ice Machine Co., Nineteenth and Nicholas streets, Omaha, Neb., manufacturer of ice-making and refrigerating machinery, has awarded contract to A. C. Bush, Omaha, for a one-story addition, 280 x 280 ft., to cost about \$150,000 with equipment.

The City Council, Pawnee City, Neb., is having plans prepared for a new municipal electric power plant, to cost about \$55,000 with equipment. E. T. Archer & Co., New England Building, Kansas City, Mo., are engineers.

Buffalo

BUFFALO, June 6.

The Meldrum-Gabrielson Corporation, Industrial Building, Syracuse, N. Y., manufacturer of milling machines, attachments, etc., is planning the erection of a new two-story machine shop on West Fayette Street, 70 x 150 ft., to cost in excess of \$200,000 with machinery.

The Genesee Light & Power Co., Batavia, N. Y., is contemplating the construction of a new electric plant near Attica to furnish service in this section. Application for permission to build the works has been made to the Public Service Commission.

The Binghamton Street Railway Co., Binghamton, N. Y., is planning the construction of a new electric power house at Endicott, N. Y.

The American Safety Signal Sales Corporation, Rochester, N. Y., has been incorporated with a capital of \$25,000 by C. R. Steim, H. R. Smith and A. F. Hancock, to manufacture signal devices for automobile service. John J. McInerney, Insurance Building, represents the company.

New England

BOSTON, June 6.

With one exception the few sales the past week concern single machines and were about equally divided between new and used equipment. The exception was four lathes with 60-in. swing and 40-ft. bed purchased by a shipping interest at a price close to \$100,000. Manufacturers' quotations remain unchanged, but concessions were made to move some machines sold the past week. A fairly large press order is under negotiation and may be closed within a day or two.

More inquiries are in the market than a month ago and several are good prospects. One large electrical appliance manufacturer is asking prices on production equipment for experimental work in connection with a large Government contract. Sentiment among other users of metal working equipment appears better, yet future business is not sufficiently assured to justify immediate purchases of equipment. At the moment a majority of inquiries originate from smaller concerns developing new lines and with them the price is of primary importance. The Boston & Albany Railroad Co. has bought a 14-in. lathe. Bids are asked on an assortment of Government machine tools held at the Boston Navy Yard.

Several cranes are under consideration, yet prospective buyers appear in no hurry to cover.

The Springfield Bronze Co., Springfield, Mass., contemplates the erection of a one-story factory, 40 x 64 ft.

Plans are practically complete for a one-story machine shop, 300 x 400 ft., to be erected by the Melsel Press Mfg. Co., 944 Dorchester Avenue, Boston.

The Buckwood Sprinkler Co., Worcester, Mass., is building two one-story additions, 33 x 99 ft. and 35 x 80 ft., respectively.

The Turner Construction Co. has been awarded contract for a two-story power plant, 80 x 120 ft., for the American Woolen Co., Lawrence, Mass.

Plans will be soon completed for a two-story, U shaped factory, 60 x 200 ft., to be erected by the Ansonia Electric Co., 55 Main Street, Ansonia, Conn.

The Instant Freezer Co., Springfield, capitalized for \$25,000, has been granted a Massachusetts charter. Paul Werder, 61 Pearl Street, Springfield, is president, and Harold D. Kittinger, 15 Maple Street, treasurer.

The Hood Turbine Co., Boston, with Robert J. Hurley, 83 Endicott Avenue, Revere, president, and Curtis D. Chase, Wellesley Park, Natick, treasurer, has taken a Massachusetts charter, with a capital of \$100,000.

Christian E. A. Gronbeck, 49 Prospect Street, Keene, N. H., is president, and Harry F. Stahler, 20 Hilda Street, East Milton, Mass., treasurer of the New England Production Co., recently given a Massachusetts charter to manufacture a patented razor holder and other metal specialties.

The foundry department of the Albert Russell & Sons Co., Newburyport, Mass., marine capstans, etc., was damaged by fire last week with an estimated loss of \$40,000. Plans are in progress for rebuilding.

Work is progressing rapidly on the new factory building of the George Baker & Sons Co., Brockton, Mass. The main plant will be 100 x 240 ft., with a floor space of 30,000 ft., and will be used for manufacturing tacks, nails, rivets, staples, washers, cotter pins, screws, etc. The annual capacity of the plant will be 3000 tons.

Charles H. Harris, Inc., 186 West Twenty-fourth Street, New York, has awarded a contract to Levering & Garrigues,

552 West Twenty-third Street, for its new one-story plant, 100 x 200 ft., on Main Street, Norwalk, Conn., for the manufacture of automobile windshields. It is estimated to cost about \$75,000. Charles H. Harris is president.

The Plainville Casting Co., Plainville, Conn., recently incorporated with a capital of \$50,000, has tentative plans under way for a new plant for the manufacture of castings and other metal products. It is headed by William Stewart and Charles F. Conlon, Plainville.

The Stoy's Machine Developing Co., Boston, has been incorporated with a capital of \$25,000 to manufacture machinery. Samuel Stoy is president, and Samuel Goldstein, 19 Mildred Street, Dorchester, Mass., treasurer.

The Norwalk Washing Machine Co., Norwalk, Conn., has been incorporated with a capital of \$50,000 by F. A. Giorchino and W. F. Tammany, 20 Fairfield Avenue, to manufacture electrically operated washing machines.

The Federal Wharf Machine Shop, Boston, has filed notice of organization to operate a machine and repair works at 118 Border Street, East Boston. Edmond J. Leveille, Jr., heads the company.

The Morris Automobile Radiator Mfg. Co., Worcester, Mass., has acquired property at 12 Harding Street for the establishment of a new plant for the manufacture of automobile radiators and other metal products. Morris Sepinuck heads the company.

The Lundin Electric & Machine Co., Inc., Boston, has been incorporated with a capital of \$100,000 to manufacture electrically operated machinery and parts. Emil O. Lundin is president, and M. J. Savage, 10 Thatcher Street, treasurer.

A Freedman, 27 Church Street, Springfield, Mass., has plans under way for a new one-story machine shop on Seventh Street, to cost about \$17,000.

The Worcester Electric Tool Corporation, Worcester, Mass., is arranging for expansion and will concentrate production to a large extent on a new aluminum combination electric drill and valve grinder for automobile service. It is proposed to develop an output of about 100 of these machines a week. The company recently changed its name, having previously operated as the Stenman Electric Valve Grinder Co.

The Scovill Mfg. Co., Waterbury, Conn., manufacturer of brass goods, has filed plans for a one-story addition on East Main Street, 50 x 96 ft.

Philadelphia

PHILADELPHIA, June 6.

The Atlas Machine Tool & Welding Co., Philadelphia, has acquired the two story building at Germantown and Stenton avenues, 101 x 115 ft., formerly held by the Weder Mfg. Co., manufacturer of surgical instruments, etc., for the establishment of a new plant.

The Philadelphia Rapid Transit Co., Land Title Building, Philadelphia, has filed plans for extensions and improvements in its car repair works at Kensington and Cumberland streets, to cost about \$10,000.

The J. A. Harris Rim & Wheel Co., Philadelphia, is being organized by J. A. Harris and associates to manufacture metal rims, wheels and other equipment for automobile service. Application for a State charter will be made on June 20. The company is represented by Taylor, Robey & Hour, Stephen Girard Building.

The National Umbrella Frame Co., Thirtieth and Thompson streets, Philadelphia, has filed plans for a one-story addition to its plant on Belfield Avenue, 60 x 120 ft.

The Hittenhouse Motor Car Co., 219 West Hittenhouse Street, Philadelphia, has awarded contract to Ketcham & McQuade, 1029 Brown Street, for a new two-story service and repair building at Germantown and Greene avenues, 40 x 80 ft.

The Paul E. Motron Co., Philadelphia, is being organized by Paul E. Motron, Harry W. Wolfe and Joseph Mundet, to manufacture ice-making and refrigerating machinery. Application for a State charter will be made on June 20. The company is represented by Hazleton Mirkil, Lafayette Building.

The Hurley Motor Co., Broad and Race streets, Philadelphia, has awarded contract to the William Steele & Son Co., Sixteenth and Arch streets, for the erection of a new building at 25 North Broad Street, 80 x 100 ft., to cost in excess of \$500,000.

The Pioneer Auto Safety-Steering Device Corporation, Camden, N. J., has been incorporated with a capital of \$100,000 by J. Lukens Anderson, Philip A. Weigel and Joseph Hoffman, 1225 Broadway, Camden, to manufacture steering equipment and other automobile devices.

The Behrens Crane Co., Merchantville, N. J., has been incorporated with a capital of \$125,000 by Albert Burling,

Merchantville; Albert G. Behrens and J. Newlins Wilkins, Camden, N. J., to manufacture cranes and parts.

The Trenton Chilled Die & Casting Co., Trenton, N. J., has been incorporated with a capital of \$100,000 by Richard B. Newton, B. N. Rich and John H. Conover, Houghton and Cortland streets, Trenton, to manufacture castings and other iron and steel products.

The Keeley Stove Co., Second and Linden streets, Columbia, Pa., has completed plans and will soon award contract for a new one and two-story building, 30 x 50 ft., to cost about \$20,000.

The Pennsylvania Power & Light Co., Allentown, Pa., has taken title to property on Roaring Creek, near Danville, Pa., for the erection of its proposed new hydroelectric generating plant, estimated to cost about \$3,000,000 with equipment. The company is operated by the Electric Bond & Share Co., 71 Broadway, New York.

The Standard Foundry & Machine Co., Pottsville, Pa., has been incorporated with a capital of \$30,000 to manufacture machine parts, castings, etc. B. H. Thompson, Pottsville, is treasurer.

Pittsburgh

PITTSBURGH, June 6.

Closing of contracts for the mills and hammers for the new plant of the International Nickel Co., Huntington, W. Va., constitutes the most important business of the past week in the machinery and equipment market. The seven merchant mills for this plant will be furnished by the United Engineering & Foundry Co., Pittsburgh, while the Standard Engineering Works, Ellwood City, Pa., was the successful bidder for the 30-in. sheet mill and the 26-in. cold mill. Award of the four hammers was split between the Chambersburg Engineering works, Chambersburg, Pa., which secured the two smaller tools and the Massillon Foundry & Machine Co., Massillon, Ohio, which was awarded the two larger hammers. Motors and drivers, it is expected, will be placed this week. In general, business remains exceedingly slack, with some in the trade stating it is worse than it has been. There is basis for this assertion in that a number of inquiries which had been regarded as promising have been deferred, either because it is considered wise to await some definite signs of betterment or because the prospective cut in freight rates is expected to bring further price modifications. The Reilling Mfg. Co., Pittsburgh, which put out an inquiry some time ago for a combination punch and shear, has decided to defer purchase until business is better. We note a sale of a Union hob grinder and a Universal cutter and reamer grinder, both to go to Erie, Pa. Sales still run to individual machines and are supplied out of stock. The new boiler house for the Oliver & Snyder Steel Co., Oliver, Pa., is a duplicate of one at another plant of the company and the equipment list does not call for a crane. The United Engineering & Foundry Co., Pittsburgh, which had an inquiry out for a 15-ton overhead crane, with 5-ton auxiliary, has decided to do nothing until fall. Crane builders who have been figuring on the requirements for the new shops of the Atchison, Topeka & Santa Fe Railroad have been advised that while work on the shops will be pushed, purchase of equipment will go over until the fall. It is not expected that any business will develop until late in the year in connection with plant betterments and extensions of the LaBelle Iron Works, Steubenville, Ohio. The Wheeling Steel Corporation recently closed for a 10-ton hand-power Reading crane for one of its Wheeling plants. The Alliance Machine Co., Alliance, Ohio, was the successful bidder for the 10-ton overhead crane recently placed by the J. E. Moss Iron Works, Wheeling, W. Va. The Koppers Co., Pittsburgh, is reported to have closed for a champion 6-ton bucket trolley for installation at the plant of the Public Service Gas Co., Camden, N. J.

The Crane Co., 636 South Michigan Avenue, Chicago, manufacturer of pipe, fittings, steam specialties, etc., has taken bids for the erection of its new plant at Thirty-fourth Street and the Allegheny Valley Railroad, Pittsburgh. It will include a six-story and basement pipe and pipe bending shop, 192 x 292 ft., and is estimated to cost about \$800,000 with equipment.

The Troop Mfg. Co., Pittsburgh, manufacturer of water heaters, tank heaters, etc., has removed its plant to 2516-26 Jane Street, Southside, recently acquired, comprising a two-story building 80 x 120 ft. It is proposed to triple the output and with available adjoining land, additions will be erected at a future date. Robert A. Troop is president.

The Titan Metal Co., Bellefonte, Pa., has tentative plans under way for the rebuilding of its two-story plant, recently destroyed by fire.

The Schuster-Sterrett Motors, Inc., Pittsburgh, is being organized by Howard H. Schuster, Walter Bieling and James

R. Sterrett, Jr., 1927 Oliver Building, to manufacture automobile and truck parts, and operate a general repair works. Application for a State charter will be made on June 20.

The National Tube Co., Pittsburgh, has acquired the two brick buildings, 48 x 120 ft., at Washington and Second streets, Dravosburg, for \$22,500, and will use the property in connection with its works.

The Feigley Accessories Corporation, Pittsburgh, is being organized by David A. Feigley, Walter C. Anderson and Samuel M. Hazlett, 708 Park Building, to manufacture automobile accessories and equipment. Application for a State charter will be made on June 20.

Fire, May 28, destroyed a portion of the plant of the Valvoline Oil Co., Butler, Pa., with loss estimated at about \$400,000, including equipment and stock.

The North Pole Ice Co., West Carson Street, Pittsburgh, has completed plans for a new seven-story cold storage and ice-manufacturing plant, 100 x 200 ft., to cost about \$400,000, including machinery.

The Forest Coal Co., Fairmont, W. Va., is planning to expend about \$150,000 for the installation of new machinery at its properties, including considerable electrical equipment. The company recently increased its capital from \$100,000 to \$300,000. H. W. Showalter is president.

The Charleston Bolt & Forging Co., Charleston, W. Va., recently organized with a capital of \$300,000, has acquired a building at Nitro, W. Va., for the manufacture of bolts, nuts, spikes, rivets and kindred products. It will defer the erection of a new plant, as previously announced. C. M. Donnavant is president, and J. Peyton Warren, vice-president.

Fire on May 27 destroyed the plant of the Fairmount Carriage Works at Fairmount, W. Va., causing a loss of approximately \$30,000. Part of the building had been used as a service station and garage by Fred Dietrich, the owner. It is understood that it will be rebuilt.

Baltimore

BALTIMORE, June 6.

The Baltimore Car & Foundry Co., Curtis Avenue, Baltimore, will build a one-story power house. Plans have been completed.

Joseph Thomas & Son, Inc., 818-36 Leadenhall Street, Baltimore, has filed plans for four two-story brick buildings on Leadenhall Street to replace its wood-working plant, recently destroyed by fire. The new works will cost about \$300,000, including equipment.

The Holdtite Mfg. Co., 919 East Baltimore Street, Baltimore, has awarded contract to R. B. Mason, 308 West Madison Street, for its proposed plant, 50 x 142 ft., for the manufacture of rubber goods, estimated to cost about \$28,000, exclusive of equipment. The machinery installation, including presses, etc., will cost approximately \$30,000. Albert A. Esterson is secretary and treasurer.

Freight-handling equipment will be installed in the steel sheds to be erected by the Board of Harbor Commissioners, Wilmington, Del., in connection with harbor improvements, a first bond issue of \$600,000 for which has been voted. Bids for the buildings will be received up to June 20.

The Common Council, Silex City, N. C., is planning for the construction of a hydroelectric power plant on the Deep River for municipal service.

A. L. Flint, general purchasing officer, the Panama Canal, Washington, will receive bids until 10.30 a. m., June 23, for equipment for canal zone service, including grab bucket, steel cable, magnet wire, locomotive shoes, vacuum pump, valves, brass tubing, micrometers, electrical equipment, etc., as set forth in Circular No. 1451. The assistant purchasing agent is located at 24 State Street, New York.

Fire, May 25, destroyed the plant of the Bahan Textile Machinery Co., Union, S. C.

The Bristol Stove & Foundry Co., Bristol, Va., has been incorporated with a capital of \$50,000 to manufacture stoves, stove castings, and other iron and steel products. H. B. Wilkinson is president, and J. C. Rucker, secretary.

The Thompson Spring Co., Wilmington, Del., has been incorporated with a capital of \$300,000 by Clarence W. Thompson, Walter K. Jeffers and Franklin L. Mettler, 832 Market Street, to manufacture springs for vehicles and automobiles.

The Standard Oil Co., Baltimore, has completed plans for a new one-story power house, 93 x 143 ft., on Third Avenue, to cost about \$50,000.

The Faultless Piston Ring Co., Rome, Ga., has been incorporated with a capital of \$200,000 by O. M. Lanham and George Garrison, Rome, to manufacture piston rings for automobile engines, and kindred products.

Detroit

DETROIT, June 6.

The Purity Stamping Co., Battle Creek, Mich., manufacturer of milk strainers, is contemplating the erection of a two-story factory. W. T. Hulcher is president.

The Metal Office Furniture Co., Grand Rapids, Mich., has awarded contract for an addition to the Owen-Ames-Kimball Co. It will be two stories, 150 x 150 ft., and cost \$50,000.

The American Seating Co., Grand Rapids, Mich., has taken out a permit for an addition to cost \$10,000.

The Angle Steel Stool Co., Otsego, Mich., it is reported, will soon be in the market for equipment to take care of its growing business.

The Wildman Rubber Co., Bay City, Mich., has awarded contract to the Bay City Stone Co. for the erection of the first unit of its tire manufacturing plant to cost \$1,000,000. The structure will be of reinforced concrete, 161 x 365 ft., three stories and basement. W. W. Wildman is president.

The R-J Generator Co., Lowell, Mich., has been incorporated with a capital of \$500,000 by John E. and O'Neill Best, and Nicholas J. Politis, 532 Ottawa Street, Grand Rapids, Mich., to manufacture steam and gas generators, pumps and similar machinery.

The Reliance Engineering Co., Lansing, Mich., has been incorporated with a capital of \$25,000 by E. C. Shields, L. A. Wilford and Henry Fisher, Lansing, to manufacture gasoline engines and parts.

Fire, May 23, destroyed a portion of the plant of the Sturgis Electric Plating Works, Sturgis, Mich., with loss estimated at about \$25,000, including equipment.

The Woodland Piston Co., Muskegon, Mich., has been incorporated with a capital of \$75,000 by Herbert L. Woodland, Herbert H. Huntley and Percy G. Wilson, Muskegon, to manufacture pistons, piston rings and kindred equipment for automobile service.

The Jig Rushing Co., Pontiac, Mich., has been incorporated with a capital of \$25,000 by Otis R. Briney, Lawrence M. Richards and Emmanuel B. Hummins, Pontiac, to manufacture jig bushings and similar equipment.

The Osgard File Works, Inc., Detroit, has been incorporated with a capital of \$25,000 by E. L. and H. K. Deacon, and E. M. Osgard, 226 Orleans Street, to manufacture files, rasps, etc.

Ohio

CLEVELAND, June 6.

Some local dealers report a slight improvement in inquiries for single tools, but others find no change in conditions. The inquiries coming out from week to week that are not resulting in orders indicate that a fair volume of business is backing up, which is expected to be placed when business revives. Owing to the slump in the automobile trade there is virtually no business coming from that source at present. Before this there was a little activity on the part of automobile parts manufacturers. Dealers report a fair demand for machine tool repair parts and accessories.

In Cincinnati machine tool inquiries show a little improvement, but great difficulty is still being experienced in closing orders. Most of the inquirers need the tools, but either buy used equipment or decide to hold off purchasing for the present. A local dealer reports the receipt of a sizable order for power hammers from a West Virginia company, and a local manufacturer took an order for six machines from a company in the South. Part of the purchase by the Virginian Railroad will come to manufacturers in this city, and in addition to the tools recently bought by this road, a local builder has secured an order for two more machines. The Big Four has not yet purchased against its recent inquiry, but may do so this week, and action is expected to be taken by the Illinois Central in the near future. Lathe manufacturers report the receipt of several orders from the oil fields in the Southwest, the first from this source for some time.

The Marion Coaster Co., Marion, Ohio, has been incorporated with a capital stock of \$20,000 to manufacture children's vehicles. Fred Haverman, Jr., James Linko, N. B. Rule and others are interested.

The Lea Handle Co., Bucyrus, Ohio, has been incorporated with a capital stock of \$20,000 and will manufacture baseball bats, bowling pins and other sporting goods. The company will take over the business that has been conducted by N. H. Lea, and is building a factory addition.

The Board of Trade, Urichsville, Ohio, has authorized the purchase of 12 acres as a site for a proposed factory of the Lucius Steel & Welding Products Co.

The Ohio Metal Stamping & Mfg. Co., Akron, Ohio, has been incorporated with a capital stock of \$50,000 by R. B. Spake, C. L. Johnson and others to manufacture metal stampings.

The Aircraft Engineering Co., Dayton, Ohio, was recently incorporated with a capitalization of \$50,000 to manufacture aeroplane parts. W. A. Penrod, B. W. Dawson, John Connolly, E. L. Haas and Ralph Maple are named the incorporators.

Indiana

INDIANAPOLIS, June 6.

A 4-acre tract has been obtained at Mars Hill, a suburb of Indianapolis, as a site for a plant for the American Valve & Tank Co., a Delaware corporation with \$200,000 capital stock. The first unit will be 50 x 150 ft. and will contain the machine shop, nickel plating and porcelain enameling departments. Iron and brass foundries will be built later. Charles B. Wedding, Chicago, formerly of Indianapolis, is president; Samuel Springer, vice-president, and Charles A. Wulf, secretary-treasurer. Mr. Wulf is the inventor of the American line of plumbing supplies and the company will have exclusive manufacturing rights, though they have been made by other companies for several years.

The Graver Corporation, East Chicago, Ind., has secured the contract for a refinery for the Indiana Oil Refining Co., Columbus, Ind., at a cost of approximately \$20,000.

The first unit of the plant of the Duesenberg Motor Co., Harding and West Washington streets, Indianapolis, has been completed at a cost of \$300,000. A second unit is under construction and a third will be added. The company is dismantling its former plant at Elizabeth, N. J., and is moving much of the machinery to Indianapolis. B. A. Worthington is president.

The Martin Howe Coal Co., Bicknell, Ind., is planning to rebuild its tippie and mechanical plant at No. 1 mine, destroyed by fire, May 24, with loss estimated at about \$100,000, including equipment.

The Western Airline Co., 408 Broadway, Cincinnati, is planning the erection of two one-story buildings at Seymour, Ind., for the manufacture of airplanes and parts. C. E. Lay is president.

The Lavelle Foundry Co., Indianapolis, has filed plans for extensions in its plant on West Michigan Avenue.

The Upton-Dussell Co., Bristol, Ind., has been incorporated with a capital of \$50,000 by Henry Dussell, Linford Upton and Arthur Semple, Bristol, to manufacture gasoline engines, parts and other kindred equipment.

The New York Blower Co., 608 South Dearborn Street, Chicago, manufacturer of mechanical fans, blowers, etc., is considering the erection of a one and two-story addition to its plant at Laporte, Ind. Henry Mathews is acting president.

The Burns-Pollock Electric Mfg. Co., Indiana Harbor, Ind., has been incorporated with a capital of \$1,000,000 by A. J. Burns, Thomas Pollock and J. G. R. O'Hara, Indiana Harbor, to manufacture electrical machinery and appliances.

The Central South

ST. LOUIS, June 6.

Cosden & Co., Tulsa, Okla., will make extensions and improvements in the power house at their local oil works to cost about \$100,000. New equipment will be installed.

Fire, May 31, destroyed a portion of the plant of the Oliver Gas Oil Burner & Machine Co., 2030-32 Pine Street, St. Louis, manufacturer of gas and oil burning equipment and devices.

The Massey Refining Co., Scottsville, Ky., has plans under way for the erection of a new oil refinery, with initial daily capacity of about 500 bbl. S. H. Massey is head.

The Illinois Central Railroad, 135 East Eleventh Place, Chicago, is considering the erection of additions to its repair shops and locomotive house at Paducah, Ky.

The Louisville & Nashville Railroad, Louisville, is building a new one-story boiler plant at Paris, Tenn., 100 x 125 ft., and estimated to cost about \$100,000. The G. H. Rummel Co., 958 Logan Street, Louisville, is contractor.

The Signal Mountain Cement Co., Chattanooga, Tenn., is taking bids for the erection of a new plant, estimated to cost about \$200,000, with equipment.

E. L. George, Bartlesville, Okla., secretary of the local Chamber of Commerce, is developing plans for the formation of a company to establish a new plant for the manufacture of automobile tires and tubes.

The Cameron Refining Co., Ardmore, Okla., has completed plans for additions to its refinery, to increase the daily capacity from 3000 to 4000 bbl.

The Collapsible Rim Mfg. Co., Asheville, N. C., has acquired the plant of the Buzz Engineering Co., Louisville, for new works for the manufacture of metal rims for automobile service. An addition will be erected for rolling mill operations. L. Culberth is president.

The Southerland Coal Co., Henderson, Ky., is planning to rebuild the coal tipples at its properties, and power house, destroyed by fire, May 25, with loss estimated at about \$75,000.

The Duplex Tire & Rubber Co., New Gates Hotel, Joplin, Mo., is arranging for the erection of a new three-story plant on Seventh Street, 100 x 350 ft., for the manufacture of automobile tires and tubes, estimated to cost about \$100,000.

The Mendenhall Torpedo Co., Duncan, Okla., has been incorporated with a capital of \$20,000 by G. L. Wilson, Duncan; W. H. Hamilton and T. W. Mendenhall, Wichita Falls, Tex., to manufacture torpedoes and other explosives.

Fire, May 24, destroyed a portion of the works of the Gordon Metal & Iron Co., Bunker and James streets, Kansas City, Mo., with loss estimated at about \$50,000.

The State Board of Education, Topeka, Kan., J. A. Kimball, business manager, will take bids up to 2 p. m., June 21, for a new two-story power plant at the University of Kansas, Lawrence, to cost about \$100,000.

Milwaukee

MILWAUKEE, June 6

Only a small volume of machine-tool business is passing, orders usually being for a single tool for immediate shipment. There is a fair amount of inquiry but these usually indicate that transactions will be closed only at liberal concessions, which sellers are not inclined to grant. While the used tool market is not so active as before, this class of machines is giving perhaps keener competition. Hope is expressed that the automotive industries will be able to pick up output following the general reductions of prices on passenger cars to the public, which is counted upon to stimulate a demand that flattened perceptibly in the last four to six weeks.

Steel foundries have been compelled to reduce operations still further, especially those specializing in heavy work. Gray and malleable shops are able to maintain forces at the high point reached recently following a period of sharp curtailment.

The E. & W. Co., 325 Oregon Street, Milwaukee, manufacturer of trailers, trucks, convertible truck attachments, shock absorbers, etc., has increased its capital stock from \$200,000 to \$225,000 of preferred stock and 4000 shares of common stock without par value. The concern is building a new shop, 60 x 120 ft., at Cedarburg, Wis., to be ready about Aug. 1.

The Sphinx Machine Co., Milwaukee, has been organized with a capital stock of \$25,000 preferred, plus 500 shares of common stock without par value, to manufacture ice and refrigerating machinery. Walter F. Teschan, president Milwaukee Concrete Mixer Co., 955 Thirtieth Street, and Henry L. Krueger, Frank C. Schroeder and H. W. Rottel are incorporators.

Henry Powers & Co., Chippewa Falls, Wis., will build a public garage and service building, 66 x 82 ft., two stories and part basement, estimated to cost \$25,000. The architects are Schopp, Dorch & Camastile, local.

The Board of Industrial Education, Fond du Lac, Wis., awarded the contract to the Inmel Construction Co., local, for the erection of a \$75,000 addition to the central continuation school and manual arts institute. Purchases of additional equipment will be made soon. J. E. Hennen is architect.

The Lazear Products Co., Racine, Wis., has been incorporated with an authorized capital stock of \$100,000 to manufacture automotive accessories, parts and metal products generally. The incorporators are Chester Dahl, Charles F. Wratten and M. E. Walker, attorney.

The Zwebell Brothers Co., 482 Milwaukee Street, Milwaukee, has awarded the general contract to Walter Tuckwell, 575 National Avenue, for a brick, steel and concrete machine shop, 60 x 100 ft., part two stories and basement, for manufacturing vulcanizing, tire repair and other automotive machinery, tire molds, etc. The investment will be about \$45,000.

The Modern Pouring Device Co., Port Washington, Wis., has been granted a charter to manufacture pouring and lifting devices, cranes, hoists and similar equipment. The capital stock is \$50,000. The incorporators are Max Goldberg, M. J. Knappe and Norman E. Henze, all of Port Washington.

The Algoma Foundry & Machine Co., Algoma, Wis., is erecting a small addition for testing, assembling and finishing gas engines, feed cutters and other farm specialties.

The Board of Education, Barron, Wis., will close bids June 10 for the construction of a \$50,000 addition to the Barron high school, to be equipped for vocational training. The architect is Carl Volkman, Eau Claire, Wis.

The Giant Grip Co., Oshkosh, Wis., has increased its authorized capital stock from \$125,000 to \$250,000 to finance development of the business and future extensions. It was originally established as the Challoner Co. The principal products are portable sawmill and wood-working outfits, anti-skid chains for motor trucks and light forgings.

The Hartford Tool & Machine Works, Hartford, Wis., Fred F. Jordan, proprietor, is making repairs and replacements of buildings and equipment, which were badly damaged by fire on May 15. Later it is the intention to build a brick and concrete shop, 50 x 90 ft.

The More Power Spark Plug Co., Milwaukee, has been chartered with a capital stock of \$200,000 to manufacture spark plugs and other ignition devices for gas engines. The incorporators are Roy G. Hale, Edwin Krenzel and August Haberer, 889 Thirty-ninth Street.

The South Side Garage, Inc., 1133 Indiana Avenue, Sheboygan, Wis., will build a two-story brick addition, 32 x 45 ft., to its garage. It will be used largely for repairs, service and machine work.

The Moloch Co., Kaukauna, Wis., manufacturer of automatic stoking equipment, power hammers and special machinery, expects to take occupancy of its new plant costing \$150,000 about July 1. The machine shop is receiving equipment and the installation of electric cranes is being made in the foundry. It is a consolidation of the Kaukauna Foundry & Machine Works and the Moloch Automatic Stoker Co., formerly of Chicago.

The Oshkosh Tractor Co., Oshkosh, Wis., has been incorporated with a capital stock of \$150,000 of preferred stock to manufacture tractors, engines, implements, etc. The organization is effected for the purpose of transferring the LaCrosse Tractor Co., from LaCrosse, Wis., to Oshkosh, and it is intended to erect a group of buildings during the summer. Harvey P. Phynner, Milo J. Gilbert and Bart W. Heiss, all of Oshkosh, are the incorporators.

The Radiolite Mfg. Co., Milwaukee, is being organized with a capital stock of \$150,000 to manufacture kerosene vapor lamps. The device has been in production on a small scale for three years. A factory will be leased and some new equipment will be purchased. The incorporators are Dr. Robert G. Kohlsdorf, E. Cassidy and Adolph Kanneberg, attorney, 82 Wisconsin Street, Milwaukee.

The J. P. Davis & Son, Co., Chicago, manufacturer of boilers, tanks, smokestacks and other plate work, has acquired the property of the Del'ere Mfg. Co., Del'ere, Wis., also manufacturing similar lines. The new owner plans to resume operations about June 15 and is overhauling the plant and retooling portions of the works. The Del'ere company was organized about five years ago and took over the plant and equipment of the former Lyons Boiler Works Co. The Davis company has headquarters in the Harris Trust Building, Chicago, and operates works at Boston, Hopewell, Va., and Carney's Point, N. J. It is capitalized at \$500,000. J. P. Davis is president and general manager.

The Jenkins Machine Co., Sheboygan, Wis., manufacturer of wood-working tools and machinery, has purchased the patent rights to a new routing and carving machine of the multiple type designed by Julius Hamacheck, Two Rivers, Wis., and will place it in production immediately. The machine is practically automatic and is operated by an electric motor and has a maximum speed of 20,000 r. p. m.

The Racine Engineering Co., Racine, Wis., manufacturer of tractors, has decided to relocate in Sheboygan, Wis., and will be reincorporated at once as the Dodge-Sheboygan Co., with a capital stock of \$100,000. The product is known as the Dodge Universal Trac-Trac, being a combination machine designed for the work of a motor truck, farm tractor, field hauler and cultivator. It is intended to erect a one-story brick and steel shop building, 60 x 150 ft., as the first unit of the new work, to be ready about September 1. A. Y. Dodge is president and chief engineer.

The Biggam Trailer Co., 802 First Wisconsin National Bank Building, Milwaukee, organized several months ago with a capital stock of \$200,000, is considering tentative plans for a factory. Since organization its production has been handled under contract with existing shops. Details of the new construction and equipment project have not been divulged. H. F. Biggam is president and general manager.

The Common Council, Kaukauna, Wis., has engaged W. E. Reynolds, architect, to design a two-story brick, steel and concrete municipal building, 100 x 145 ft., to contain a vocational training school. The estimated cost is \$200,000, including manual arts equipment. The Scharrow Iron Products Co., Racine, Wis., has been organized with a

capital stock of \$25,000 by F. E. Scharlow, Andrew Matson and William Christensen, to manufacture hardware specialties, automotive accessories and equipment. Mr. Scharlow, several months ago, retired from the Scharlow Mfg. Co., South Milwaukee, Wis., which he founded in 1912. A machine shop has been established in Racine but enlargement is planned.

The Village Board, Goodman, Wis., has awarded the general contract to the Foster Construction Co., 114 Grand Avenue, Milwaukee, for a two-story high school, with manual arts department, 88 x 175 ft., estimated to cost \$100,000. The architect is Edward Tough, Madison, Wis.

The Illumine Products Co., Milwaukee, has been incorporated with a capital stock of \$10,000 to manufacture automobile and other accessories and specialties. The incorporators are Clifford L. Laduenasse, Chris Trinkl and John F. Wulf, 90 Mason Street, Milwaukee.

California

LOS ANGELES, May 31

The Southern California Edison Co., Los Angeles, has acquired property at Harvard and Walnut streets, Fullerton, Cal., for the erection of a new power house to cost about \$50,000.

The Clark-Turner Piston Co., Los Angeles, manufacturer of pistons for automobile engines, will install considerable new machinery at its plant for increased production.

The United States Electric Steel Products Co., Inc., San Francisco, has acquired about 200 acres at Sacramento, Cal., for the erection of a new plant to manufacture steel products. A power plant will also be constructed. The Electric Furnace Construction Co., 908 Chestnut Street, Philadelphia, is interested in the project, and will handle all the electric furnace installation. It is said that the new works will cost in excess of \$5,000,000.

The Atchison, Topeka & Santa Fe Railroad Co., Los Angeles, has filed plans for a new one-story repair shop at San Bernardino, Cal., estimated to cost about \$50,000.

The Gulf States

BIRMINGHAM, June 6

The Cadenhead Auto Rim Co., Tarrant, Ala., is completing the first unit of its new works for the manufacture of metal automobile rims, and plans to occupy the structure at an early date. It comprises two buildings, 60 x 160 ft. and 60 x 120 ft., and it is proposed to develop an initial daily output of about 3000 rims. Later other additions will be erected. J. T. Cadenhead is president.

The Vulcan Radiator Co., Birmingham, Ala., recently organized, has leased a building for the establishment of a plant to manufacture automobile radiators and other metal specialties. A machine and repair works will be installed, as well as automobile body department. Robert H. Alexander is president, and R. G. Alexander, secretary and treasurer.

The Chickasaw Shipbuilding & Car Co., Fairfield, Ala., is planning for the early occupancy of its new plant for the manufacture of pressed steel cars. With orders on hand for about 1000 cars it is proposed to develop an output of 25 cars per day.

Charles Colvin, Sheffield, Ala., and associates, are planning the establishment of new works for the manufacture of fire hydrants and kindred products. A site is being selected.

The Birmingham Canning Machinery Co., Birmingham, Ala., is planning for the erection of a new factory for the manufacture of canning machinery to be operated by steam pressure.

The F. H. Koretke Brass & Mfg. Co., 922-26 Magazine Street, New Orleans, La., is considering the erection of a one-story addition to its brass foundry. W. E. Gosselin is vice-president and general manager.

Fire, May 23, destroyed a portion of the plant of the Parkersburg Rig & Reel Co., Ranger, Tex., manufacturer of oil-well machinery, with loss estimated at about \$50,000.

The Lucey Co., Houston, Tex., recently organized to manufacture oil-well equipment, has filed plans for a new factory, 50 x 75 ft., estimated to cost about \$25,000. Neal Lucey, box 1072, is president, treasurer and general manager.

The Florida Oil & Refining Association, Tampa, Fla., has acquired about 1000 acres at Piney Point, near Ross, Fla., for the erection of a new refinery. It will be constructed in two units, with initial capacity of about 2000 bbl per day, and is estimated to cost about \$250,000, including machinery. R. H. Webster is president.

The Common Council, Georgetown, Tex., is planning for the installation of considerable equipment in the addition

to be erected at the municipal electric power plant, comprising engine, generating apparatus, and auxiliary operating machinery. Work will commence at once.

J. P. Sutton, New Orleans, La., is in the market for equipment for his foundry recently destroyed. A new building, 110 x 150 ft., will be erected.

The city of Meridian, Miss., has voted \$600,000 for the equipment of an electric light and power plant.

Canada

TORONTO, June 6.

The demand for machine tools has again fallen off. Buyers are only entering the market for single tools and these are less active than a week ago. Small tools are showing more activity and some users are entering the market with larger lists. There is still a tendency on the part of some dealers to shade prices, but even this is not having a stimulating effect. Used equipment is still moving in a fairly active way, but little buying is being done. A new price is announced on taps which amounts to a reduction of about 10 per cent.

W. H. Morthmer, Walkerton, Ont., is in the market for a drilling machine.

Edgar B. Rolstop, Kerrobert, Sask., is in the market for a small sawmill outfit and planer, also water-wheel equipment.

The town of Antigonish, N. S., will build a pumping station at a cost of \$15,000 and will install other equipment.

Bids are being received by the chairman and members of No. 2 Committee, London, Ont., E. S. Little, mayor, for four horizontal centrifugal sewage pumps of 1350 Imperial gal. per min. capacity each, against a head of 50 ft.

London Motors, Ltd., East London, Ont., W. Stansell, manager, will have plans prepared at once for the erection of a factory.

The Iron foundry owned by Fleming Brothers, Cabot Street, Halifax, N. S., was destroyed by fire with loss of \$15,000. It will be rebuilt.

The Canadian Johns-Manville Co., Ltd., with sales office at Montreal and Toronto, and which for several years has been operating asbestos properties at Asbestos, Que., has awarded contracts for the erection of a plant in that town, where it will manufacture all classes of asbestos products formerly imported from the United States.

The general contract for an addition to the power house to cost \$50,000 for the Montreal Light, Heat & Power Co., 83 Craig Street West, Montreal at Cedar Que., has been awarded to Anglin-Norcross, Ltd., 65 Victoria Street, Montreal.

SHORT TRADE ITEMS

The Edgeworth Steel Co., 92 Washington Street, North Boston, has succeeded Fitz, Dana & Co., heavy hardware established in 1866 and until recently located at 110 North Street. The new firm consists of D. W. Stressenger, W. W. Hanson and L. B. Hutchings. It has taken over the Fitz Dana & Co. warehouse at Edgeworth, Mass.

The firm name of Churchill, Morgan, Critchinger, Inc., Worcester, Mass., grinding machines, has been changed to the Morgan Grinder Co.

Reed, Fears & Miller, Inc., Boston, New York and Philadelphia, pig iron and fuel, announce the establishment of a coal department at 514 Stock Exchange building, Philadelphia, which will be under the direction of Jervis W. Burdick.

The Equipment Corporation of America, having offices and plants in Chicago, Pittsburgh and Philadelphia, has just purchased another plant at Primos, Delaware County, Pa. This new acquisition makes five plants which the company operates, for the rebuilding of all classes of contractor's equipment, such as hoisting engines, concrete mixers, steam shovels, locomotive cranes and excavators. The new plant at Primos comprises about eight and one-half acres, approximately one-half of which is now under cover. It is situated on the West Chester division of the Pennsylvania Railroad, about eight miles from the heart of Philadelphia. The organization which the company now maintains at its Philadelphia plant, Thirty-first and Walnut Streets, will move to its new home as soon as work on the buildings is completed.

The Illinois Pipe & Mfg. Co., 2111-2129 South Jefferson Street, Chicago, has moved to 3465 South Lawndale Avenue.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The quotations given below are for small lots, as sold from stores in New York City by merchants carrying stocks.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price	3.23c.
Swedish bars, base price	12.00c.
Soft steel bars, base price	3.23c.
Hoops, base price	4.15c. to 4.28c.
Beams, base price	3.88c.
Beams and channels, angles and tees	
3 in. x ¼ in. and larger, base	3.23c. to 3.33c.
Channels, angles and tees under 3 in. x ¼ in., base	3.23c.

Merchant Steel

	Per Lb.
Tire, 1½ x ½ in. and larger	3.23c.
(Smooth finish, 1 to 2½ x ½ in. and larger)	3.43c.
Toe culk, ½ x ¾ in. and larger	3.75c.
Cold-rolled strip, soft and quarter hard	10.00c. to 10.50c.
Open-hearth spring steel	4.50c. to 8.00c.
Shafting and Screw Stock:	
Rounds	4.73c.
Squares, flats and hex.	5.23c.
Standard cast steel, base price	14.00c.
Extra cast steel	17.00c.
Special cast steel	22.00c.

Tank Plates—Steel

¾ in. and heavier	3.23c. to 3.33c.
-------------------	------------------

Sheets

Steel Wire

BASED PRICE* ON NO. 9 GAGE AND COARSER	Per Lb.
Bright basic	4.50c.
Annealed soft	4.50c.
Galvanized annealed	5.25c.
Coppered basic	5.00c.
Tinned soft Bessemer	6.50c.

*Regular extras for lighter gages.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Metal Markets."

Brass Sheet, Rod, Tube and Wire

BASE PRICE

High brass sheet	17 c. to 19½ c.
High brass wire	18½ c. to 21½ c.
Brass rod	16 c. to 20½ c.
Brass tube, brazed	30½ c. to 31½ c.
Brass tube, seamless	20½ c. to 21½ c.
Copper tube, seamless	22½ c. to 23½ c.

Copper Sheets

Sheet copper, hot rolled, 24 oz., 22c. to 24c. per lb. base.	
Cold rolled, 14 oz. and heavier, 2c. per lb. advance over hot rolled.	

Tin Plates

Bright Tin	Grade	Grade	Coke—14x20	Primes	Wasters
	"AAA"	"A"			
	Charcoal	Charcoal

Lake ingot	16c.
Electrolytic	16c.
Casting	16c.

Spelter and Sheet Zinc

Western spelter	6½c. to 6¾c.
Sheet zinc, No. 9 base, casks	11½c. open 12c.

Lead and Solder*

American pig lead	6c.
Bar lead	6½c. to 7c.
Solder, ½ and ½ guaranteed	24¼c.
No. 1 solder	21½c.
Refined solder	18½c.

*Prices of solder indicated by private brand vary according to composition.

Spelter Metal

Best grade, per lb.	80c.
Commercial grade, per lb.	40c.
Grade D, per lb.	35c.

Antimony

Asiatic	6½c. to 7c.
---------	-------------

Aluminum

No. 1 aluminum (guaranteed over 99 per cent pure), in ingots for remelting, per lb.	30c. to 33c.
---	--------------

Old Metals

Although an easier tone prevails, the market is very sluggish. Dealers' buying prices are nominally as follows:

	Cents Per Lb.
Copper, heavy and crucible	10.50
Copper, heavy and wire	9.75
Copper, light and bottoms	8.00
Brass, heavy	5.75
Brass, light	4.00
Heavy machine composition	9.50
No. 1 yellow brass turnings	5.00
No. 1 red brass or composition turnings	7.50
Lead, heavy	4.00
Lead, tea	3.00
Zinc	3.00

VOL. 108: No. 26

Casting Small Parts in Production Foundry

Short Side Movements Supplement Continuous Forward Progress in New Gilbert & Barker Mfg. Co. Plant—Ample Distance from Bed to Charging Door

BY GERRARD FRAZAR

IN designing the new foundry of the Gilbert & Barker Mfg. Co., Springfield, Mass., the engineers, not only arranged the various working departments with a view to quantity production at a minimum operating cost, but embodied ventilating and lighting features that insure maximum comfort and health of employees. The plant is equipped for con-

flooring expedites the movement of electric trucks, eliminates to a great degree wet working areas, and has other well known advantages. Wherever possible, large wall windows are installed. In addition, practically every department is provided with generous overhead natural light and ventilation through monitors and doors leading outside each department, as well as

Light Is Provided for the Foundry Proper Not Only by Windows in Side and End Walls and Monitors but Also by the White Paint on the Inner Wall

tinuous pouring and when run at capacity will give employment to approximately 300.

Briefly, it is composed of a 60 x 450 ft main foundry, with executive offices on one end, and cleaning room and pattern storage, galvanizing department, sand storage, cupolas, core rooms and brass melting department—arranged in sequence adjoining one side of the foundry proper. In the arrangement of these subsidiary units, the continuous forward movement of products in the process of manufacture was kept in mind, as has been common practice in foundry design recently. In this instance, however, the forward movement is accompanied by a series of short side movements related to core baking, so timed, by location of working positions, as to minimize lost motion in the general forward movement of products. The plant is strikingly compact for one of its proportions.

In the main foundry and in many of the subsidiary units the flooring is laid with approximately 300,000 creosoted wooden blocks, costing about \$25,000. This

to the foundry proper. The plant is heated by steam throughout. The foundry walls are 37 ft., 6 in. high, being 32 ft. to the bottom of the trusses. All windows in the top of the main foundry are mechanically operated and can be tipped to an angle of 90 deg.

The main foundry is served by one 10-ton and one 5-ton Shepard electric traveling crane. In addition, there are six one-ton Curtis pneumatic wall cranes at convenient points. With such crane equipment and with electric trucks the handling of sand, flasks and castings ranging from ½ lb. up is speeded. No wooden flasks are used, the foundry being equipped with Sterling steel and Adams snap flasks especially adapted for Gilbert & Barker Mfg. Co. products, which are principally gasoline and oil measuring pumps. Castings for these products do not run much above 300 lb. The crane equipment is adapted for much larger castings in anticipation of changed requirements.

All mold-making is mechanical, 21 shockless and 31 jar and squeeze type—a total of 52 Tabor machines—

Steam Heat Keeps the Sand from Freezing in Winter. The track for the sand cars is set in a concrete floor in the sand storage department.

constituting the equipment. The molding machines are, as is usual, arranged along both sides of the long walls of the main foundry and are air-operated. Air, steam, water and oil are delivered to the plant through an underground conduit from the power house, some distance away. All delivery piping inside the plant is contained in metal-covered, cement trenches extending along inside walls, easily accessible in case repairs are necessary. At one end a spur from the general yard switching trackage enters the main foundry, which provides for one car at a time to be loaded and unloaded under cover.

The core room, 60 x 100 ft., is located in the lower end of the plant. Here the arrangement of the equipment provides liberal space for the movement of cars. The oven equipment design is of the latest of the W. W. Sly Mfg. Co., Cleveland. There are 14 ovens in all, seven draw and the balance two-car type. The small or draw ovens are 6 ft., 5 in. x 3 ft., 10½ in., and the others 5 ft., 8 in. x 14 ft., 6 in. each. All are oil-heated and are provided with Gilbert & Barker burners. Two Spencer turbo blowers serve these ovens as well as two brass melting furnaces in an adjoining unit. The two-

car ovens are the double-end style, the cars being pushed into the ovens from one end and subsequently out the other end, where the cores are trimmed, inspected, etc., on the main foundry molding floor.

The Gilbert & Barker products involve light brass parts. To provide for these, two oil-burning, brass-melting furnaces equipped with the company's burners, each with a capacity of 1800 lb. per eight-hour running time, are installed in a separate unit, 19 x 40 ft., at the right of the extreme lower end of the main molding floor and in close proximity to the core oven room. Cement, instead of wooden blocks, constitutes the flooring in this, as well as the core oven unit. Though molding of brass castings is distinctly apart from other molding, the arrangement of the units allows the two classes of work to dovetail.

Mixing of sands is done by two direct motor-driven Beystone Mfg. Co., Cambridge Springs, Pa., mixing machines in a separate unit within the sand storage department. In this mixing room is located also the electric control, not only for the mixing machines, but for two 5 hp. a.c. skip hoists, as well. These skip hoists operate above 14 sand storage bins in the department proper, each of which have a capacity of 60 tons, or a total of 840 tons. The storage department being steam heated, an adequate supply of workable sand can be maintained in the coldest weather. The sand is unloaded from cars on a railroad siding outside this department. Skips operate through swinging doors, over inclined wooden trestles to the cars where they are loaded, and returned to the bins. By the electric control the skips can be stopped at any predetermined point or bin, and automatically unloaded, thereby reducing handling charges. The flooring in the sand storage is of cement in which tracks and turntables are inserted for transporting sand in push cars, an auxiliary system for use only when electric trucks become incapacitated or overloaded. Each bin has its individual card on which is a record of the grade of sand, the car number and from whom the sand is purchased, dates of storage and usage.

An extremely satisfactory distance between the bed and the charging door, which gives maximum efficiency, is the outstanding feature of the cupola installation. This installation consists of a No. 9½ and a No. 8 Whiting cupola, the former having a shell diameter of 90 in. and an inside diameter of 70 in., while the shell diameter of the No. 8 is 78 in. and the inside 60 in. Combined, these two cupolas have a capacity of 30 to 35 tons per hour. Their total height is 51 ft., and

There Are 14 Core Ovens, Seven Draw and the Remainder Two-Car Type. The latter are of the double-end style.

The Distance from the Bed to the Charging Doors of the Cupolas Is 21½ Ft.

from the bed to the charging door is 21 ft., 6 in. It is therefore possible to charge each of the cupolas heavily before turning on the air.

Air for the No. 9½ cupola is furnished by a No. 7A Wilbraham-Green rotary positive pressure blower, direct-connected to motor, having a displacement of 55 cu. ft. per revolution. The No. 8 cupola is served by a No. 6A blower, of the same make and similarly connected, having a capacity of 35 cu. ft. per revolution. These blowers are stationed in an intermediate brick room below the charging floor, together with a system for heating water used in washrooms. Adjoining this room is the laboratory, which is comparatively small, but excellently equipped for all requirements. The proximity of this laboratory to the cupolas is a favorable feature.

The cupola charging equipment is mechanical and also is furnished by the Whiting Corporation. It consists of 3-ton iron charging cars, and combination coke and scrap charging cars, each having a capacity of 600 lb. of coke and 3000 lb. of scrap. The iron, scrap and coke are delivered to the charging floor by a 3-ton electric elevator with scales mounted on the floor of the elevator car. A cinder mill for reclaiming purposes is installed on the lower floor of the cupola house, from which a recovery of 500 lb. to 2000 lb. per day is possible. The present pouring equipment consists of Whiting ladle trucks of 1500-lb. capacity each, from which hand ladles are supplied.

The cleaning room, 40 x 100 ft., is built parallel and adjacent to the spur track leading into the upper or office end of the foundry proper. It is thus possible to care economically for dust delivered through pipes on the outside of the unit leading from a dust arresting system inside, by inserting these dust converters in flat cars used for yard refuse purposes. Along one of the 100-ft. walls of the cleaning room are arranged two Sly sand blasts and three Sly tumbling barrels. Eight double-end United States Electric Tool Co. grinders are positioned across the lower end of this room, while finishing and inspecting benches extend along the other long wall. The flooring in the cleaning room is of wooden blocks, but each piece of equipment rests on a concrete foundation.

From the cleaning room a large elevator runs to the pattern storage above. The elevator doors are fireproof and mechanically-operated by the elevator alone, consequently are fool-proof, as well. Patterns are stored on fireproof racks made of steel tubing with diamond plate shelving. These racks are arranged with ample space between them to permit free movement of trucks and employees. The foundry layout does not include a new pattern making shop, which, in this instance, comes under the direct supervision of the foundry superintendent. For the present, patterns will continue to be made in the company's old shop, located some distance from the new plant.

When necessary, castings are transferred by electric trucks from the cleaning room to the galvanizing department adjacent, the wooden block flooring in both units facilitating such work. This galvanizing depart-

Both Cupolas Are 51 Ft. in Height. Their shell diameters are 90 in. and 70 in., respectively

Two Oil-Burning Brass Melting Furnaces Are Installed in a Separate Unit. Each has a capacity of 1800 lb. in 8 hr.

ment is 40 x 100 ft. There are two galvanizing tanks at the lower end, one each side of the unit, set on concrete foundations, of 15-ton capacity each, and seven wooden pickling vats. The latter and the tanks are served by an elaborate overhead track system with generous headroom, on which six one-ton Curtis electric hoists and two hand hoists operate.

Two large washrooms are provided for employees, with accommodations for 150. Both hot and cold water are available, together with shower baths and individual lockers. These rooms are so constructed as to be easily and effectively flushed out.

Inasmuch as the Gilbert & Barker Mfg. Co. property covers 18½ acres, ample storage space for the foundry's raw materials is available.

Drawing as a part of engineering education and the layout and equipment of drafting rooms are to be discussed on Jan. 10 by Prof. Walter H. James, department of mechanical engineering, Massachusetts Institute of Technology, at a meeting of the Providence Engineering Society, Providence, R. I.

Proper Recognition of Employee a Factor in Success of Suggestion System

In connection with the question as to why industrial managers are reluctant to adopt an employee's suggestion system, S. DeHart of the R. K. LeBlond Machine Tool Co., Cincinnati, in a monograph on the subject, states that suggestion systems are an unqualified success when the employee making the suggestion is given proper recognition by the management. This recognition, he adds, may be in the form of money; honorable mention in the factory magazine; or merely a pat on the back. "It is short-sighted policy to receive a good suggestion without giving the person who made it proper credit. Even though the suggestion cannot be used, the employee should be told the reason and encouraged to make other suggestions.

"Not long ago I visited a factory in the Middle West and while there saw a condition which obviously needed improvement and which could have been made by any employee having the slightest mechanical training. I spoke to one of the employees about it, thinking that perhaps it had not occurred to him that such a condition could be improved. He informed me that he was fully aware that the defect could easily be remedied, but had long since stopped suggesting improvements as he had never received any credit for those he had previously made. This company had a large box, labeled 'Suggestions,' placed conspicuously in the shop, but it had long since passed into desuetude for lack of interest of both employee and employer.

As an instance of the proper recognition of employees, the monograph in question mentions one large concern which names machine safeguards after the employee who suggests it. Another company rewards its employees for finding defective links in crane and sling chains, presenting a pocketbook to the employee who discovers one defective link and a gold watch to the employee finding the largest number of defective links.

"There is no question that there is good psychology in having the employee understand that his efforts along these lines are appreciated. It reacts favorably on the employee and also benefits the management."

The recent development in the southwestern oil fields has created such a demand for oil well tools that the Cree-Becker Oil Tool Co., Newark, Ohio, has been obliged to put on a night force to take care of it.

Cement Foundations Are in Readiness for Additional Tumbling Barrels. Where equipment does not stand the flooring is of wooden blocks

Improved Punch, Shear and Bar Cutter

To obviate tilting the piece in making beveling or mitering cuts (inconvenient to say the least in handling large rolled sections), the Buffalo Forge Co., Buffalo, has developed the machine shown in the accompanying illustrations. It is known as the new Buffalo armor-plate No. 26 universal, diagonal-stroke punch, shear and bar cutter. The makers state that after extensive experiment it was found that by inclining the shearing end at an angle mitering could be accomplished with the work held in a horizontal plane, allowing heavy sections to be cut without any lifting.

The machine is designed to take care of every punching, shearing and bar cutting requirement of a steel

over. For smaller beams the special dieblock is required.

The shear capacity includes $\frac{1}{2}$ -in. plates and $3\frac{1}{2}$ x 1-in. flats. Flats 8x5/16-in. or $2\frac{1}{2}$ x 1-in. can be handled with special upper knife. The throat is of special height to allow angles up to 6 in. to be trimmed.

Equipped with standard knives the bar cutter will handle $2\frac{1}{4}$ -in. rounds; 2-in. squares; $6\times\frac{1}{2}$ -in. angles square; $4\times4\times\frac{1}{4}$ angles, 45 deg. miter; and $4\times4\times\frac{1}{2}$, tee-square. With special knives 8-in. I-beams, 18 lb.; 9-in. channels 20 lb.; and 5-in. H-columns, 18.7 lb.; can be handled.

The capacity of the machine for coping is given as 5 to 10 in. beams in flanges; 5 to 9 in. channels in flanges; and up to $5\times5\times\frac{1}{4}$ in. angles square. The width

Universal Diagonal-Stroke Punch, Shear and Bar Cutter. Full front view is shown at left. The arrangement for cutting left-hand miter is shown above and the head for punching in flange is shown below

fabricating shop. The various operating points are located so that these operations can be performed simultaneously. The equipment includes two sets of punch holders and dieblocks for punching beams, channels, girders and H-columns of any size in both flange and web. Special attention is called by the makers to the fact that holes can be punched in any part of the web without turning the section over.

All gears are machine cut. Bearings are of ample proportion, bronze lined, and the flywheel bearing is of the ring oiling type. Power is furnished by a $7\frac{1}{2}$ hp. motor.

The frame is of the Buffalo "armor-plate" type, consisting of two rolled-steel plates with cast steel throat pieces, a construction permitting of considerable reduction in weight as compared with cast iron and steel-frame construction.

The punch has a 24-in. throat, 19 in. high. It is engaged by handle or foot treadle and is provided with a gag, making it semi-floating. The shear is engaged by means of a jaw clutch. The bar cutter is operated by shifting a ram by means of a counter-weighted lever. Stops for shearing angles square on 45 deg. miter are fixed, making it unnecessary to work the angles. The speed of the flywheel is 320 r.p.m. The strokes per minute of the punch and the bar cutter are 20.5; and of the shear, 21.5.

The following capacities are given: Punch, $1\frac{1}{4}\times\frac{1}{4}$ in. or 1x1 in. The standard dieblock and long punch holder punches flat material, the flanges of 8 to 26 in. girder beams; the flanges of 5 to 14 in. H-columns, with straight die; and the flanges of 7 to 30 in. I-beams, with bevel die. The additional dieblock and short punch holder punches flat material; the webs of 8 to 26 in. girder beams; (limited by the throat); the webs of 5 to 14 in. H-columns; and the webs of 5 to 26 in. I-beams (limited by the throat). All of the foregoing can be punched without turning the beams or columns

of the coping tool is 1 in. The capacity for 90 deg. miter notching is $3\frac{1}{2}\times3\frac{1}{2}\times\frac{1}{4}$ -in. angles.

Working Force Reduced

The Chicago, Milwaukee & St. Paul R. R. materially reduced its working forces on Dec. 17. At the seven shops of the road, 12,000 men were laid off. A 10 per cent reduction in the forces maintained at 400 roundhouses was made. About 50 per cent of the clerical employees were also dismissed for an indefinite period. In commenting on the order, H. E. Byram, president of the railroad, said: "Our employees have been asked to work half time and some to cease work entirely until the dull period is over. During the holidays, there is little freight traffic. This season of the year affords an opportunity to reduce forces temporarily. The order will be revoked immediately when business increases."

Sulphur and Oxides in Ordnance Steel*

Comparison of Open-Hearth and Electric Practice —Lower Sulphur Insures Superior Tough- ness—Details of Methods at Charleston Plant

BY WILLIAM J. PRIESTLEY

IN the manufacture of gun forgings and other steel parts that, in service, are subject to sudden high stresses and shocks, it is desirable to use steel possessing the greatest toughness and ductility possible without sacrifice of strength. In order to obtain this, it is necessary to procure steel that shows the highest possible elongation and reduction of area without lowering the tensile strength and elastic limit. Proper heat treatment of the steel can control this condition within certain limits. When heat treatment has failed to produce the desired results, metallurgists have used steels containing molybdenum, zirconium, vanadium, chromium, tungsten, etc.

The purpose of this paper is to describe a method by which these desired physical properties may be procured, by the elimination of certain impurities that in-

Fig. 1—Acid Open-Hearth Steel, Left, Unetched, $\times 25$. Right, Unetched, $\times 200$, Both Reduced About One-Third. This represents a longitudinal section taken from an acid open-hearth steel forging 11 in. in diameter, 28 ft long, $7\frac{1}{2}$ -in. bore, weighing 6000 lb.

The carbon was 0.35; manganese, 0.68, silicon, 0.240; phosphorus, 0.040; sulphur, 0.053, and nickel 3.00 per cent. The physical tests (given in detail in the paper) show normal tensile strength and elastic limit but poor elongation and reduction of area, although meeting the specifications.

The forging was given annealed at 1600 deg. Fahr., rough machined and quenched at 1450 deg. Fahr. and drawn to 1200 deg. Fahr.

herently exist in steel made by the open-hearth process, and without the use of expensive alloys.

Design of Gun Forgings

In the manufacture of gun forgings, a certain elastic limit is fixed by the designer, and the walls of the gun are made of the proper thickness, allowing a suitable factor of safety for the high stresses and sudden shocks that occur during gun firing. The elastic strength of the gun is about 1.4 times the stress set up at any point along the bore of the gun during firing with the maximum powder charge.

As the stresses set up in the walls of the gun during firing are mostly "tangential," all physical tests

are taken in this direction, or transverse to the direction of flow of the metal in forging. Furthermore, test bars taken across the grain of the metal will more frequently expose defects and foreign inclusions in the steel than will bars taken in the direction of flow of the metal in forging. Impurities in the steel will also be more readily detected by transverse test bars.

With a fixed tensile strength and elastic limit, a steel with higher elongation and reduction of area is more desirable for service where sudden stresses and great shocks are encountered. The high elongation denotes ductility and the high reduction of area denotes toughness.

Results Obtained with Electric Steel

Some interesting results were obtained recently in the manufacture of heavy ordnance forgings at the U. S. Naval Ordnance Plant, South Charleston, W. Va. The steel was made by the duplexing process, in which cold charges of pig iron and scrap were melted in a 75-ton basic open-hearth furnace, where the dephosphorizing was done, and subsequently the deoxidizing and desulphurizing was done in two 40-ton basic-lined electric furnaces. A comparison of the physical results obtained from forgings made by this process with similar forgings made directly in an acid open-hearth furnace at the works of one of the leading industrial steel plants, noted for high-grade open-hearth steel, shows that the steel with the lower phosphorus and sulphur has the greater toughness and ductility. Transverse tensile test bars from electric steel, though having the same tensile strength and elastic limit as the bars from the open-hearth steel, have a much greater elongation and reduction of area.

The results given in the table were obtained on tangential tensile test bars. All forgings received a green annealing before machining; after machining they were quenched and drawn. The first impression on comparing these results is that the higher elongation and reduction of area are due to the low phosphorus and sulphur, as shown by the chemical analysis; all the other elements are approximately alike.

Effect of Phosphorus

It would be difficult to draw any comparison between the open-hearth and electric steel in regard to the phosphorus content. This element is in solid solution with the iron as a phosphide and the percentages are too small in both the open-hearth and the electric steel to denote any difference even with a microscope. The lower phosphorus in the electric steel might have a slight effect on the elongation, due to producing a somewhat smaller grain and decreased brittleness in the steel.

Effect of Sulphur

It has been stated by a recognized authority on the manufacture of steel that "the effect of sulphur on the cold property of steel has not been accurately determined but it is certain that it is unimportant. In common practice, the content varies from 0.02 to 0.10 per cent. and, within these limits, it has no appreciable influence on the elastic ratio and the elongation or the reduction of area." This statement probably relates to commercial steels tested longitudinally. In this case the sulphur, in the form of manganese sulphide, has been drawn out into thin shreds in the direction of forging or rolling and is not so easily noticed in the results of longitudinal test bars as it would be in the case of transverse bars. With the overbalancing

*Abstract of a paper to be presented at the February, 1922, meeting of the American Institute of Mining and Metallurgical Engineers in New York. The author is steel superintendent U. S. Naval Ordnance Plant, South Charleston, W. Va.

amount of manganese present in all the steels referred to in this article, probably no iron sulphide is present in the steel for none of the ingots showed any signs of tearing during forging. Steel containing iron sulphide is known to tear in forging and is termed "hot short" by steelworkers. Manganese sulphide has been described as being present in the ingot in the form of small globules between the grains of the metal. Having about the same fusing point as the metal, these inclusions become equally plastic when the ingot is heated for forging and are drawn out into long thin shreds—just as slag is drawn out in wrought iron. If, however, the amount of manganese sulphide present is not enough to form these globules, these shreds will not be developed in forging and transverse test bars will show as good results in elongation and contraction as longitudinal bars.

The following test bars were taken from a piece of steel resembling that shown in Fig. 3. Two of the bars were drilled longitudinal with the forging and the other two tangential. They were given exactly the same heat treatment, quenched at 1425 deg. Fahr., and drawn at 1200 deg. Fahr.; the results were as follows:

	Tensile Strength, Lb. Per Sq.	Elastic Lim. Lb. Per Sq.	Elongation, Per Cent	Reduction of Area, Per Cent	
Tangential..	111,500	55,500	21.3	44.5	Fracture
Tangential..	108,500	58,000	20.9	40.2	Silky lippled
Longitudinal	109,600	58,500	24.1	55.8	Irregular and woody
Longitudinal	109,400	59,700	24.1	56.3	One-half cupped silky
					Three-fourths cupped silky

It will be noted that the tensile strength and elastic limit are practically equal in the tangential and longitudinal bars, but the non-metallic inclosures in the steel caused the tangential bars to show a lower elongation and lower contraction than the longitudinal bars.

Table of Tangential Tensile Tests of Various Sized Gun Forgings of Open-Hearth and Electric Steel

	Phosphorus, Per Cent	Sulphur, Per Cent	Nickel, Per Cent	Tensile Strength, Lb. Per Sq. In	Elastic Limit, Lb. Per Sq. In	Elongation, Per Cent	Reduction in Area, Per Cent

*These ingots were made by a private industrial plant during the war.

The results in each case represent the average of 15 to 40 bars from 5 to 10 forgings.

Effect of Oxygen

There is nothing in the usual chemical analysis to show how much oxygen is present in steel. It exists in small amounts in even the best steel and has bad results. In large amounts, it produces tearing during forging or rolling, and when cold is brittle under shock. If present, it is probably in the form of iron and manganese oxide and silicates. Oxygen is most prevalent in basic open-hearth steel. In the acid open-hearth furnace a more effective reaction between the slag and the steel tends to deoxidize the steel more thoroughly. This cannot be done completely on account of the air present in the acid open-hearth furnace.

A condition exists in the basic electric furnace which cannot exist in the basic or the acid open-hearth furnaces. With a reducing atmosphere in the furnace, it is possible to form a calcium carbide slag free from metallic oxides; with constant rabbling of the bath, any oxides in the steel will rise to the slag, where they are reduced by the carbon present. The iron and manganese are returned to the bath, and the resulting carbon monoxide is liberated to the atmosphere of the furnace. Unless the slag and bath are free from oxygen, it would be impossible to maintain a carbide slag; and unless the slag and bath were thoroughly deoxidized, it would be impossible to retain the sulphur in the slag as calcium sulphide.

Hence, the conditions that bring about the elimination of sulphur from the steel guarantee that oxides and other metallic impurities have also been eliminated. This is demonstrated in the case of the last two forgings in the table. While the forgings were made by the electric refining process in different steel plants, the test bars of steels containing the higher sulphur, show no better results than the forgings made by the acid open-hearth process. The photomicrograph of the

Fig. 3—Electric Steel with Low Sulphur. Left, Unetched, $\times 25$; Right, Unetched, $\times 200$, Both Reduced About One-Third. This represents a longitudinal section taken from a low sulphur electric steel forging 11 in. in diameter, 28 ft. long, 7 1/4-in. bore, weighing 6000 lb.

The carbon was 0.28; manganese, 0.74; silicon, 0.140; phosphorus, 0.011; sulphur, 0.006, and nickel, 2.81 per cent. The physical tests (given in detail in the paper) showed superior results, particularly on tangential bars.

The forging was green annealed at 1600 deg. Fahr., rough machined and quenched at 1450 deg. Fahr. and drawn to 1190 deg. Fahr.

electric steel with high sulphur, Fig. 3, reveals more inclosures than the electric steel with low sulphur.

Photomicrographs of the Two Steels

Photomicrographs have been taken of bars picked at random from each of the three classes of steels described. The polished surface of these bars was parallel to the direction of forging. One set of photomicrographs was taken at 25 diameters, so as to include as many inclosures as possible and to show their distribution. A second set was taken at 200 magnifications, to show the formation of the inclosures. It will be noted that the non-metallic inclosures in the steel with low sulphur and highest elongation and reduction of area are smaller than in the steel with higher sulphur content and the lowest elongation and reduction of area. All the inclosures in the low-sulphur steel seem to be of the same kind, whereas, in the acid open-hearth and electric steel with higher sulphur, there are two types—the small round ones and those that were elongated and drawn out in forging. The light colored elongated inclosures in the acid open-hearth steel are

probably a mixture of manganese sulphide, oxides and silicates.

Manufacture of Steel at the Ordnance Plant

From the foregoing physical results and substantiating data, it is evident that the presence of sulphur, oxides, and other non-metallic inclusions are detrimental to the ductility and toughness of steel. Where the best quality of steel is required, it is necessary to keep these impurities to a minimum. The basic open-hearth furnace eliminates the phosphorus but only slightly reduces the sulphur; the oxides must be eliminated by the addition of deoxidizers, such as ferromanganese, ferrosilicon, aluminum, etc., which are sometimes added to the open-hearth furnace and rabbled after the air is shut off but more frequently are added to the metal in the ladle. If added in the ladle, the reactions are incomplete and the products of combustion remain suspended in the steel, forming harmful non-metallic inclusions.

Gun forgings and other ordnance material, where transverse tests are required, have never been successfully made from basic open-hearth steel. The bars generally fail in elongation and reduction of area tests, because of the presence of these inclusions. They generally break with a laminated and woody fracture.

The acid open-hearth furnace is better for making steel free from oxides and non-metallic impurities, and ordnance forgings have been obtained from acid open-hearth steel. While neither phosphorus nor sulphur can be eliminated in this furnace, the amount of these impurities may be kept down by the selection of high-grade scrap and pig iron. The oxides may be largely eliminated by the effective reaction between the slag and the steel.

The method of making steel at the U. S. Naval Ordnance Plant aims for the elimination of phosphorus, sulphur and oxides. The metallic charge of the open-hearth furnace consists of 40 per cent basic pig iron and 60 per cent miscellaneous scrap, including turnings, crop ends, etc., up to 8 per cent of limestone is added with the charge and sufficient ore to lower the carbon to approximately 0.20 to 0.25 per cent, which is slightly below the amount required in the finished steel.

The average analysis of the final slag taken from the open-hearth furnace on 19 consecutive heats just before tapping is as follows:

SiO₂, 15.43 per cent; FeO, 19.27 per cent; Al₂O₃, 3.66 per cent; MnO, 8.02 per cent; CaO, 45.02 per cent; MgO, 6.37 per cent; P₂O₅, 1.80 per cent; S, 0.031 per cent.

The average analysis of the steel prior to tapping these same heats was as follows:

Carbon, 0.23 per cent; manganese, 0.26 per cent; silicon, 0.010 per cent; phosphorus, 0.007 per cent; sulphur, 0.015 per cent; nickel, 0.66 per cent; chromium, 0.00 per cent.

After it is tapped from the open-hearth furnace into a 75-ton ladle, the steel is teemed through a 2½-in. nozzle into two 40-ton basic electric furnaces for deoxidizing and finishing. Usually 2 lb. of 50 per cent ferrosilicon and 3 oz. of aluminum for every ton of steel tapped from the open-hearth are added to the ladle, to take up any oxygen present, which might lower the carbon content while the steel was in the ladle.

An average analysis of the slag left in the ladle from the nineteen heats, after teeming into the 40-ton furnace was as follows:

SiO₂, 17.27 per cent; FeO, 18.32 per cent; Al₂O₃, 5.75 per cent; MnO, 7.84 per cent; CaO, 42.79 per cent; MgO, 8.15 per cent; P₂O₅, 1.65 per cent; S, 0.028 per cent.

The average analysis of the metal as teemed into the electric furnaces from the open-hearth on the same heats was as follows:

Carbon, 0.20 per cent; manganese, 0.23 per cent; silicon, 0.037 per cent; phosphorus, 0.007 per cent; sulphur, 0.016 per cent; nickel, 0.67 per cent; chromium, 0.00 per cent.

A comparison of the steel analysis will show that the silicon increased slightly; also, that there was a slight drop in carbon and manganese while the steel was in the ladle. The average phosphorus content of the charge into the open-hearth was about 0.08 per cent, because of the comparatively low phosphorus in the crop ends.

After teeming the molten open-hearth steel into the 40-ton electric furnaces, a new slag is made up of burned lime, fluorspar, and ground coke. This represents, in weight, about 8 per cent of the metal charged and is added from time to time, depending on the condition of the bath and the consistency of the slag. The operation from now on is a deoxidizing one. Under normal conditions the bath is held from 3 to 5 hr. in a reducing atmosphere.

The finished steel on six heats showed the following analysis:

Carbon, Per Cent	Manganese, Per Cent	Silicon, Per Cent	Nickel, Per Cent	Phosphorus, Per Cent	Sulphur, Per Cent
0.32	0.71	0.250	0.36	0.022	0.009
0.36	0.74	0.241	3.03	0.013	0.008
0.29	0.74	0.238	2.78	0.010	0.007
0.35	0.71	0.200	0.31	0.013	0.008
0.38	0.67	0.210	2.97	0.010	0.008
0.30	0.78	0.215	2.83	0.013	0.010

The low sulphur in the final slag denotes the possibility of removing a greater amount from a steel of higher sulphur content from the open hearth. This would result from using a lower grade of scrap and pig iron with higher sulphur content in making up the charge for the open-hearth furnace. This might occur

Fig. 3—Basic Electric Steel Made During the War in a Private Industrial Plant; Left, Unetched, X 25; Right, Unetched, X 200, Both Reduced About One-Third. This represents a longitudinal section taken from a basic electric steel forging 9 in. in diameter, 28 ft. long, 5½-in. bore, weighing 4000 lb.

The carbon was 0.41; manganese, 0.48; silicon, 0.168; phosphorus, 0.026; sulphur, 0.029, and nickel, 2.60 per cent. The physical tests (given in detail in the paper) show results inferior to the other electric steel, particularly in ductility.

The forging was green annealed at 1600 deg. Fahr., rough machined and quenched at 1450 deg. Fahr., and drawn at 1220 deg. Fahr.

in plants where miscellaneous scrap is purchased in the open market and where crop ends are not so low in sulphur as those at this plant.

[A discussion of the reactions involved is given in the original paper.]

Conclusions

The manufacture of ordnance forgings from electric steel is not an innovation. It was tried, during the war, in a number of plants. Some of these plants were not as successful as others, probably because the managers were not sufficiently experienced in the many other phases of manufacture necessary in the making of ordnance forgings.

Steel made in an electric furnace will not be of the best quality unless all operations and reactions are performed completely and satisfactorily. Electric steel with its greater freedom from oxides and non-metallic impurities is more uniform, more homogeneous and more dense than ordinary open-hearth steel, and if it is cast at too high a temperature or chilled beyond a certain point in the mold, incipient cracks will develop. These minute cracks are radial and are most frequently

found near the center of the ingot or forging. Numerous electric steel plants working on ordnance material, during the war, were troubled with these defects, which from their physical appearance in test bars were called "snow flakes."

A diversity of opinion has always existed between the leading ordnance steel plants regarding the method of teeming steel into the molds. Some have consistently adhered to bottom pouring while others have claimed better results from top pouring direct, or through fun-

nels or boxes. The method apparently makes little difference if the steel is placed in the mold at the proper temperature and has been properly cleansed before teeming. Top pouring direct obviates the danger of getting runner brick into the ingot, which frequently occurs in the case of bottom pouring. It also obviates the danger of sand washing into the molds with the metal from the funnel or box. Bottom pouring will give a better surface on the ingot and for some purposes may be more desirable.

FRICITION IN ROLLING MILLS*

Effects of Proper Lubrication Shown in Reduced Power Losses

Increased production as high as 1½ per cent has been secured [under proper lubrication] with reductions of 10 to 12 per cent in the power necessary to drive the mill. In straight mechanical engineering practice, increasing the speed of the mill to secure greater productiveness must always be accompanied by forced increase of power. Forcing machines to operate at higher speed, by changing the size of the pulleys or even by putting dressing on belts so that they will have greater traction, always places an extra load on the main engine. In lubrication engineering, however, the savings are all made up of reductions of losses of friction and resistance, and of the loss or slippage in belt transmission.

Illustrating an extreme case of friction losses, a test on a 10,000-hp. reversing rolling mill engine in Germany is cited. It is only necessary to say here that lubrication of this large unit, as found, was representative of conditions which existed in steel mill practice some years ago, and unfortunately are sometimes found to-day. Changing the manner and method of lubrication gave the following results:

Friction Losses				
Original r.p.m.	44.7	56.4	88	88
Original I. hp.	485.88	725.98	1,239.50	1,239.50
Later r.p.m.	42.8	57	79	88
Later I. hp.	148.49	178.72	224.39	249.95
Reduced I. hp.	337.39	547.26	952	989.66
Per cent	69.4	75.4	76.03	79.84

Analyzing these figures, it is seen that the original method of lubricating this unit gave results which approached the laws of solid friction; that is, while the surfaces were not apparently actually in contact, there was interspersed between them material of such a heavy nature that the resistance was so great as to approach the resistance of solid masses working upon themselves. As soon as lubrication was changed, the condition approached that given by consideration of the laws of fluid friction. It is, of course, quite impossible to secure, in a unit of this kind, either purely solid friction or perfect fluid friction. This test, however, indicates quite clearly a possible near-approach to each of these conditions, and represents what takes place in an extreme degree when lubricants are used that are entirely unsuited.

In this particular case the great resistance in the engine itself was reflected in the difficulty of handling the reversing levers. The reversing was done by auxiliary steam cylinders as well as by hand levers. It required a full opening of the throttle to the auxiliary cylinder and all of the power possible for one man to exert on the hand levers. After the change in lubrication was made, only partial opening of the throttle to the auxiliary cylinders was necessary, and the men operated the hand levers with the utmost ease. Further, it was observed and noted by the operators that the speed of the entire mill was increased. The engine was handled very quickly on the reverse, and would get up speed in a fraction of the time formerly required, and this mill was put from an ordinary,

average production unit to where it would make production records.

In this case all of the various rules shown in lubrication of spindles applied, as far as general lubrication was concerned. The lubrication of the steam cylinders, however, was handled through a new set of factors. The change which was made, and results obtained, in reducing the load of this part of the unit were entirely due to securing a better distribution of the lubricant, through having it properly atomized and carried with the steam where it could be spread upon all the surfaces with which the steam came in contact; whereas formerly large quantities of a heavy lubricant, not entirely suited for the work, were forced on the surfaces some seconds after the machine was placed in motion, and this oil would be worked back and forth on these surfaces in that form, resulting in much fluid friction. The oil fed in this manner would not spread to the upper part of the cylinders, which were undoubtedly, in consequence, operating metal to metal. Of the total 1250 hp. friction in this unit when it was turning 88 r.p.m., at least 50 per cent would be charged to cylinder and valve lubrication; the balance to the main bearings, pins, guides and connections.

The New Way to Success—A New Year's Address

The following is in part a New Year's address given before the employees of the Chapman Engineering Co., by William Brewster Chapman, president:

The old way of attaining success was by taking *advantage* of others. The new way is by taking *thought* of others. The psychology of success is the psychology of human brotherhood. The most successful companies of the future will be those that express the most sympathetic human understanding, thus insuring the best team-work and producing the most power with the least friction.

The first step in success is co-operation and co-operation starts with tolerance. The best thing I've heard on tolerance was from a modern minister who said to his congregation "Leave off trying to make other people like yourself; one's enough." It's novel advice from the pulpit, but it's good.

Next to co-operation comes "Iep." It can be kept alive only by exercise, play, good food and a happy state of mind. Important as it may be what food we eat, of vastly more importance is the state of mind in which it is eaten. Joy is a great creative power, it is the keynote to a successful life. Act as though you were glad to be alive and the response will be a new realization of life itself.

My final suggestion is that if you want to get on, you must study more. A vast amount of special information is quite as necessary as special experience. If you neglect either one you impose a limit on your future.

The Surface Combustion Co., Inc., industrial furnace engineer and manufacturer, 366-368 Gerard Ave., Bronx, New York, have been awarded the contract for an automatic heat treating furnace to be installed at the naval ordnance plant, South Charleston, West Va. This is a furnace for heat-treating 16 in. armor piercing shells as per Navy Department schedule and specifications 8996 opened Nov. 22, 1921.

S. L. Fuller, chief engineer, John F. Casey Co., Pittsburgh, was the speaker at the regular monthly meeting of the Engineers' Society of Western Pennsylvania, at the William Penn Hotel, Pittsburgh, Tuesday evening, Dec. 20. His subject was "Construction of the Monongahela River Bridge at Fairmount, W. Va." This bridge is of reinforced concrete with three 250-ft. arches.

New Horizontal Boring Machine

The Universal Boring Machine Co., Hudson, Mass., has placed on the market a new horizontal machine designed primarily for railroad shop and heavy work in general. It is offered as incorporating several features of improved design.

A conspicuous departure from the usual design is in the construction of its wide bed with three flat ways. The front and center ways serve as guiding surfaces, and the one at back supports the long carriage and correspondingly long and heavy standard table, the latter being 30 in. wide and 63 in. long. The machine derives its name, the original Tri-Way universal (horizontal) boring machine from this bed. The bed is rectangular and is so ribbed and braced, it is said, that even a slight degree of spring is prevented if the machine is not placed on a good foundation and properly leveled.

Large overhang on the table is eliminated, the electric motor and gear box, usually supported on brackets or overhanging, being embodied in the new machine. The generous width of the bed is intended to support the overhang of the work as well. The bed is also designed to accommodate the coolant system, the top sloping to the head end and the coolant running into a settling tank concealed in the end of the bed. From the settling chamber the coolant overflows into another tank, from which it is pumped direct, from the driving motor, to the work. In addition, the bed is provided with chip chutes from which the chips can be removed at the back of the machine.

All of the working mechanism is contained in the bed in two trays in one box, readily accessible in case any repairs are needed. The lower tray contains the speed mechanism, and the upper the feed gears. In the bottom tray the gears run in a bath of oil, the tray being provided with exterior oil gages as well as drain plugs. Oil is forced into the upper tray by the action of the gears in the lower tray. All changes are made on the sliding gear principle. The operation of the speed and the feed gears are identical, there being three levers arranged in a horizontal line for each tray, for locating speeds and feeds and for operating same.

The starting and stopping lever, shown in front of the bed, is within easy reach of the operator's right hand. All levers are provided with ball handles. Both the feed and the gear mechanism is arranged in geometrical progression, a proper ratio of speed and feed for any kind of work being thus assured. There are twenty-four spindle speeds with a range of approximately 7 to 285 r.p.m., and twelve feeds, in either direction. Milling feeds run from $\frac{1}{4}$ in. to $5\frac{1}{4}$ in., and boring feeds from $\frac{1}{4}$ in. to $2\frac{13}{16}$ in. per minute. The driving gears are provided with a friction safety clutch, which can be adjusted to a certain horse power; which when reached, causes the clutch to slip out of place thereby releasing gears from excessive strain. All feeds are equipped with automatic stop motion.

In the company's other boring machines a rear post with the box travel in the center has been used, and more or less difficulty has been experienced in applying attachments on certain kinds of work. In the new machine the rear post is constructed along the same lines as the head, the box being on the side and having two bearings, as against four heretofore. The screw rod for raising and lowering the box in the old type of machines, is in one side of the rear post, whereas on the new machine it is in the center, thereby giving greater strength and accuracy. The compensating nuts for taking up wear in the elevating screw are shown at the

upper end of the screw. The beam post is in two parts, consisting of the base, which never need be taken from the bed, and the post itself, held in place by four bolts and two pins, and easily removable. A ring is provided in the top to facilitate removal of the post by hoist.

The head is simple in design, and is similar to the head on the company's No. 3 A machine. The new head, however, has a reversing lever for the boring bar, and a lever for throwing in the high or the low speed gear for the boring bar. The head rests on two ways having extra wide wearing surfaces.

The bar carrier on the bar is adjustable throughout and is equipped with ball bearings. The forward bearing in the spindle has an adjustable take-up sleeve and is lined with felt to assure continued clearance from dirt. The diameter of the main boring bar is $4\frac{1}{4}$ in.

The Front and Center Ways Serve as Guiding Surfaces, the One at Back Supporting the Carriage and Table

The taper hole in the main boring bar is a No. 6 Morse. The automatic travel of this bar is 30 in., but by resetting it can travel 60 in. and the length of the bar is 110 in. The power cross feed to the table is 48 in. and the power vertical feed to the head 30 in. The maximum distance from the table to the center of the bar is 30 in.

The machine occupies a floor space of 17 ft. by 9 ft. 5 in., is 8 ft. high and weighs approximately 20,000 lb. It is driven by an 18 in. x 4 in. pulley drive having 230 r.p.m. It can be driven either by belt or by motor.

Presentation to A. N. Flora

In recognition of his services during the past five years as president of the Western Sheet and Tin Plate Manufacturers' Association, A. N. Flora, vice-president in charge of sales of the Trumbull Steel Co., Warren, Ohio, was presented a chest of silver Dec. 23 by representatives of the organization. The gift consisted of a set of flat ware and a tea service. Charles B. Cushwa, general manager of the Brier Hill Steel Co., Youngstown, made the presentation, as chairman of the special committee handling the event. Other members of the committee were W. W. Lewis, general superintendent of the Falcon Steel Co., Niles; Warren F. Perry, assistant to the president of the Brier Hill Steel Co., in charge of industrial relations; D. R. Fithian, a superintendent of the Sharon Steel Hoop Co., Sharon, Pa.; L. E. Jurey, assistant to the second vice-president of the Republic Iron & Steel Co., Youngstown, and James H. Nutt, of Youngstown, for many years secretary of the association.

Electrification of Steel Plant Railroad

Difficulties Include Protection of Third Rail from
Hot Metal Spills—Saving in Cost 50 Per Cent
—Investment Offset by Low Operating Cost

BY R. B. GERHARDT*

ELECTRIFICATION of the steel plant railroad probably offers the largest field for development of any existing to-day in our plants, and should carry attractive possibilities. Most of our plants use to some extent electric locomotives or motor cars, but this use has been limited to some particular piece of transportation, such as handling hot coke from the coke ovens to quenchers and screening plants, or handling hot ingots from soaking pits or heating furnaces to the mills. In all these cases great benefit results over steam operation, but it is the scope of this paper to consider the complete displacement of the steam locomotive and do all transportation and shifting with electric locomotives, which in the larger plants approximates regular railroad yard operation.

Electrification of main line railroads in this country has, in general, been for special purposes, such as to relieve congestion or for terminal work. Only a very few roads have electrified with the view of handling general freight and passenger traffic.

In practically all cases where roads have been electrified, a considerable economy of operation has resulted, and in all cases the electrification has permitted more dense traffic. Considering the electrification of steam railroads in general, the following items as regards economy of operation, in addition to the fixed charges on any investment undertaken, have to be considered:

Fuel and other operating materials.
Repairs.
Operating labor.
Locomotive depreciation.
Hostler or station service.

Fuel

Under this item the greatest saving can be shown in yard service, due to the fact that the steam locomotive in yard service is idle a much longer time than in any other class of service, and during this time the losses, figured back into fuel, are very considerably greater than with the electric locomotive, particularly where the energy for such electric locomotive is obtained from a general system of power. It has been pointed out also, under this heading, that there is no creeping paralysis gradually impairing the efficiency of the electric locomotive, until temporary relief is obtained through frequent boiler washings and shifter house tinkering, as the efficiency of this unit remains very nearly constant over the entire life of the equipment.

In addition to the above, the steam locomotive efficiency gradually drops off from wear in the piston rings, piston and cylinder walls. With electric operation, however, there are some chances of inefficient operation, due to transmission, distribution and track bonding losses, and it is essential that as careful inspection be given these points as is given the locomotive itself. From results obtained by the New Haven Railroad it has been shown that for every 106.8 lb. of coal required by a steam locomotive in yard service, 38.3 lb. of coal will do the same work after electrification.

This gives a ratio of 36 per cent for this class of service, but for yard work recent tests have shown that this ratio drops to 18 per cent, not taking into account coal lost in the steam locomotives by banking the fires.

With electric locomotives receiving their energy from a central power system, the cost of electric power

has to be compared with the cost of fuel for the steam locomotive. However, there are no coal and ashes to be handled; likewise, in the case of yard service no water. There is, however, some operating material, such as oil, grease and sand, required in both cases, but the items of oil and grease are much less with the electric locomotive. Along with the elimination of fuel, ashes, and water, there can be discarded, in favor of electrification, the plants required to handle these materials.

Repairs

Under this item the fundamental difference between the two classes of locomotives is the length of time required to make major repairs, except possibly in the cases of turning tires and painting. Spare parts can be so easily and quickly substituted in the case of the electric locomotives, that the time for so doing will greatly overbalance that required for most repairs on the steam locomotive. An armature, motor, gear or controller on the electric locomotive can almost be changed in the time required to cool down and empty a locomotive boiler safely for boiler repairs, not to speak of engine cylinder repairs.

With electric operation, where power is taken from the general power system, the cost of additional apparatus required for supplying current to electric locomotives, of course, has to be taken into account; likewise, an item under repairs to be considered, which does not enter into steam operation, is the maintenance of transmission, distribution and contact line systems. With electric locomotives, however, there are no restrictions imposed by outside boiler inspection. The following figures indicate the locomotive repair cost for main line freight service:

	Steam Mallet	C. & M. & St. P. Electric
Weight on drivers.....	240 tons	225 tons
Cost repairs per mile.....	60c.	14.65c.
Cost repairs per 100 tons locomotive weight on drivers.....	25c.	6.52c.

Operating Labor

In general yard work the train crews under electric operation do not differ from those under steam operation, except that the wages of the man taking the place of the fireman are usually somewhat less. For steel plant operation considerable additional economy can be effected as follows:

Each of the various departments, such as the coke ovens, open-hearth and mills, having considerable local shifter service, would be supplied an electric locomotive of its own to take care of such service, and the operating crews on these locomotives could be one man less than on locomotives in general service. These department locomotives would receive cars at a certain specified point from the yard department, deliver them to their destination in their own department, and return empty or loaded cars to the designated point again, for outbound or interdepartment handling by the yard department.

Locomotive Depreciation and Retirement

In the case of steam this is at an appreciably higher rate than in the case of electric operation. It is generally conceded that the life of a steam locomotive averages between 15 and 20 years, as against the life of an electric locomotive of 25 to 30 years. Substantiating this, I wish to point out that the electric loco-

*Electrical superintendent Bethlehem Steel Co., Sparrows Point, Md. The paper was presented at the Chicago convention of the Association of Iron and Steel Electrical Engineers.

†From paper read Oct. 22, 1920, before joint New York meeting of A. S. M. E. and A. I. E. E.

tives on the Baltimore & Ohio tunnel, in Baltimore, are already in their twenty-sixth year of operation.

Hostler or Station Service

With electric operation this service is reduced almost to a minimum. As a matter of fact if the locomotives are so designed as to allow easy accessibility for inspection and oiling, the inspector can look after his work without necessitating the locomotive being sent to the station or shop, and the only requisite in the usual course of operation would be that the locomotive go to a specified point for taking on sand, when the supply is exhausted. No fire cleaning and rebuilding is necessary; likewise, fueling, watering and washing are done away with. The electric locomotive is always ready to run, and pull its maximum load, with the turning on of the current; while it is first necessary, with the steam locomotive, to get up steam pressure to do this work.

In the above conditions the electric storage battery type of locomotive has not been included, for the reason that a greater saving of electric operation over steam is shown by the use of straight electric locomotives only. If the storage battery machine is considered, each of the above items would be increased over straight electric locomotive operation except the item—operating labor.

For yard work the storage battery machine, especially since it can now be secured in fairly large size units, offers attractive possibilities due to the fact that no overhead or rail contact systems are required. But it is not able to withstand such rough treatment as the straight electric machine; it can not maintain continuous service, since during certain periods it must be idle for charging the battery, or else exchanging batteries, and there is a high depreciation on the battery itself. A combination machine using both line contact system and battery may be used, and considerable benefits derived over the straight battery machine.

Practically all of the steel plants use direct current power at a potential of 250 volts, and it is very essential, for simplicity and economy, to use this same voltage for the electric locomotive. In most plants it should be entirely feasible to do this, for the reason that direct current generating or converting apparatus is so distributed that long distances of transmission are not encountered. In many cases the combination of the general plant load, which is highly diversified, due to crane and mill operations, with the railway load will considerably improve the load factor on the direct current apparatus, so that, to handle the yard electrification, it would not be necessary to install such apparatus to the full capacity required for this work.

The principal objection to the overhead trolley in the electrification of steel mill yards is from the interference with the work of locomotive cranes. This machine is so essential in the yard that it is almost impossible to pick out any section of track where the crane will not be required to work, at some time or other. It may be proved, however, that such construction can be used to advantage in the general classification yards, and this is a matter for further study.

One other objection to the overhead trolley is that it does not lend itself very readily to heavy operation at as low a voltage as we propose to use, and we, therefore, feel that the most satisfactory system would be the third rail. After reaching this conclusion, the first question that naturally presents itself is the feasibility of a third rail in the yard from the following standpoints:

Safety.

Blocking the free passage of switchmen or other employees through the yard.

Danger from material or hot metal spilling or falling on the third rail.

Methods of crossing frogs and switches.

Methods of construction through buildings or special places where conductor rail is objectionable.

Tie-up from wrecks.

Safety

The best answer to the question of safety is to refer to the operation on blast furnace trestles, where we have had electrified tracks with third rail construction

for many years, operating at the same voltage as proposed for yard electrification. Looking over our records during this time, I find that there has not been a single accident from contact with the live rail. There have been accidents on the trestle due to other causes, but none can be attributed to the electrified condition of these tracks.

Two hundred and fifty volts is the common plant voltage which our workmen are thoroughly familiar with, and particularly the yard department employees who have anything to do with locomotive cranes or handling of lifting magnets. If we should go to any higher voltage, then the proposition would be considerably more hazardous.

There are essentially two kinds of third rail contact systems, one using the over-top contact and the other underneath contact. We prefer the latter for steel plant work, due to the fact that it can be better insulated and more substantially protected from material falling into the rail and causing trouble. With this type of construction, it is almost impossible for anyone to come into contact with the live rail, except by getting down underneath the guard on either side and touching the head of the rail, which extends slightly below the guard; whereas, with the overtop contact there is not formed nearly as good a support for the guard and anyone stepping on this guard or anything falling on it is apt to break through and come in contact with the live rail. Also, it is entirely possible to come in contact with the rail from the side toward the track, where it is entirely exposed.

The underneath contact system lends itself more readily to a very close fitting guard, thus taking up considerably less space than the overtop contact rail with guard, and this close fitting guard can be purchased on the market, made up of impregnated insulating material in sectional lengths, which fit the rail exactly and require no supporting straps or brackets. The labor of installing or repairing such a guard is, therefore, reduced to a minimum. Such construction has been in satisfactory use for quite a number of years on the New York Central electrification in New York, also on the Philadelphia Rapid Transit system.

Blocking Free Passage of Switchmen or Other Employees Through the Yard

The type of third rail construction described above makes it very feasible to step over the rail without hazard of shock and without strenuous effort. Also, in crossing the rail, there is no danger in actually stepping on the guard, which will easily support just as much weight as the rail itself. At any point where it is desirable to do so, a gap of approximately 40 ft. can be left in the rail without interfering in any way with operation. Thus at road crossings there will be no difficulty, and at other necessary points such gaps can be allowed.

Where two or more tracks run parallel, the conductors' rails are located toward the inside of these tracks, so as to leave the outside area free of obstructions to the switchmen and brakemen. With electric operation the locomotive has operating control equipment on each side of the engineer's cab, so that he can use either side of the locomotive as desired.

Danger from Material or Hot Metal Spilling or Falling on Rail

With the type of third rail construction described above no material falling on the conductor rail guard will do any damage, unless it is actually heavy enough to cut through $\frac{1}{4}$ -in. impregnated insulation. To do such damage a piece of steel falling from an ordinary flat car would have to weigh between 1000 and 1500 lb.

As regards hot metal spillage, unless the metal should build up a sufficient puddle to burn the railroad ties, no damage would be incurred to the third rail, except in a case where a stream of hot metal might pour direct from a ladle continuously down over the guard, the ladle standing in one spot. Even this would not prevent the locomotive from operating, as the guard only would be burned off, and inasmuch as the trouble would be in a particular spot, repairs would necessitate only renewing the guard at this point.

We should not propose running the conductor rail up alongside of any of the blast furnace cast houses, where hot metal and slag messes often occur, but would stop the rail at the end of the cast house. It would be necessary for locomotives in this class of service to use an idler car, the same as under present operation, to reach ladles standing under pouring troughs.

Methods of Crossing Frogs and Switches

On a general first glance at a steel plant railroad yard, the complicated track system, with numerous switches and cross-overs, would seem to make third rail operation not practical. However, one needs only slight study of the situation to overcome these doubts. On many furnace trestle electrified tracks we have solved these difficulties, and we can easily improve on such systems, as there are considerable difficulties to contend with there, due to spillage of all kinds of raw materials and scrap down over the tracks, which would not be the case in general yard work.

By using four collector shoes, one at each corner of an electric locomotive, and by the use of the side approach conductor rail fitting at switches, it is entirely possible to keep current on the locomotive, even at most difficult track positions. Where gaps must necessarily occur in the conductor rail, it is only a matter of getting the proper distance between collector shoes, to solve the problem.

Methods of Construction Through Buildings or Special Places Where Conductor Rail is Objectionable

It is easy to provide on each electric locomotive a cable reeling device or power driven take-up reel, with about 500 ft. of flexible cable to be used in buildings or special places where conductor rail is objectionable or prohibited. At such places a receptacle should be mounted where one of the train crew could plug in the end of this flexible cable, and the locomotive would proceed on its way to deliver or remove a train from such buildings, as in the case of a locomotive maneuvering in the open-hearth pit, or going into any one of the other plant buildings.

In the open-hearth scrap yard, one track, the running track straight through the yard, would be provided with the third rail, with a guard construction over it, made of steel. The other track up against the scrap pile would not be electrified, but cars would be handled on this track in a train as far as possible, or by poling them from the running track, so as not to make it necessary for the locomotive to run along the track, which is apt to be blocked up with scrap metal. In the cinder dump, the pay-out reel and flexible cable described above would be used on the dumping track, and as regards steam for dumping the cinder ladles, air would be supplied instead from the locomotive, which would be equipped with a reservoir sufficient to handle the cinder ladle dumping cylinders.

Tie-up from Wrecks

The extent to which any section of the yard might be tied up from a wreck causing damage to the third rail depends entirely upon the degree to which the conductor rail system is sectionalized. These sections, in a dense traffic zone, might be slightly less than 500 feet, so that by using the pay-out reel with flexible cable described above, the locomotive could easily maneuver, in case of a wreck, over the dead conductor rail section. The only time the system would be out of power would be long enough to close a circuit breaker and switch in the power house, or any of the sub-stations.

To make a comparison between steam and electric operation on any particular proposition, accurate results require a service data test on one or more of the steam locomotives to be replaced in each class of service. Such a test, lasting three days last February, and made with a 115-ton locomotive having 75 tons on drivers, gives data on a steel mill yard locomotive in typical service of handling incoming and outgoing freight. This work is of a variable nature, as cars are spotted and collected all over the yard.

The heaviest trailing load handled was 1,330.5 tons, while most of the work consisted of considerably lighter shifts. The number of shifts per day is 88,

while the per cent of time idle, lost in throwing switches and making couplings, is only 40 per cent of total time. From comparison with other tests, it has been found that a locomotive working its maximum all day will vary its per cent time lost inversely with its length of shift. The average length of shift on this work was 1,682 ft.

Since the average load was only 199 tons, the trailing load could have been larger, and more work or ton miles could have been accomplished, but the time lost would have remained no less and probably some greater. The total mileage per day averaged 26.6 miles, which gives the average speed per shift at 5.1 mph. The trailing ton miles, which represent the effective work accomplished by the locomotive, were 3,590.4, while the locomotive ton miles expended to accomplish the effect were 3,064. The locomotive ton miles represent 46.5 per cent of the gross or total ton miles.

As the locomotive ton miles are ineffective ton miles, the shifting may be said to be only 53.5 per cent efficient. The tender ton miles averaged 1,010.3, and are the ton miles necessary only to supply fuel to locomotive. Trailing ton miles should be used as a basis for any calculations, since this value is the effective work, hence the amount of coal used to accomplish a trailing ton mile was 1.122 lb.

To give some idea as to what results might be secured after electrification, the figures below represent a case under study for some time past. They give actual steam operation costs averaged over a period of several years, against estimated costs with electric operation:

	Steam	Electric	
		Battery Locomotives	Straight Electric Locomotives with Third Rail
Number of locomotives...	27	27	23
Investment charges, including shop and service facilities, converting apparatus, transmission and contact systems	\$850,000	\$1,220,000	\$1,376,000
Fixed charges per annum	99,300	105,300	164,800
Locomotive depreciation	20,400	163,400	22,700
Fuel or power	116,100	28,000	18,900
Repairs	110,700	36,000	28,800
Operating labor	147,500	89,500	89,500
Station service, including miscellaneous operating material	43,000	16,000	9,400
Totals	\$567,000	\$438,200	\$335,100
Annual saving, compared with steam		\$128,800	\$231,900
Return on investment, in addition to normal interest included in fixed charges		10.5%	16.9%

This proposition covers a steel plant railroad yard having a total of 57 miles of single track. There are 27 steam locomotives ranging in size from 75 tons down to 25 tons, and it is assumed that 27 battery locomotives with extra battery units, or 23 straight electric locomotives, using third rail, would be required to do the same work. For standardization purposes and flexibility of operation it is assumed that electric locomotives would either be 40-ton or 80-ton units, each of the latter being made up of two of the 40-ton machines. This would mean a total of 37 of the 40-ton battery locomotives or 33 of the 40-ton straight locomotives to be considered. The figures given under electrification for investment charges really represent the net cost after an allowance has been made for the salvage value of the steam locomotives displaced.

These figures really show only part of the saving that can be made by electrification. After the yard is electrified (with third rail system) the next step is to equip the locomotive cranes for motor operation, and these machines could work in any part of the yard through the full 24 hr. of the day, if desired. The greatest item of saving in this case shows up in the additional amount of work which can be secured from these units, for with steam operation, present experience has shown that a general average of 50 per cent of the time is lost, due to the cranes having to drop their work and go for fuel or water. In some cases it is true that these items can be secured without any great movement, and in other cases many hours are lost for the same purpose, but in either event it is

true that the cranes cannot continue with their work while taking on these requirements. It is rather hard to figure just what saving can be effected, without making an extensive investigation over quite a period of time, but for the case cited it is estimated that \$70,000 annually would be conservative for an average of ten cranes in operation. This would bring the annual saving in favor of electrification up to over \$300,000, cutting the cost over the present method of operation by almost one-half.

It would appear, therefore, that the general subject of electrification of the steel plant railroad is one which merits investigation and study, and the writer predicts that the electric motor will displace the steam engine on mill transportation systems just as it has in rolling mills.

Light-Weight Portable Electric Drill

A lightweight, $\frac{1}{4}$ in., portable electric drill of the type shown in the accompanying illustration and designed for drilling in metal or wood has been added to the line of the Black & Decker Mfg. Co., Baltimore.

The drill has an aluminum-alloy housing and weighs but 5 lb. It has double reduction gearing giving a no-load speed of 1600 r.p.m. Gears are stub toothed, cut from chrome nickel steel, heat treated and run in grease. Bearings are removable and renewable. The drill is equipped with a pistol grip and trigger switch, with the switch located in the handle to enable close corner work. The brushes can be renewed from the

The Spindle Is Arranged to Enable Drilling to Within About an Inch of Any Obstruction

outside of the case and by removing four screws the motor commutator, switch mechanism, field leads and cord terminals may be exposed. The commutator end bearing of the motor armature is carried in a spider, which is integral with the motor case, keeping the armature in alignment and facilitating inspection and cleaning of the commutator while the drill is running, as the removal of the cover plate does not interfere with the operation of the tool.

A light weight rubber covered cable is supplied and a clamp provided in the handle so that strains on the cable have no tendency to pull the terminals loose from the switch. A 3-jawed chuck, flexible cord and attachment plug are supplied with the tool.

Will Dispose of Hog Island Scrap

Washington, Dec. 27.—With the 110,000 tons at Hog Island the only considerable lot of surplus steel it has on hand, the Emergency Fleet Corporation has begun plans to dispose of this tonnage. It has announced that it will receive bids until Jan. 5, on a private competitive basis, for all fabricated and partly assembled material included in what is known as group 8 at the Hog Island yard. This involves 6,000 tons, of which 95 per cent is built-up members, the remaining 5 per cent being fabricated but not assembled material. The other portions of the 110,000 tons at Hog Island will be sold in groups from time to time.

The steel is to be sold "as is" and no claim for condition or quality will be allowed after the opening of bids. Bids are to be addressed to the United States Shipping Board Emergency Fleet Corporation, Nineteenth and B streets, N. W., Washington.

The National Association of Cost Accountants has inaugurated a drive for 400 new members by March 1, 1922. The organization has local chapters in the principal cities of the United States. The chapters meet monthly to hear papers on cost and accounting problems. S. C. McLeod, 130 West Forty-second Street, New York, is the national secretary and business agent.

Metals for Aeronautics

In the seventh annual report of the National Advisory Committee for Aeronautics, reference is made to the report of the sub-committee on materials for aircraft. Many subjects have been studied, including streamline wire, screw threads, steel strip and light alloys, etc. Some of the difficulties mentioned relate to the effect of vibration, the difficulty or practical impossibility of obtaining proper heat treatment of thin steel sheets or strip on a commercial scale, and certain difficulties in connection with welding.

Progress made during the past year in the development of all metal aircraft has not been altogether satisfactory. The trouble seems to be that, as yet, we have not developed suitable and economical methods of producing and fabricating aluminum alloys. The Bureau of Standards expects to conduct a series of investigations on the rolling and shaping of duralumin for aircraft construction, and has been equipped for this purpose. Heat treatment of the material will also be carefully studied, in connection with the results of cold working. Fatigue tests are to be continued, and vibration tests to be made on various types of airplane, to obtain some idea of the character of vibration to be expected.

A most serious drawback of the present type of airplane is the cost of manufacture and the short life. This cost is excessive, even in quantity production. If construction materials consisted entirely of metal, the parts would lend themselves better to quantity production, longer life would be assured and storage conditions improved.

The committee's estimates for carrying out its program total \$265,000. Additions for publications and the collection, classification and dissemination of scientific and technical reports and data, together with administration of the Washington office, will add \$76,000, making a total for the fiscal year 1923 of \$341,000. This compares with the appropriations for 1921 and 1922 of \$200,000 each year.

Long Range Planning of Public Works

Washington, Dec. 27.—Announcement has been made by Senator Kenyon, chairman of the committee on Education and Labor, that he will attempt to get action soon after Congress reconvenes in January on his bill embodying a portion of the recommendations made by the national unemployment conference. It deals chiefly with long-range planning of public works to overcome cyclical periods of business and industrial depression.

The bill was reported to the Senate last Thursday by unanimous action of the committee following a brief hearing on the measure. Members of the committee are of the opinion that it provides a partial remedy toward offsetting the slumps in employment and giving more stability to the situation.

All witnesses who appeared before the committee gave strong support to the measure. Among them was L. W. Wallace, secretary of the Federated Engineering Societies. Brig. Gen. R. C. Marshall, Jr., former head of the construction division of the Army, now general manager of the Associated General Contractors, pledged the support of that organization.

Portland Cement Production High

Figures of the United States Geological Survey show that the production of cement for the first eleven months of 1921 amounted to 91,734,000 bbl., and shipments to 91,354,000 bbl. This latter figure is about 1 per cent under the record shipments for the first eleven months of 1920, and about 9 per cent greater than the average for the first eleven months of years 1917 to 1921. Production of cement during November, amounting to 8,921,000 bbl., is a falling off from the record figure of October, 10,506,000 bbl., but is about 17 per cent higher than the average November of years 1917 to 1921 inclusive. Production for eleven months was only one-half per cent below the high record of 1920, and is 11 per cent greater than the average.

BRAZILIAN CONDITIONS

W. Vernon Phillips Comments on Situation in That Country as Affecting Our Trade

W. Vernon Phillips of F. R. Phillips & Sons Co., Pennsylvania Building, Philadelphia, who has just returned from a trip to Brazil, comments as follows on conditions there as affecting the demand for American products:

"During a three weeks' stay in Brazil (that is Rio Janeiro and Sao Paulo) I gathered no outstanding impression. I came in reasonably close contact with Brazilians of the better class, English, American and Italian merchants and manufacturers.

"I am most impressed by the evident independence of the Brazilians in so far as foreigners are concerned. They feel sufficient unto themselves as, in fact, they will be in a very short time. Unlike Europeans (except in the case of importers and exporters) they find no need to learn other languages. In this they are like Americans. They have comparatively few visitors and the bulk of the population resides very far from the borders. Curiously, while her neighbors all speak Spanish, the Brazilian with his rather unpleasant Portuguese tongue thoroughly dislikes Spanish and while he can probably read enough of it to understand, he absolutely refuses to read catalogs, letters, etc., sent him in Spanish; in fact, feels quite indignant. Americans endeavoring to trade in Brazil should bear this in mind.

No Color Line

"The population is principally negro, but no color line is drawn and it is difficult to tell what proportion is pure white. This blending of color, however, has not been as serious in its consequences as we regard the possibility in the United States as in a large measure the colored element, given equal opportunity, has arisen to the occasion and many black men occupy most important positions with great credit. However, the rank and file throughout the country are much like our Southern negroes, working only as long as they need money, which is not often. The climate requires but little change in clothing and food is often to be had for the effort of picking it. So that probably the greatest need is emigration of Europeans. Germans are particularly welcomed for their thrift and ambition.

"The next important need is increased railroad facilities tapping the rich lumber, ore, rice and cotton sections, and it is only the lack of capital and the present international depression which prevent this expansion, as the government is ambitious and has very far reaching plans which include the development of water power which they have in great abundance to electrify their railroads and operate their manufacturing, which are extensive, in Sao Paulo and Rio Grande du Sul. This will free them from the yoke of coal which must all be imported, though they do mine a couple of hundred thousand tons of very low grade coal per year.

Shipping Facilities

"The shipping facilities in Rio de Janeiro and Santos are splendid and can take care of a heavy trade movement, Santos for the enormous copper export and Rio for general cargo, but they are also developing an excellent port in the North, namely Ceara which will take care of cotton, cottonseed oil, rice and lumber when finished. Also the banking facilities are adequate; in fact, more than can possibly be properly occupied excepting when business is at its apex. Foreign banks predominate and every country is amply represented. The banks, however, are strong as during the collapse last year only one bank (French) had to close its doors, though many scores of merchants were forced to the wall through the terrific fall in exchange and loss in values.

"The American naturally looks upon the milreis as depreciated currency, but the Brazilians continue to regard it as a unit of value and blame the high cost of the dollar and with certain good reasons. The milreis still has approximately the same purchasing power that it had before the war, wages have not advanced much and a milreis still brings a pound of food and

three of them normally purchased one American dollar, but to-day it requires eight of them, whereas it will buy 1.85 in francs as against 1.75 normally and three lire as against 1.75 normally, though it takes 33 milreis to buy a pound of sterling as against 15 milreis normally. So the pound costs them twice as much and the dollar three times as much, whereas they can buy a larger number of French and Belgian francs and Italian liras than formerly. Thus trade is naturally drawn by the countries whose exchange is most greatly depreciated. Moreover, Brazilians seem to prefer dealing with the Continent. The United States has, of course, suffered severely in reputation from the actions of unscrupulous exporters and indifferent manufacturers during the war, and we not only have to live this down but overcome a natural prejudice also. Present conditions give no opportunity to do this in the bulk of their purchases, as the Belgians, Germans and French can undersell us so greatly that the Brazilian thinks it hardly worth while asking us for prices. However, this will be overcome in time by readjustment in exchange and the Americans should not let up for a moment in keeping before the buying public, as it offers one of the greatest natural opportunities in the world with its great potential possibilities.

Governmental Protection

"One thing will be all important in the development of this trade and that is good governmental protection, particularly for those making long time loans, bond issues, etc., and this protection may have to be in the form of a demonstration of strength—a strong show of naval force will do much more than all the argument in the world with these people who are used to being kept in order by a show of force.

"The political situation is very unsettled and street disturbances are of frequent occurrence. The president is popular and is generally respected, but his proposed successor is very unpopular. They have no fixed parties in Brazil, so the administration always has a very great advantage with its great host of hangers on and petty officials, including the principal railroads, steamship lines, etc., so that the opposition is unorganized, is without authorized leaders and can only voice a protest through street demonstrations and the uncontrolled newspapers. The administration always has the army and police and very effectively controls the opposition. Thus the only effective way of ousting the party in power is to successfully engineer a revolution, which is not as bad as it sounds, as it simply changes those in control, but is pretty sure to result in some loss of life. The present situation will probably be saved by the selection of a third and acceptable candidate but without a revolution the change in the presidency means no change in the control, which is, as usual, held by a few strong men."

Grain Side of Belts More Efficient

Under reasonable shop tension, the flesh side of a leather transmission belt, when placed in contact with the pulley, will average only 50 to 60 per cent as much horsepower as the grain side. At higher tensions the flesh side will do better, averaging from 50 to 100 per cent as much power as the grain, depending on the belt, the tension and the conditions of service. This is the conclusion of the Leather Belting Exchange, Philadelphia, which conducted experiments in the research laboratory at Cornell University.

For more than two months continuous tests were performed. Use was made of five 4-in. single belts, 30 ft. long, of different manufacture. They weighed from 16 to 18 oz. Conditions were standardized. All belts were run long enough before the experiments to insure that they had become thoroughly "run-in."

Illustrating the less degree of efficiency of a new belt, one belt under test transmitted 12 hp. when first put on the pulley at a slip of 1.2 per cent; after five hours running it reached 19 hp. with the same percentage of slip and same tension; at the end of 13 hours it transmitted 24 hp.; after 20 hours, 31 hp., with a slip of 1.6 per cent. According to horsepower tables its scheduled transmission should have been 26 hp.

Double-Head Grinder for Finishing Wrist-Pin Holes in Engine Pistons

A double-head internal grinder designed for finishing wrist-pin holes in engine pistons, but adaptable also to the grinding of holes in opposite ends of long pieces not conveniently handled with a single long wheel spindle, has been brought out by the Bryant Chucking Grinder Co., Springfield, Vt.

The machine, designated the No. 2, resembles in its main features the company's other grinders. Two separated grinding wheel heads, carried on the same wheel slide, operate to grind simultaneously the two holes in opposite sides of pistons. The grinding wheels are dressed by a diamond, absolute duplication in size of both the ground holes being guaranteed. Both wheels grind at the same time. A single motion of the pilot wheel serves to separate the grinding wheels clear of the work, which permits of swinging the wheels back

wrist-pin holes, the plug being of a size to fit the holes before they are ground.

With the piston in place ready for grinding, the wheel heads are swung down in position. To bring the wheels into position for simultaneous operation, it is merely necessary to turn hand wheel "B" shown in the front view. Slide "C" is attached rigidly to slide bar "D". Slide "E" moves longitudinally on the slide bar and is prevented from rotating on the latter by a bar at the rear. This bar allows longitudinal movement between the two wheel head carriers but keeps the wheels in line. This relative movement of the slides is obtained by means of racks which operate through bar "H".

As the wheels are advanced toward each other the crank arm "I" strikes a stop and clamps the slide to the bar in proper position—all this being obtained by one movement of the handwheel. Dropping the lever "J" throws out one rack, the two wheel heads then being operated as a single unit.

Two Separated Grinding Wheel Heads Operate to Grind Simultaneously the Two Wrist-Pin Holes in Opposite Sides of Pistons

out of grinding position and gives ample room for plugging and chucking the work.

Grinding the separated holes in pistons in this manner, at a single chucking of the work, assures absolute alinement of the ground surfaces, it is claimed, and also maintains a maximum length of bearing surface in each hole. Each hole is straight, there being no bell mouth at either end. Both sides of the piston are available for plugging or sizing the holes. The net result of this method of grinding two holes at the same time is to increase production; it is said to give higher accuracy and a piston capable of longer service.

In the illustration of the front view, the wheels are shown withdrawn from the hole preparatory to swinging the wheel head to the rear for gaging or changing the work. In the work fixture, shown at about the middle of the bed, the piston is located in V's and held by a clamp which operates against the inner surface of the piston over its contact points with the V's. The clamp is operated by a half turn of a wing screw. In the body of the fixture there is a ball race which serves as a control for the rotating part of the chuck. The rotating ring is held in place by a ball-thrust bearing which in turn is held in place by a ring. The work is driven from the countershaft by a round belt.

The open side of the chuck with the piston removed, showing the clamp in position for gripping the work is shown in a separate illustration. To locate the piston the skirt is slipped under the clamp. The hand-centering, plug shown, which fits the hole in the closed space of the fixture, is put in place and passed through the

Open Side of Chuck with Piston Removed Showing the Clamp in Position for Gripping the Work. To locate the piston the skirt is slipped under the clamp

Open Side of Chuck with Piston in Place for Grinding. Both sides of the piston are available for plugging or sizing of holes

The wheel traverse when grinding is provided for by a "load and fire" mechanism with reversing stops adjustable to give the desired length of stroke, the same as used on the standard Bryant grinders.

The cross feed is obtained in the manner usual with Bryant internal grinders, by means of handwheel "K" at the front of the machine. This operates against the control plate clamped to an arm on the wheel slide at the back of the machine. The cross feed is utilized also for cross feeding the wheel, when trueing.

The chuck range includes pistons up to 4 1/2 in. in diameter by 4 1/2 in. in length. The work spindle runs at 250 r.p.m. and the drive pulley on the countershaft at 750 r.p.m. The motor recommended is 3 hp. 1720 r.p.m. The weight, with countershaft, is 2300 lb. net and the floor space occupied, 3 x 6 ft.

The Otis Steel Co., Cleveland, is installing at its Riverside plant, complete galvanizing equipment, including sheet galvanizing machines, two galvanizing pots, cooling wheel, pickler, etc., furnished by the Erie Foundry Co.

The American Supply and Machinery Manufacturers' Association has accepted an invitation to meet with the Southern Supply and Machinery Dealers' Association at Birmingham, Ala., April 24 to 26, 1922.

Declaration of Government Policy Expected

Attorney General Daugherty and Secretary Hoover Giving Close Study to Supreme Court Decision in Hardwood Association Case

WASHINGTON, Dec. 27.—Determination of a definite policy by the Government toward trade associations is expected to be reached in the near future as the result of the Supreme Court decision in the case of the American Hardwood Manufacturers' Association. This is based on the statement by Attorney General Daugherty that the formulation of such a policy has been awaiting the decision. He is engaged in studying it carefully and has said that it affords a "clear path" for the conduct of such associations, but has not as yet given it sufficient analysis to announce a detailed policy. In co-operation with Secretary of Commerce Hoover, the Attorney General has for some time been considering the subject, but it was concluded to await the decision before mapping out a program which would provide a safe guide as to the conduct of such association.

Secretary Hoover's Attitude

Secretary Hoover, while attempting no interpretation of the decision, inasmuch as this does not come within his province, has expressed the belief that the Supreme Court's opinion will make it possible to work out a concrete program at an early date. The Secretary does not consider the decision to be so sweeping as do some attorneys who closely followed the case and thinks it will not interfere with co-operation between his department and trade associations. He stated that a survey conducted by the department showed that of the 1700 or 1800 trade associations of the country less than 10 per cent were shown to be engaged in "trade recruiting" in violation of the law.

His view is not shared by those attorneys who consider that the decision has such a range that it destroys the very principles of trade associations as to the handling of trade information, other than that relating to prices. There is no doubt on the latter point, in the opinion of legal authorities. Exchange of price information is held to be clearly in violation of the Sherman anti-trust law. But some of them go much further and maintain that the opinion handed down through Justice Clarke is much more restrictive.

Declared a Misnomer

They point to the following portion of the decision:

To call the activities of the defendants, as they are proved in this record, an "Open Competition Plan" of action is plainly a misleading misnomer. Genuine competitors do not make daily, weekly and monthly reports of the minutest details of their business to their rivals, as the defendants did; they do not contract, as was done here, to submit their books to the discretionary audit and their stocks to the discretionary inspection of their rivals for the purpose of successfully competing with them; and they do not submit the details of their business to the analysis of an expert, jointly employed, and obtain from him a "harmonized" estimate of the market as it is and as, in his specially and confidentially informed judgment, it promises to be. This is not the conduct of competitors, but is so clearly that of men united in an agreement, express or implied, to act together and pursue a common purpose under a common guide that, if it did not stand confessed a combination to restrict production and increase prices in interstate commerce and as, therefore, a direct restraint upon that commerce, as we have seen that it is, that conclusion must inevitably have been inferred from the facts which have been proved.

It is the opinion of some attorneys that the foregoing reaches far beyond the question of price, although leading up to it, and that it implies violation of the law in handling data such as those bearing upon stocks, production, etc., where the figures are used to restrain trade and fix prices. Concession is made that a test will prove that in individual cases there will be shown a marked difference in methods of conducting trade as-

sociations and that many will not come under the ban of the law. Meanwhile, however, there is widespread opinion that until the Government has mapped out a definite policy, many associations will feel so uncertain as to their legal standing in the light of the decision that they may decline to co-operate with the Department of Commerce or engage in any further activities. Despite the confidence they may have, based on their own opinions, as to their legality, it is contended that they will want assurance from the Government before proceeding further.

Favors Trade Associations

The Attorney General himself, in commenting on the decision, said he was unqualifiedly in favor of trade organizations which confined their operations to improving their services to the public, but he stated they would not be permitted to fix prices or apportion territory among themselves, resulting as it does, he asserted, in restricting competition. This plainly is a broad view and it is confidently believed, if left to itself, would mean that the decision would affect a decidedly small percentage of trade associations, as Mr. Hoover claims is the situation. But attorneys are insistent that the decision itself is much greater in its scope than the dealing with prices, apportioning of territory, etc., and think legislation will be necessary to insure the associations of their legality, a view that indicates a policy announced by the Department of Justice might even be insufficient.

The Attorney General proceeded to state that trade associations generally are showing a commendable willingness to confine their activities to the lines broadly suggested by the Department of Justice as in conformity with the law. Where the department's advice has been disregarded, however, it was pointed out, it has been necessary to proceed under the Sherman law. As a matter of fact, there are those who think the decision lacks in comprehensiveness and that consequently it will be necessary to try a number of other cases on their merits, although it is hoped that this will not be necessary and that it may be avoided either by the announcement of a definite governmental policy or through legislation.

It is no surprise, but it is interesting to note the remarks in the majority opinion where it makes a distinction between the exchange of information among sellers only and between sellers and buyers. The decision says:

In the presence of this record it is futile to argue that the purpose of the "Plan" was simply to furnish those engaged in this industry, with widely scattered units, the equivalent of such information as is contained in the newspaper and Government publications with respect to the market for commodities sold on boards of trade or stock exchanges. One distinguishing and sufficient difference is that the published reports go to both the seller and buyer, but these reports go to the seller only; and another is that there is no skilled interpreter of the published reports, such as we have in this case, to insistently recommend harmony of action to prove profitable in proportion as it is unitedly pursued.

Obviously, as was to be expected, the decision does not affect publication of trade information in the lay and class press, nor does it have any bearing upon boards of trade and stock exchanges. Nevertheless the point has its value. This is particularly so because the Department of Justice in its proceedings in the so-called Southern Pine case, similar in many respects to the Hardwood case, made certain lumber publications defendants. The finding of the Supreme Court would indicate plainly that the Government's case as it applies to these publications will fall flat.

Hydraulic Automobile Body Press of 450 Tons Capacity

The Southwark Foundry & Machine Co., Philadelphia, has recently developed an all-steel automobile body press having a capacity of 450 tons. It is shown in the accompanying illustration.

With the intention of providing exceptionally sturdy construction the main ram is located in the lower base, to which are secured the four press columns. One clamping platen and one stripper platen are provided. The stripper platen is heavily made and carries four hydraulic cylinders, which act upon a forged steel plate which in turn carries 60 stripper pins $1\frac{1}{2}$ in. in diameter. These stripper pins project through the clamping platen. The clamping platen is a solid steel casting and is provided with Tee slots. The top platen

The Stripper Platen Carries Four Hydraulic Cylinders Which Act Upon a Forged Steel Plate.

carries eight hydraulic jacks which are used for clamping and which have 5-in. diameter rams with 5-in. stroke. The top platen itself is adjustable to meet conditions of the various size dies which may be employed under the press.

The control of the press is by a single lever operating valve which first admits low pressure to the four jack cylinders and at the same time admits low pressure to the main ram. As soon as the dies come together high pressure is admitted through the steam operating valve, thus completing the work on whatever shape is to be formed in the dies. The clamping cylinders are controlled automatically from a low-pressure filling tank and are capable of standing a hydraulic press of 5000 lb. per sq. in.

The press has a die space of 7 ft. x 5 ft. The minimum vertical opening between the platens is 18 in., and the maximum, 4 ft.

Executive offices of the Engineers' Society of Western Pennsylvania have been removed from the Union Arcade, Pittsburgh, to the William Penn Hotel, also in Pittsburgh.

Michigan Foundrymen's Association

KALAMAZOO, MICH., Dec. 27.—Foundries in Michigan are operating about 25 per cent capacity, and have enough pig iron on hand to run for close to three months without any additional purchases. That was disclosed at a meeting of the Michigan Foundrymen's Association, held at the Park-American Hotel, recently. The report on business conditions was prepared by A. W. Blodgett, secretary, and was based on 21 answers to questionnaires mailed to state plants. These answers showed that while the normal monthly melt of these 21 foundries is 9386 tons of pig, only 2337 tons were used in October and that the concerns have 6893 tons of pig in yard. October production compared with September showed an increase of 5 per cent.

The session in Kalamazoo was really the second of the organization's gatherings. Established only a few months ago, this association boasts 31 concerns enrolled to date. Six memberships were added the past month. Secretary Blodgett reports there are over 200 foundries in Michigan eligible for membership in the State association and that efforts are now being made to round them all up.

A large portion of Tuesday's meeting was devoted to the consideration of problems and troubles met by foundrymen. The question box promises to assume an important place on all programs. A discussion of trade conditions and the welfare of the association also occupied much time. Immediately following luncheon, John C. Hoekje, registrar of Western State Normal College, addressed the gathering.

The next session will be held in Battle Creek, Tuesday, Feb. 14. A. W. Blodgett, J. C. Jensen and H. J. Hartman, all of Grand Rapids, were empowered to arrange the program. Battle Creek has no members and it is believed the meeting there will induce many of that city to enroll.

Officers of the Michigan Foundrymen's Association are: President, J. Edgar Lee, Grand Haven; vice-president, W. O. Adams, Ann Arbor; secretary, A. W. Blodgett, Grand Rapids; treasurer, E. N. Turner, Manistee; directors, W. W. Sherman, Muskegon; A. K. Hanchett, Big Rapids; Henry J. Hartman, Grand Rapids; Charles Clarage, Kalamazoo; C. L. Pearce, Marquette.

Baltimore Tank Maker Expands

The Novelty Steam Boiler Works Co., Baltimore, is building another factory building, two stories, brick and steel, 110 x 155 ft., in the 900 block, South Howard Street. The concern specializes in the manufacture of steel tanks for the storage of air, water and oil. The company has 50 men working day and night and enough contracts to maintain full operation for a year or more. The company started in 1905. In August, 1920, it was reorganized, five former employees of a well-known manufacturing plant in Decatur, Ill., having secured the controlling interest. Each came from a different department and each is now head of a department in the Baltimore company to-day. Oscar S. Jennings is president, C. C. Lanman is vice-president and general manager; Raymond J. Kitchen is secretary.

Frey, Brassert & Co., Chicago, have recently shipped boiler and hot blast stove burner equipment to the Rochester & Pittsburgh Coal & Iron Co., Punxsutawney, Pa., and the Chateaugay Ore & Iron Co., Standish, N. Y. The Shenango Furnace Co. has recently installed this company's Mathesius hot blast gate valve equipment. Frey, Brassert & Co. have also been retained by the Mitchell-Diggins Iron Co., Cadillac, Mich., in reference to power plant matters.

Clinton E. Woods, receiver for the Bethlehem Motors Corporation, Allentown, Pa., manufacturer of automobile trucks, is developing plans for a sale of the property. It is said that an offer of \$400,000 has been made for the plant and equipment, with a creditors' committee asking not less than \$750,000 for the property.

Fuel Saving in Modern Gas Producers*

Avoiding Present Wastes of Fuel in the Industries Using Gas Producers, Producer-Gas Furnaces and Industrial Furnaces

BY W. B. CHAPMAN†

THERE are about 10,000 gas producers in the United States, divided approximately as follows: 6500 in the steel industries; 1500 in the glass industries; 500 in the chemical industries; and 1500 in miscellaneous industries. Under "miscellaneous" are included the ceramic industries, lime burning and about 200 gas producers used for power.

Engineers have given much attention to the engine room, some to the boiler room, a little to industrial furnaces, and least of all to the making of raw producer gas. Hence the backward condition of the gas house.

No definite data have been compiled by the Government on the amount of coal used in gas producers; but, with the assistance of such figures as are available, it is estimated roughly that in the steel industries about 15,000,000 tons of bituminous coal are transformed annually into raw producer gas for use, and in the glass industries about 2,000,000 tons.

In the steel industries about the same amount of coal is used for making gas to heat furnaces as for making steam. In glass making, three-fourths of all the fuel is used in gas producers. But wherever producer gas is used it is apt to be the most backward part of the business. A given amount of time and money, if spent on improving conditions in the gas house, will usually bring larger returns than in any other department. In most industries requiring large heating operations, more trouble arises in that department than in any other part of the business.

Savings with Mechanical Producers

With the usual more or less unskilled and indifferent handling, any of the four American mechanical producers can make a gas averaging 150 B.t.u. (low values), instead of the customary 125 B.t.u. obtained in hand-poked producers if operated with zeal. With skilled handling the best mechanical producers will average from 160 to 175 B.t.u., provided the coal is fair and the rate of gasification does not exceed 25 or 30 lb. per sq. ft. per hr., which is about twice the capacity of hand-operated producers.

A Duff producer, operating originally at 10 tons a day and making gas having 125 B.t.u., was fitted with a Chapman agitator and automatic feed, and at 36 tons a day gave an average of 163 B.t.u.

As there are more Duff producers in use in the United States than any other type of hand-poked producer, the test made by the engineers at one of the largest steel works will be of special interest. This producer was rebuilt to a diameter of 10 ft. 6 in. No hand-poking was done during the test, and no clinkers were made. A standard gas temperature of 62 deg. Fahr. was used. The West Virginia coal used had 37 per cent volatile matter. Data are given in Table I.

Similarly, a Von Kerpley producer, the most popular mechanical type in Europe, gasifying 20 lb. per sq. ft. per hr., making about 135 B.t.u. gas, was equipped with Chapman agitator and automatic feed and changed to 34 lb. gasified per sq. ft. per hr. and 178 B.t.u. This was maintained without difficulty, and without any hand poking. Data are given in Table II.

Like other European producers, the Von Kerpley producer has continuous ash removal and continuous agitation of the ash bed and lower part of the fire bed, and there is no agitation of the upper part of the fire bed and no automatic feed. Before installing the Chapman automatic feed and floating agitator, the capacity was 12 cwt. per hr., and in spite of an enormous

amount of hand poking the producer was usually full of clinkers. After the new equipment was added, the capacity was increased considerably over 50 per cent, no hand poking was required and no clinkers were made. The works engineer estimated that the saving in labor alone was sufficient to pay for the equipment in nine months. The B.t.u. content of the gas was increased about 30 per cent.

Properly operated, the best modern producers will usually save about 25 per cent of the coal and an equal amount of labor. These savings should amount to the total cost of the installation in from one to four years.

The temperature in a gas producer is highest at the bottom of the fire, and the thicker the fire, the cooler the top. The temperature at the bottom should be as high as the fuel will stand, without running too much risk of melting the ash. The melting point of the ash in all the good Pittsburgh gas coals is well above 2500 deg. Fahr.; and of the ash in Illinois coals, about 300 deg. lower. The temperature at the top of the firebed should be as low as will permit the gas to be conducted to the place of use without forming objectionable tar deposits, and also as low as possible without making the top too sticky and difficult to blow through.

Usually a "top temperature" of 1000 deg. Fahr. is about right, but, if the gas is to pass through a water-cooled reversing valve located some distance away, 1200 deg. would be better. A "hot top" destroys some of the richest gases and thus wastes fuel. More fuel is wasted in a producer, from running with a hot top, i.e., over 1300 deg., than from any other cause.

The Furnace Part of the Problem

But gasifying the fuel is only half the problem of conserving it. The other half lies in its utilization in the furnace. The two halves of the problem are inseparable. Space is too limited to take up more than one kind of furnace—the kind that holds the most promise for fuel conservation, and the kind that, until the last decade, has largely been a failure—the recuperative furnace.

A recuperative furnace is never "reversed" and, except in rare instances, only the air is preheated. It costs much less to build and to repair, is easier to operate and gives practically the same efficiency, as the expensive and cumbersome regenerative furnace.

Its field of application is very broad, and it can be used effectively in both large and small operations, for furnace temperatures as high as 2700 and as low as 1400 deg. Fahr. About the only uses to which it is not suited are for operations which periodically require a large overload, such as the open-hearth process and large forgings over 32 in. in diameter, also for large glass melting tanks. For almost all other purposes the recuperative furnace can be used with great economy.

In many operations, where the air is not now preheated, it will be found that from 20 to 40 per cent of the fuel can be saved by using a good recuperator—one that preheats the air to within 500 deg. Fahr. of the temperature of the furnace.

Table I—Test of Duff-Bradley Producer with New Blowers and Chapman Automatic Feed Floating Agitator

Analysis of Seven-Hour Continuous Sample of Gas						
Rate of gasification per 24 hr. = 37.36 tons.						
Rate of gasification per hr. per sq. ft. = 36 lb.						
Percentage Analysis of Gas Samples						
CO ₂	Cn H ₂ n	O ₂	CO	CH ₄	H ₂	N ₂
4	1.4	0.2	26.8	3.0	10.4	54.2
Calorific power of gas per min.					552,750 B.t.u.	
Sensible heat of gas per min.					94,100 B.t.u.	
Total useful heat of gas per min.					646,850 B.t.u.	

*Abstract of paper presented before the American Society of Mechanical Engineers, Dec. 6.

†President Chapman Engineering Co., New York.

Average coal fed per hr., by weight.....	3,114 lb.
Average coal fed per hr., calculated from above analysis.....	3,081 lb.
Difference.....	33 lb.

Total losses, 6.16 per cent.
Efficiency of producer, 93.84 per cent.
Producer equipped with Chapman 5-stage blower with 7/16 in. nozzle.
Coal used: Florence beans 17.62 per cent, Florence nuts 30.65 per cent, Stafford cobbles 20.73 per cent, Florence cobbles 31.00 per cent.
Average coal fed per hour, 2408 lb.
Coal gasified per sq. ft. per hr., 34.01 lb.
Total combustibles in gas produced, 42.99 per cent.
Steam used, 0.278 lb. per lb. of coal.
Gas per lb. of coal, 64.6 cu. ft.

Mining Experiment Station at Minneapolis

Work is now under way on the construction of a mine experiment station laboratory at the University of Minnesota at Minneapolis. It will house the north central experiment station of the United States Bureau of Mines. The superintendent of the station says it will be without exception the best laboratory in the world for the study of iron and manganese ores. The building, which is of factory type construction, is 60 x 280 ft. in plan, partly two stories and basement in height, partly five stories in height and the whole enclosing 1,000,000 cu. ft. The building and equipment will cost approximately \$300,000, not including \$20,000 additional for laboratory apparatus. Ground was broken Dec. 17 and the specifications call for completion on Sept. 1, 1922.

The Goodyear Tire & Rubber Co., 123 West Sixty-fourth Street, New York, with main plant at Akron, Ohio, has negotiations under way with the Brazilian Government for continuance of concessions previously granted on State property for the erection of a rubber manufacturing plant on the site. The project was planned, initially, some time ago but has been held in abeyance owing to conditions.

The Hoover Wagon Co., York, Pa., has arranged for a change of name to the Hoover Body Works, and in the future will concentrate operations on the manufacture of automobile bodies, with considerable expansion in production. A two-story factory on Webster Avenue, Long Island City, recently has been acquired, and will be equipped for a branch plant. It will provide about 18,000 ft. of floor space.

Results of Studies of Coal-Washing

Organic sulphur constitutes a larger proportion of the total sulphur in coal than is generally recognized, according to a report of the investigation of bituminous coal-washing practice in the Middle Western states by the United States Bureau of Mines, the mining department of the University of Illinois and the Illinois Geological Survey. Sulphur occurring in organic combination with the coal substance and finely disseminated pyritic sulphur can not be removed by washing. Of 110 face samples taken in four beds, two in Kentucky, one in Illinois and one in Alabama, in 53 samples the organic sulphur made up more than 50 per cent of the total sulphur.

In co-operation with the mining companies, the coal washeries at Issaquah, Grand Ridge, Ravensdale, and Wilkeson, in Washington, and at Beaver Hill, Ore., have been studied. All experimental work, except the supplementary laboratory tests, was done in the plants.

The principal results of the tests show: (1) The raw coal as it comes to the surface contains much bone, shale and clay, most of which must be removed before the coal is marketable; (2) the present washeries are inefficient, the washed coal containing avoidable impurities, and the refuse an excessive proportion of good coal. Proper adjustment of the washers not only improved the quality of the washed coal but also greatly reduced the loss of good coal in the refuse; (3) by re-arranging present flow sheets and replacing many old machines now in use with improved coal-washing equipment, the practice at each plant could be greatly improved.

Since the completion of these studies two coal companies have remodeled their plants and another company has started work on a new plant to replace its present one. Based largely on results of experiments by the Bureau of Mines, one mine is building a table-washing plant to treat a pile of refuse amounting to more than 1,000,000 tons, estimated to contain approximately 200,000 tons of recoverable coal of coking quality.

Two papers are being prepared for publication by the Bureau of Mines, one on the subject of "Specific gravity studies of Washington coals and their associated impurities," and the other on "Study of coal-washing problems in the Northwest."

Tests of the froth-flotation process, now widely used in concentrating various ores, showed that clean coal can be separated from ash in material passing a 20-mesh sieve, or finer. A great many coals, however, contain bone, or bony coal, in which the carbonaceous matter is so intimately mixed with ash that 200-mesh grinding does not separate them. As the bony coal is not as easily floated as the clean coal, re-treating the froth concentrate of coal yields clean coal, the bone forming a "middling." By the use of this method 95 to 98 per cent of the carbonaceous matter in the coal can be recovered in the concentrate and middling, and from 30 to 70 per cent of the ash discarded as tailing.

Puddling Rate Reduced to \$6

The Reading Iron Co., Reading, Pa., has reduced its rate for puddling from \$6.75 to \$6 per gross ton. Other tonnage rates are reduced in the same proportion and wages for workmen, aside from those paid on a tonnage basis, will be cut 10 per cent.

The Anderson Stove Co., recently organized at Anderson, Ind., will begin operations with the new year. It will make kitchen ranges for a Chicago mail order house. The directors of the company are John S. Keefe, Indianapolis; Jacob Keller, Belvidere, Ill., and Joseph McGinn, Louisville, Ky.

Harry W. Voss, head of the Evansville Association of Credit Men, Evansville, Ind., has been appointed receiver for the Hoosier Ice Machine Works, following a suit filed in the court by the Orr Iron Co.

Westley Fleming, receiver for the Cornish Co., Washington, N. J., manufacturer of talking machines, etc., has been granted permission by the Court of Chancery to continue the operation of the plant.

PULVERIZED COAL-BURNING

Aero Pulverizer Breaks Up Coal and Blows It Into the Furnace

At the plant of the Brier Hill Steel Co., Youngstown, Ohio, a new equipment for burning powdered fuel has been installed experimentally which has some points of interest. The installation includes an aero pulverizer furnished by the Erie City Iron Works, Erie, Pa., which has a capacity of 3000 lb. of coal per hour. This unit, which is shown in two views, is being used to provide fuel for a continuous heating furnace supplied by Alex. Laughlin & Co. for heating slabs for the 84-in. plate mill. The furnace measures 9 ft. wide and 44 ft. 6½ in. long outside, including the combustion chamber.

The pulverizer consists of a cylindrical case resting upon a bed plate and with the rotating parts driven by a 40-hp., 900 r.p.m. motor. These rotating parts consist of paddles on the entering end and fan at the delivery end, both mounted on the same longitudinal shaft. Coal is re-

Pulverizer Assembled for Delivering Coal, Through Self-Contained Blower, to Distributing System

ceived at the end opposite from the fan in pieces of regular crusher size. The paddles break it up to such effect that it is pulverized when it reaches the fan. This permits the fan to lift it and blow it into the furnace, together with the proper amount of air for combustion.

Crushed coal is delivered into a hopper above the pulverizer by a conveyor belt with a magnetic head pulley, the latter removing stray particles of iron from the coal. The pulverized coal is discharged into a pipe 18 in. in diameter, which carries it about 20 ft. and then branches into two 10-in. pipes, which enter the furnace 2 ft. 5¼ in. each side of the center line.

When this piping was first installed, it was not possible to obtain an equal distribution of the fuel because of curves in the pipe. This was easily remedied, however, by placing a deflector plate at the point where the pipe branches. As slack coal has been used, with a certain moisture content, the question of artificial drying has not been settled. As the installation has been run only a portion of the time, because of slack business, its future is not definitely determined, but reports indicate that it has given good service so far as it has been used.

Foreign Trade Council to Meet in Philadelphia

The ninth annual convention of the National Foreign Trade Council will be held in Philadelphia on May 10, 11 and 12, 1922. Previous meetings have been held in St. Louis, New Orleans, Pittsburgh, Cincinnati, Chicago, San Francisco, and Cleveland.

Referring to the impression in some quarters that the foreign trade of the United States has all but disappeared, Secretary O. K. Davis of the Foreign Trade Council says: "I wonder how many people in this country realize that our exports for the last six months

have been 63 per cent greater in value than in 1913, and about 15 per cent greater in volume; and that in the six months ending September, 1921, we have exported commodities valued at \$2,025,236,000 and have imported goods valued at \$1,197,850,000.

"The truth of the matter is, that the productive capacity of the United States has been so greatly increased during the war that our former 'normal' exports are not nearly great enough to enable our factories and farms to operate profitably at full capacity. It is certain that our foreign trade, considerable as it is even at present, must be expanded if the United States is to enjoy real domestic prosperity. The National Foreign Trade Council believes that our foreign trade can and will be so expanded, even in the face of

Cover Lifted to Show Paddles and Fan Blower, by Which Coal Is Handled

present difficulties, provided all elements of American industry, agriculture and finance will co-operate to that end."

Will Not Build Warehouse

Reports that the Jones & Laughlin Steel Co., Pittsburgh, would build a large warehouse at Evansville, Ind., to be used in distributing steel products unloaded from barges being sent down the Ohio river by the company, are untrue, as the company has no such project in mind. However, the Jones & Laughlin Steel Co. has suggested to the proper authorities in the different communities at which its steel products are unloaded from the barges sent from the Pittsburgh and Alliquippa mills, that these different communities should provide proper unloading facilities. In any event, these would not consist of more than unloading equipment and possibly a covered platform from which delivery could be made to customers in these communities by truck or wagon.

Buy a Ton of Iron!

It would be lovely this Christmas season if someone could start an effective movement with the slogan "Buy a Ton of Iron," says the current trade bulletin of the Matthew Addy Co. "That worked all right in cotton. And there were hundreds who bought a bale of cotton and made a good thing out of it. Now if the general public would take notice of the low prices prevailing for iron and of the hard conditions that the furnaces face and would start buying iron in a kindly benevolent but speculative way, it would help. The only thing the iron market needs is more liberal buying. It is the small volume of trade that worries the iron master."

John A. Ortel, safety engineer Carnegie Steel Corporation, Pittsburgh, last week talked on Educating the Workman, at the Y. M. C. U., Boston, under the auspices of the Massachusetts Safety Council.

Leroy S. Starrett, president L. S. Starrett Co., Athol, Mass., machinists' tools, has organized the Metropolitan Air Goods Co., capitalized for \$200,000, to manufacture pneumatic and waterproof goods.

Special Crane for Ordnance Plant

A 75-ton electric traveling crane having features to meet unusual conditions including a runway 165 ft. above the ground, which is believed to be the highest lift ever provided in a crane of this type, has been completed by the Cleveland Crane & Engineering Co., Wickliffe, Ohio, for the government naval ordnance plant at Charleston, W. Va. It will be installed in the heat-treating department for handling large naval guns during the heat treating operations.

An unusually high lift is required as it is necessary to handle, in a vertical position, naval guns that, with their test piece, are 87 ft. long. A gun will be brought into the plant on a railroad car, placed in a vertical position in a heat-treating furnace, and, after being heated will be lifted from the furnace and placed vertically in a tempering tank 108 ft. deep. These tanks extend into a pit 54 ft. below the floor and 48 ft. above the floor. Consequently the upper end of the gun must be raised over 135 ft. to permit the lower end to clear the top of the tank.

The crane runway being the height of a 15-story office structure required a building of unusually massive

and two 50 hp. motors for the bridge travel, there being one motor on each bridge girder. The hoist has a brake on each motor and on the second reduction shaft, making four brakes on the hoist. Because of the high lift, the hoist required 2600 ft. of 1½-in. rope.

Purchase of Ashland Iron & Mining Co. Ratified

Shareholders of the Ashland Iron & Mining Co., Ashland, Ky., at a meeting on Dec. 21, ratified the negotiations for the purchase of the property by the American Rolling Mill Co., and the assets of the Ashland company now become those of the Rolling Mill company. Besides the steel plant, consisting of two blast furnaces, six open-hearth furnaces, a modern electrically driven blooming mill, slab, billet, bar and sheet mills, the deal also includes the Ashland Coal, Iron & Railway Co., operating 48 miles of track, and the Interterminal Transit Co., which handles a large part of the industrial switching of Ashland. Some 22,000 acres of coal and timber are also included.

The purchase of the Ashland properties gives the American Rolling Mill Co. combined assets valued at

Crane for Handling Large Naval Guns in Heat-Treating Department of Naval Ordnance Plant, South Charleston, W. Va. The capacity is 75 tons, span 114 ft., and runway 165 ft. above the ground

construction to carry the load. A locomotive crane with a 250-ft. boom was used in handling steel during the erection. In addition to the high lift the predominating features of the crane include an unusually long span for its capacity, the span being 104 ft., and the high speed of the lift. The hoist speed is 50 ft. per min. and the lowering speed 100 ft. per min. both with a full load. These speeds enable quick handling of a gun from the furnace to the quenching tank. Another interesting feature is that when lowering at full speed with a full load the braking equipment that is provided, will stop the load within one foot. The crane has an automatic limit switch that stops the load 110 ft. below the crane rail. If the gun is to be lowered further, its lowering movement is continued by the operation of a push button.

The trolley travel and bridge travel are each 50 ft. per min. Rapid bridge travel is not required as the crane runway is comparatively short, being only of sufficient length to cover the furnaces and tempering tanks. The crane is operated from a pulpit, and magnetic control is provided throughout. Five motors aggregating 550 hp. are used in its operation. It has a double bridge drive. There are two 200 hp. motors on the main hoist, a 50 hp. motor for the trolley travel

\$55,000,000, according to a statement of President George M. Verity. The plans of the American Rolling Mill Co. at present are to continue operations at the same scale now in effect.

The Rolling Mill company has paid the equivalent of \$1,000,000 for \$6,000,000 net assets of the Ashland corporation. The Rolling Mill company also assumes the bonded indebtedness of the Ashland company, amounting to \$4,000,000. In the deal the Ashland stockholders received 39,875 shares of the common stock of the American Rolling Mill Co. for their properties. This stock is to be held in the corporate treasury until Oct. 1, 1923. Each shareholder of the Ashland company is entitled to one share of Rolling Mill common, par value \$25, for every 2½ shares of common stock of the Ashland company, the par value of which is \$50 per share.

The Kelley Island Lime & Transport Co., Cleveland, will absorb the Dolomite Products Co., Narlo, Ohio, the merger becoming effective Jan. 1. Howard P. Eels, president of the Dolomite Co., will become vice-president of the merged organization.

SERIOUS STRIKE TROUBLES

Governor of Kentucky Orders Troops to Maintain Order at Newport

The strike now in progress at the plants of the Andrews Steel Co. and the Newport Rolling Mill Co., at Newport, Ky., has been marked with much shooting during the past ten days. About two hundred men are at present employed in the plant, and many of the men on their way to work have been waylaid and beaten, and at times revolver shots have been fired at automobiles carrying employees. The union officials disclaim all knowledge of these shootings. On a night recently it is estimated that about 200 shots were fired in the vicinity of the mills, and many houses were hit. An injunction restraining union members and sympathizers from interfering with the employees of the company engaged in the interstate commerce has been handed down by U. S. Judge Cochran, but mill officials claim that it is only observed in the breach.

Governor Morrow, of Kentucky, has ordered four companies of the Kentucky National Guard, numbering 160 men, to Newport. This action was taken following a request of the mill officials for protection to their workmen while going to and from the mill. The civic officials of Newport and Campbell County, refused to sign a requisition for troops to maintain order, stating that they were capable of handling the situation. The Governor's action came after an investigation conducted by two State officials who had been sent to inquire into conditions prevailing at Newport.

In the Field of Labor

The New York, New Haven & Hartford Railroad has practically closed its repair shops at Readville, Mass., and at East Hartford, New Haven and Norwich, Conn., for an indefinite period. The layoff at the Readville shops involves 1000 men, at New Haven as many, at East Hartford 400, and at Norwich in the neighborhood of 100. The action of the New York, New Haven & Hartford Railroad management followed the laying off of 400 employees at the Boston & Albany Railroad's West Springfield, Mass., locomotive repair shops for two weeks beginning Dec. 22. The car repair shops at West Springfield continue in operation.

The Boston & Maine Railroad has posted notices of a substantial wage reduction applying to all classes of railroad employees over the entire system. No date has been set for the wage reduction to go into effect, but the management proposes to confer with the men beginning Jan. 15. For shopmen, including machinists, boiler-makers, blacksmiths, etc., the proposed scale will be 52c. to 67c. per hour according to classification of the workman, as contrasted with 72c. to 82c., the present range of wages. Such a wage reduction will bring the pay of machinists and such classes of workmen down to the scale existing prior to May 1, 1920.

The Quincy, Mass., branch, an assembling plant, of the Waltham Watch Co., Waltham, Mass., has resumed operations after having been closed since July last.

The Hartford Machine Screw Co., Hartford, Conn., has reduced wages 10 per cent.

The plant of the Colt's Patent Fire Arms Mfg. Co., Hartford, Conn., employing about 950, closed Saturday, Dec. 24, for inventory purposes. It will reopen Jan. 7.

The Laconia Car Co., Laconia, N. H., which has \$1,500,000 car repair work for the Boston & Maine and the Central railroads on its books, is employing 350 men, but anticipates increasing this number after the turn of the year when the plant will be operated at capacity.

F. H. Payne, president Greenfield Tap & Die Corporation, Greenfield, Mass., in behalf of the company, last week presented annual Christmas checks to members of the Old and Junior Guards, employees, who have served the company more than ten and five years, respectively.

Refractories Prices Still Weak

PITTSBURGH, Dec. 26.—Refractories prices still are slipping because of the keen competition for orders generated by the fact that there is not enough business to give all a share. On high duty Pennsylvania and Ohio fire clay brick, the common basis of sales now is \$30 per 1000, f.o.b. works, though public quotations still range \$2 to \$5 above that figure. Kentucky makers of this grade of brick are holding rather well to \$32, but it is admitted that some shading would be developed by the appearance of a sizable inquiry. Missouri makers are reported to be seeking business in nearby districts, giving basis to a suspicion that they are not holding firmly to quotations in view of the much higher freights than those from Pennsylvania and Ohio plants.

We are revising down our prices of fire clay brick in all districts save Kentucky. At least four makers of Pennsylvania silica brick are taking business at \$27, and in the Chicago district no business to speak of now is being done at above \$35. There is little firmness in magnesite or chrome brick. Demand for all grades is purely hand-to-mouth and shipping instructions usually accompany every order. Stocks in consumers' hands are reported to include only a few standard sizes, for which there is daily use, but there are some pretty big stocks of special sizes.

We quote per 1000 f.o.b. works:

Fire Clay	High Duty	Moderate Duty
Pennsylvania	\$30.00 to \$35.00	\$28.00 to \$30.00
Ohio	30.00 to 35.00	28.00 to 30.00
Kentucky	32.00 to 35.00	30.00 to 32.00
Illinois	32.00 to 35.00	30.00 to 32.00
Missouri	32.00 to 35.00	28.00 to 32.00
Silica Brick:		
Pennsylvania		28.00
Chicago		35.00
Birmingham		40.00
Magnesite Brick:		
Standard size, per net ton.....		52.00 to 55.00
Chrome Brick:		
Standard size, per net ton.....		46.00 to 48.00

Officials of Falcon Tin Plate Co.

The Falcon Tin Plate Co., which has been organized to operate the plant of the Carnahan Tin Plate & Sheet Co., Canton, Ohio, following the purchase of the latter plant by Paul Wick and Lloyd Booth of Youngstown, who control the Falcon Steel Co. in Niles, has elected Lloyd Booth president and treasurer and Paul Wick vice president and secretary. The board of directors consist of these officers and W. A. Thomas, formerly president of the Brier Hill Steel Co., C. H. Booth, formerly associated with the United Engineering & Foundry Co., Youngstown, and J. E. Carnahan, Canton, formerly principal owner of the Carnahan company. The Falcon Tin Plate Co., through a Cleveland investment house is offering \$750,000 in first mortgage 8 per cent sinking fund gold bonds.

May Buy Steel Common at \$84

In accordance with the stock subscription plan heretofore adopted by the finance committee, the employees of the United States Steel Corporation and its subsidiaries have been given the privilege of subscribing, during the month of January, for 100,000 shares of common stock at \$84 per share. In January of this year the stock was offered at \$81 per share and in 1920 at \$106.

The Butler-Edwards Electric Co., Easton, Pa., has arranged for a change in company name to the Butler Automotive Steel Co., to provide for expansion in manufacture in the line of automobile products, to include shafts, axles, gears, propellers and automotive electrical devices. Parke H. Davis has been elected president to succeed William H. McCammon. W. E. Butler is vice-president and treasurer.

The Universal Machine Co., Boston, has incorporated under Massachusetts laws to manufacture and deal in machinery for cooling and conditioning textile fabrics; paper, etc. Manufacturing will be done on the other side of the water. Ivar L. Sjostrom, North Andover, Mass., is president and treasurer.

Further Gains in Iron and Steel Exports

Larger Outward Movement of Steel Sheets and Rails—Year's Figures to Date Are Less Than Half of 1920—Imports Fall Off

WASHINGTON, Dec. 27.—Further improvement was made in iron and steel exports in November, the total for 28 items being 122,290 tons, valued at \$28,543,142. This was a gain of 15,708 tons over October, with a movement of 106,582 tons, valued at \$29,706,437. For the 11-month period ending with November of this

month period of 1920. Imports for November, 1920, amounted to 74,477 tons, valued at \$1,080,429. It will be noted that the average import value per ton was \$5.76 in November, 1921, and \$14.51 in November, 1920.

Machinery exports for November showed a decline when compared with October, the respective totals being \$14,436,849 and \$16,814,995. For the 11 months ending with November, 1921, the total exports of machinery were valued at \$275,346,019, as compared with \$593,612,060 for the same period of last year. Exports for November of last year were valued at \$41,659,329.

The gain in exports of iron and steel is reflected in the comparatively large shipments of steel sheets. The outgoing movement of this product in November totaled 36,954 tons, compared with 20,930 tons exported in October. For the 11-month period the total exports of sheets were 159,069 tons.

Imports of Iron and Steel—Gross Tons

	November		Eleven Months	
	1920	1921	Ending November	1921
Ferromanganese	7,091	270	53,830	8,818
Ferrosilicon	710	1,456	13,502	6,698
Pig iron	35,313	2,193	153,381	23,126
Scrap	5,642	2,777	136,513	39,550
Bar iron	112	80	4,682	1,676
Structural steel	225	53	1,479	657
Billets, without alloys	447	1,034	19,165	4,559
All other billets	264	51	4,252	1,261
Steel rails	309	2,406	44,061	21,154
Sheets and plates	293	38	1,697	1,942
Tin andterne plates	22	54	344	393
Wire rods	654	198	5,246	775
Total	50,992	10,610	438,242	110,609
Manganese ore and oxide	74,477	8,620	542,189	386,454

year exports aggregated 2,075,674 tons, valued at \$577,924,704. This is less than half the 4,402,056 tons, valued at \$1,170,722,938, exported during the same period of 1920.

Imports of 12 items for November showed a decline, amounting to 10,610 tons, valued at \$2,041,772, as compared with October imports of 13,565 tons, valued at \$2,888,987. For the 11-month period ending with November of the current year, imports totaled only 110,609

Exports, January, 1920, to November, 1921, Inclusive

tons, valued at \$26,787,570. This compares with imports amounting to 438,242 tons, valued at \$47,185,447, which came in during the same period of 1920.

Manganese ore imports for November were 8,620 tons, valued at \$49,681, as compared with 36,760 tons, valued at \$214,748, imported in October. For the 11 months of the present year imports of manganese ore totaled 386,454 tons, valued at \$3,289,962, as compared with 542,189 tons, valued at \$11,071,228, for the 11-

Exports of Iron and Steel—Gross Tons

Total	434,297	122,290	4,402,056	2,075,674

It is interesting to observe that of the exports of sheets during the 11-month period, approximately 64 per cent, or 97,710 tons, went to Japan. Of November sheet shipments, those to Japan represented a little more than 80 per cent of the total, 31,565 tons going to that country. Among other exports of sheets for the 11-month period and for November, respectively, were Canada, 31,516 and 2,196 tons; Argentina, 4,072 and 689 tons; and the Philippine Islands 2,742 and 504 tons.

Steel rail shipments for November totaled 15,026 tons, and for the 11-month period, 307,164 tons. Japan also was the largest single purchaser of this product for both the 11-month and the single-month periods, taking 32,589 tons for the 11 months, and 4,777 tons in November. Shipments of rails to other countries included: Canada, 20,790 and 2,502 tons; Honduras, 11,914 and 1,144 tons; Argentina 11,182 and 1,549 tons, and Philippine Islands 6,630 and 1,034 tons. Japan also was the chief market for welded pipe exports in November, taking 3,549 tons of the 11,911 ex-

ported. For the 11-month period exports of welded pipe amounted to 332,375 tons, of which Japan took 24,553 tons. Other shipments of this product in November and during the 11-month period were as follows: Argentina, 1,927, and 11,817 tons; Mexico 1,868 and 110,979 tons; Peru, 799 and 16,069 tons; Cuba, 603, and 9,295 tons; and British India, 571 and 32,588 tons.

Exports of cast iron pipe in November amounted to 2,152 tons and for the 11-month period 46,998 tons. Canada took 874 tons in November, and 4,179 tons during the 11 months; Mexico, 271 and 16,289 tons; and Cuba 231 and 7,974 tons.

Japan was also the chief exporting market in November and for the 11-month period for tin plate. Of the 8,381 tons exported in November, Japan took 5,695 tons, and of the exports of 98,557 tons for the 11 months, Japan took 24,102, or 24½ per cent.

Exports of steel plates in November amounted to 8,835 tons and during the 11 months, 327,486 tons. Canada took 698 tons in November and 100,441 tons during the 11 months, while the United Kingdom took 668 and 54,511 tons, respectively. Of the structural steel exports of 11,005 tons in November, and 287,600 tons during the 11 months, Canada took 4,911 and 55,949 tons, respectively.

The largest single item of steel imports in November related to rails, the inbound movement of this product being 2,406 tons. Scrap ranked next with 2,777 tons and pig iron third, with 2,193 tons.

Exports of metal working machinery in November amounted to \$672,810, and for the 11 months \$18,862,988. Exports of lathes for these respective periods totaled \$67,911 and \$2,857,688; of machine tools, \$270,923 and \$4,554,586.

Develops New Milling Cutter

It is announced as the result of several years of research work, covering every phase of design and operation, the National Twist Drill & Tool Co., Detroit, has placed on the market a new type of milling cutter, known as the "parabolic" cutter.

A group of the cutters is shown in the accompanying illustration. The name "parabolic" is intended to characterize the distinctive construction of the teeth.

The Shape of Tooth Is that of a Parabola, Slightly Modified at One End

It was found that in order to make a milling cutter tooth of uniform strength throughout its length, its shape would be that of a parabola slightly modified at the small end. This shape was then adopted. The number of teeth used is nearer to that of the conventional fine tooth cutter than to that of the coarse tooth type. In order to get the most efficient chip thickness per tooth without excessive peripheral speed a fairly large number of teeth was found desirable.

Plain-side and end-mill types are made, and also cutters for special purposes.

The entire sales force of the National Cast Iron Pipe Co. will convene at a banquet at the Tutwiler Hotel, Birmingham, Ala., on Jan. 5. The salesmen will be the guests of the management of the company for the entire week.

OLD RATES RESTORED

Tariffs Extending Temporary Schedule on Iron Ore Suspended

WASHINGTON, Dec. 27.—Railroad tariffs which had been filed with the Interstate Commerce Commission on statutory or 30 days' notice extending beyond Jan. 1 the operation of reduced rates on iron ore from Lake Erie ports to interior blast furnaces have been suspended by action of the commission. These tariffs were three in number, two of them having been filed by the Erie Railroad and one by the Pennsylvania Railroad and applied to rates from Cleveland, Lorain and Toledo, Ohio. They had been filed to become effective to-day, and were to remain in force until April 26.

This procedure of the commission means that all rates on iron ore from Lake Erie ports beginning with Jan. 1 will return to the old and higher level prevailing prior to Oct. 18. It was taken to establish uniformity in the rates by supplementing the recent action of the commission in declining to grant to other railroads the right to extend the lower rates to April 30 on short notice and under a sixth section application. Interior blast furnace interests, which, with the railroads, urged the granting of this application based their plea partly on the ground that unless this was done the rate situation as it applies to iron ore would be chaotic after Jan. 1 because the three suspended tariffs having been filed upon due notice would become effective to-day. The action of the commission overcomes this situation.

The reduced rates on imported iron ore, however, continue in effect and this has been the cause of complaint also. These rates cannot be suspended except by voluntary action of the railroads which have them in effect or through formal complaint.

The re-establishing of the old rates on ore from Lake Erie ports is the result of complaint by the lake front interests which maintained that by reason of the fact they did not benefit by the reduction, they were being discriminated against because they had received no benefit through lower coal, coke and limestone rates. Failure to obtain this relief, they pointed out, also upset the relationship between rates on raw materials used in the manufacture of pig iron. Interior blast furnace interests maintained that there is no relationship in rates between these commodities.

In any event the restoration of old ore rates is accepted by some of those in the iron and steel trade as an opportunity to seek a general rather than a piecemeal reduction in all commodities which they consume and manufacture. Preparations toward this end have been made and representatives of the trade will present their case before the commission at the general rate investigation, hearings on which will be resumed Jan. 9.

Jones & Laughlin Did Not Buy Chicago Tract

The 15 acres of lake shore property just east of and adjacent to the Illinois-Indiana State line purchased last April from Frederick and Ernest Eggers for \$322,500, and generally supposed to have been bought by the Jones & Laughlin Steel Co., Pittsburgh, was actually acquired by the Commonwealth Edison Co., Chicago, as disclosed by a recent announcement by Samuel Insull, president. The land includes three acres skirting Lake Michigan for 2700 ft. and will be improved with one of the largest power plants in the world to supply current to the steel mill district. No definite date has been set for the construction of the plant, however.

Rates Not Unjust

WASHINGTON, Dec. 27.—A tentative report prepared by Examiner Frank R. Mullen recommends that the Interstate Commerce Commission dismiss the complaint of the National Rolling Mill Co., vs. the Baltimore & Ohio, et al., against the rates on bar iron from Vincennes, Ind., to destinations in Indiana, Illinois, Missouri, Wisconsin, and Iowa, applied to shipments made between Dec. 5 and Aug. 25, 1920. The examiner states that the rates were neither unjust nor unreasonable.

Vertical Drill with Direct Motor Drive

A 32-in. vertical drilling machine, the chief feature of which lies in the direct application of the motor drive as shown in the illustrations, has been brought out by Prentice Conradson, Green Bay, Wis. Cone pulleys, belts, vertical shafts and other usual components have been eliminated. In this arrangement, it is claimed, tests show that no measurable loss takes place in the gearing and that smaller motors can be used, working at a higher power factor. The advantages resulting are said to include economy as to the cost of motor and in operating efficiency, as well as the saving in cost of the machine made possible by the elimination of many parts necessary in other designs.

The armature of the motor is built on a sleeve which

The Armature of the Motor Is Built on a Sleeve Supported in Ball Bearings Top and Bottom. The diagrammatic view shows the arrangement of the gearing.

is supported in ball bearings top and bottom. Mounted on this sleeve there is a pinion which engages with a gear mounted on the first intermediate shaft, as shown in the diagrammatic view. Sliding on splines on the intermediate shaft there is a cluster gear engaging with gears on the second intermediate shaft, the engagement of these gears being effected by means of a lever.

The cluster gear on the second intermediate shaft engages with gears keyed to the spindle driving sleeve, which drives the spindle through a key. The intermediate shafts and the spindle sleeve are mounted on ball bearings and oiled continuously by an oil bath. All gears on the shafts are of alloy steel, heat-treated.

There are nine speed changes, controlled by conveniently located levers. Six feeds are provided, ranging from 0.006 to 0.035. The thrust due to drilling is taken on a ball bearing. Rapid hand traverse is provided, also the usual hand feed, stop motion and depth gage. For tapping, the motor is reversed, acting as rapidly as if fitted with reversing clutches.

The motor shown in the illustration is the Watson,

built especially for the drill by the Mechanical Appliance Co., Milwaukee. The controller is also built especially for the drill, being developed by the Allen-Bradley Co., Milwaukee. The controller is designed to give snappy start and reverse and at the same time to protect the motor against accidental overloads. The controller is automatic in that the small master drum operates a clapper switch through a magnet, and at the same time the inverse time element protective device prevents abuse without stopping the motor when called on for a short overload. No voltage protection is included.

Either alternating current or direct current motors are provided, attached to the machine. A 3-hp. motor at 1200 r.p.m. is recommended for ordinary work and a 5-hp. motor at 1800 r.p.m. for very rapid work.

The frame of the machine is cast integral with the headstock, the column and base being one casting. The table has the usual adjustments, and rectangular and sliding tables can be provided. The distance from the floor to the top of the machine is 10 ft. 2 in., and to top of spindle, 11 ft. 8 in. The capacity is 3 in. high-speed drill in steel and 4 in. pipe tap in cast iron. The weight is 3700 lb. net and the floor space occupied 30x54 in.

The drill will be made also in 25-in. and 36-in. sizes.

January Meetings of Mechanical Engineers

Among meetings scheduled by branches of the American Society of Mechanical Engineers for the immediate future may be mentioned the following:

New Britain, Conn., Jan 3, address on the development and use of precision gages by Major W. E. Hoke, consulting engineer, Baltimore.

Worcester, Mass., Jan 3, at Higgins Hall, Boys Trade School address on "Mechanical Heating Problems Solved Electrically" by C. L. Ipsen, General Electric Co.

Buffalo, Jan. 4, "Patents and the Patent Law" by A. M. Halcombe, Emery, Booth, Janney & Varney, Washington.

Norfolk Va., Jan. 6, at the Chamber of Commerce, addresses on "Engineers as Industrial Managers."

New Haven, Conn., Jan. 16, "Labor and the Present Industrial Situation" by Dr. Magnus W. Alexander, managing director National Industrial Conference Board, New York.

New York, Jan. 17, at the Engineering Societies Building, 29 West Thirty-ninth Street, "A Modern Automobile Plant," by P. L. Battey, Willys Corporation.

Toledo, Ohio, Jan. 19, at the Toledo Commerce Club, "Influence of the Automobile on the Design of Presses and Dies" by Neal W. Dorman, Toledo Machine & Tool Co.

Chicago, Jan. 20, at the Hotel Sherman, addresses by Prof. Dexter S. Kimball, Cornell University, and Dr. S. W. Stratton director Bureau of Standards, Washington, following a dinner meeting.

New York, Jan. 24, Engineering Societies Building, "Industrial Power Requirements" with D. B. Rushmore, General Electric Co., presiding.

Worcester, Mass., Jan 24, in recreation room of the North Works of the American Steel & Wire Co., illustrated talk on "Manufacture and Use of Die Castings" by A. M. Brewster, president Atlas Die Casting Co., and "A Close-up of Stoker Combustion" by F. Harold Daniels, Sanford Riley Stoker Co., employing motion pictures.

Extensions at LaBelle Works

The Wheeling Steel Corporation, Wheeling, W. Va., contemplates making some large extensions to present equipment at its LaBelle Iron Works plant at Steubenville, Ohio. The company has inquiries out for a 35-in. two-high reversing blooming mill, together with tables, three heavy shears, transfers and other accessory equipment to be installed at LaBelle Works. It is expected that this contract will be placed very early in the new year, and possibly some other large equipment will be added to the LaBelle plant.

The Normal in Pig Iron

If there were such a thing as a normal need or a normal output, as of pig iron, it would be proper to refer to current production as a percentage of this normal. Then industry might take comfort in the arithmetical argument that business must soon be better, when the percentage is low, or it might note the signal, though it rarely does, that business cannot long remain active when the percentage is much over 100. However, the nearest approach to such a mode of measurement is to express operations in percentage of capacity. Coming close to 100 is naturally regarded as satisfactory, while a very low rate has only one element of satisfaction—the belief that wear and tear requirements take roundly 50 per cent of capacity and cannot long be ignored. One fault there seems to be, that buyers do ignore necessity, as they have been doing this year's or it may be that the tradition as to the minimum consumptive rate at which the country can maintain its life needs redetermination. After an upswing of business is under way again we shall be able to reappraise what is the wear and tear basis.

If attempts are ever made to consider operations in relation to so-called normal needs, it will be necessary to establish what is the normal. The term continually creeps into financial analyses of the industrial situation and gives the casual reader an incorrect conception.

The normal production of a basic material might be judged from the amounts shown over a term of years as going into consumption. In pig iron this has been an ever increasing tonnage, dependent not merely on the population but on the increasing uses demanded by what we call the advance of civilization. In the light of the records of production, we should need 780 lb. of pig iron per person for 1921, yet the year's output will be less than 45 per cent of this amount. Seeing that in 1920 production was 2 per cent above the apparent normal for that year, and that in 1919, the first full year after the swollen output of the war period, production was only 11 per cent below the apparent normal, it is perhaps hardly surprising that demand has been relatively so low this year. Disregarding surface conditions, the relatively

heavy per capita outputs of 1919 and 1920 left for 1921 a slowing up until supplies could be absorbed and until demand and production could approach a parity.

Normal needs of pig iron for 1921 may be put at 37,000,000 gross tons, so that the year's theoretical deficiency is about 20,000,000 tons, or several times what we regarded as the theoretical surplus on Jan. 1, 1921, resulting from the stimulated pig-iron making of the war period and afterward. Figures leave the conclusion that under long continued depression there is a storing up of needs against a new intensity of manufacture once the change of sentiment in business occurs, for the theoretical requirements of 1922 are 38,500,000 gross tons and there can hardly be a theoretical surplus to-day.

Thrift and Progress

The buying activities of a people fall into two categories, those represented by current consumption, the consumption of materials and the utilization of service, and those represented by the accumulation of facilities of lasting character, which will continuously furnish comfort or enjoyment. In the household, a can of tomatoes or a pound of coffee falls in the first category, an electric smoothing iron or a carpet in the second category. In governmental affairs the Congressional Record falls into the one category, a new postoffice building into the other. In industry generally, mining coal, once the mine is equipped, is similarly distinguished from the erection of a modern economical power plant.

What is commonly known as "progress" in the affairs of a people is represented by additions like these to private, semi-public or public facilities. The aim of all peoples is, or should be, to make progress. It has been well understood in the past year that progress along these lines has not been at a normal rate. Much thought has been given, and many words have been used, in an effort to indicate the impediments that have stood in the way of normal progress being made. Upon two impediments much stress has been laid, while a third impediment has received little attention.

The first of the two much-mentioned imped-

ments is high cost. Inasmuch as new facilities are installed for the purpose of rendering service in future, perhaps for many years, they represent an investment and the investor does not wish to see his investment greatly depreciate in replacement value by the cost declining in future. The principle applies similarly, though in varying degree, to an electric smoothing iron, a carpet, a power plant or an office building.

The second of the two much-mentioned impediments is the high income surtax in the federal taxation system, whereby the large investor or possible investor is not only taxed very heavily on his last dollar of taxable income but is prevented from securing an average return in a period of years because the good years are taxed heavily while in the poor years there is no refund.

These two impediments are important, but there is a third of no small importance, one that large investors no doubt have been taking into account. That is the change in the habits and ambitions of the people at large, whereby there is a disposition to spend more money than formerly on articles of current consumption and services of transient value, and less upon permanent facilities. Two impressive illustrations are the automobile and the cinema exhibition. There is current consumption of gasoline and tires and depreciation of the car itself, while the average film is old a few days after its release. It may be argued that when the people actually have the money to spend it really does not matter, but one can see that it does matter by reflecting on the large amount of the nation's productive labor that is expended in producing gasoline, tires and automobiles and in producing and exhibiting films. We are not working correspondingly harder than when we did not produce many automobiles and films, probably not nearly as hard.

The stress laid upon the two impediments to progress just mentioned would suggest that if the investor were offered a lower cost and a reduced tax, he would at once proceed to create great new facilities, but the investor might balk, on the ground that perhaps the public would not patronize his investment.

In other words, the habits of thrift of pre-war times are now not so much in evidence. Thrift is necessary if progress is to be made. For a time after the war, the absence of thrift was much commented upon and the condition was attributed to a psychological reaction from war-time conditions. It was assumed that the feeling would wear off. It is high time now to reflect that even in three years there has not been a full return to the pre-war attitude.

Business is pleased to note the activity taken by more than one agency looking to establish a demand for an international economic conference. Those on the outside think the executive department of the Government ought to take the initiative, as it did in the present political diplomatic conference. So far, the view obtains in Washington that either such a step is unwise or events have not proceeded far enough for a decision to

be reached. Put in a nutshell, world problems, after settling the question of naval disarmament, are economic and the help of men engaged in business, including finance and possibly farming, is needed. The political representatives are making the radical move of reducing naval expenditures, but it is vital, if the restoration of international credit be hastened, that the other expert be called to his responsibility and to his obligation. Selfish as well as altruistic reasons call for the economic conference and call for it as early as possible.

Hardwood Association Case

A study of the complete text of the decision of the Supreme Court of the United States in the so-called Hardwood Lumber case strengthens the opinion expressed in these columns last week that there is nothing in the decision to prevent trade associations from carrying on their work, provided they do not attempt, directly or indirectly, to influence prices. It would indeed be unfortunate if, at this time when the Government and business are co-operating more closely than ever, anything should interfere with that co-operation. One of the latest efforts in that direction has been represented by a meeting of Secretary Hoover with engineers, architects and contractors in an effort to bring about standardization of construction contracts. At this meeting it was pointed out that there are in common use over 250 different forms of contract throughout the construction industry and that no one State or section has been able to establish any one form as standard or customary. Secretary Hoover expressed the belief that standardization offers a great field not only in protection to the public but in the general improvement of ethics in the industry itself. There is not the slightest suggestion of attempting to control prices and it is difficult to see how, except in the imagination of interested attorneys, the decision in the Hardwood case can have any relation to such efforts.

The Hardwood association had a very able and energetic "manager of statistics" and it is clear that he lost no opportunity to show the members of the association the advantages of keeping down production and keeping up prices, as Justice Clarke pointed out in his decision. Constantly throughout the minutes of the various meetings of the association there is shown a discussion of the stock and production reports in which the shortage of supply was continually emphasized with the implication, not disguised, that higher prices must result. "Men in general are so easily persuaded," said Justice Clarke, "to do that which will obviously prove profitable that this reiterated opinion from the analyst of their association, with all obtainable data before him, that higher prices were justified and could easily be obtained, must inevitably have resulted, as it did result, in concert of action in demanding them." Repeatedly at the meetings, in the strongest possible terms, the danger of operating mills to such an extent as to affect prices is dwelt upon.

Letters of the manager of statistics threw a

flood of light on his activities. For example, in one stock report he tells how it can be said "to the eternal credit of the hardwood producers, that they have maintained a stout heart and stiff backbone; with the result that there has been exhibited a strength in the market which has been little short of remarkable in the face of the light demand and the vigorous efforts which have been steadily made to hammer down prices." Evidently, not merely a comparison of prices but also the comments upon the price charts and production played an important part in bringing the court to its decision, which indicates very clearly what business associations ought not to attempt to do.

A Poor Coal Year

In the fortnight ended December 10 the production of bituminous coal was at the lowest rate since last April, whereas in normal times the highest rate of production in the year would be seen. It may be worth while to reflect that circumstances have failed to justify the cry made earlier in the year that consumers should stock coal in the summer, lest they be freezing at this time. The existing condition also furnishes a commentary on the seasonal coal freight rate plan, whereby rates were to be lower in summer than in winter, to furnish the consumer a pecuniary reason for laying in stocks. The consumer has been looking for a general reduction in freight rates and is also in expectation that coal prices will be lower on account of revision in the union mining scale. Also, he was in the mood last summer to feel that if the state of his business required him to consume much coal this winter, he would be able to pay the necessary price, while if he accumulated coal that he found he could not use he would be in an unfortunate position. It is plain in the retrospect that the seasonal coal freight rate system would not have worked advantageously this year.

The present estimate is that production of bituminous coal this year will not prove in excess of 405,000,000 tons, and such an output is regarded as representing a very great recession. It is, as a matter of fact, 150,000,000 tons or 27 per cent less than the output in 1920 and 175,000,000 tons or 30 per cent less than the record output, made in 1918, in which year there was a very material accumulation of stocks.

Some industries show greater fluctuations in activity than others and it may be interesting to compare coal with steel. The steel ingot output this year will probably prove to be a trifle under 20,000,000 tons, representing about double the recession shown by coal. By another method of comparison, the 1921 steel output is equal to the output in 1905, then a record tonnage, representing a 16-year recession, while the coal output represents a recession to a point between 1909 and 1910, or a recession of between 11 and 12 years.

Such a difference is to be attributed to coal being more an article of ordinary every day con-

sumption than is steel. Both are used for the separate purposes of current operation and of improvement, but steel runs proportionately more to the latter than does coal.

The general activity of the country can be observed from various viewpoints. One is the freight ton-mileage of the railroads. That index shows the current year to be one of about 335 billion ton-miles of revenue and non-revenue movement, representing a recession of only about 25 per cent from the record, which was made in 1920, while in point of time it represents a recession only to a period between 1915 and 1916, or say five and a half years, against about 11½ years for coal and 16 years for steel.

Thus the railroad industry is a steadier one than the coal industry, and the coal industry is steadier than the steel industry. One is inclined to assume that it is on account of its sensitiveness that iron or steel is so frequently looked upon as the barometer of trade.

Wage Settlement on Industrial Prospects

Wage readjustments which take into account not only the cost of living factor but the conditions facing the specialized industry are arranged periodically by certain of the printing crafts of New York. Presumably the cost of living items could be based on the findings regularly published by the National Industrial Conference Board. It remains to ascertain what is the outlook factor. In the case cited, 200 employers are concerned. A questionnaire was sent to them to learn the promises of the future. The investigation was delegated to three accountants, one representing the employers, the second the employees, with the third serving as a neutral. Nearly 65 per cent of the questionnaires were returned, but 24 was the final number which could be used as throwing light on the question. These replies were considered sufficiently representative and therefore valid.

So far, the plan is claimed to work and it is worth reporting as a suggestion for like co-operation in the wage settlement of a local group of craftsmen. However, when the cost of living ceases to be widely fluctuating, there would then remain as the only basis of settlement the estimate of what the industry may or may not afford to do. Prophecy, difficult even for the economists, puts the scheme on a shaky footing. Dependence largely on the cost of living basis is not likely to become the vogue any more than it was before living costs were a thing of concern. If the attempt is to approach a scientific base, factors may well be included to compensate the individual worker. There is his proficiency, resourcefulness, punctuality, reliability, experience and possibly the term of his employment. Such a basis has been tried by a single employing company and no recourse was necessary to any arbitration board of accountants, which is likely to amount in operation to the conference of a judge flanked by two advocates. At best, the wage adjustment

system calling for the three arbitrator plan is not likely to remain satisfactory, no matter what is the basis of the briefs the arbitrators are to consider.

Sulphur in Ordnance Steel

New light is thrown on the subject of sulphur in steel by an abstract, elsewhere in this issue, of a paper on naval ordnance steel. There is also clearly brought out the difference between good and bad electric steel. The entire paper is a valuable contribution to the literature of the possibilities of the electric furnace when operated as it should be.

The meeting of the specifications for ordnance gun steel has for a long time been a *bête noire* of steel makers. This has been particularly true of even acid open-hearth steel as well as of some electric steel. The great difficulty has been, not so much the tensile strength or elastic limit of the ductility as measured by the elongation and reduction of area, especially on the tangential tests. The author shows that, in properly made electric steel, a lowering of the presence of sulphides and oxides contributes a product which, even in the severest tests, such as tangential, has ductile and other qualities which are superior.

On the subject of snowflakes in steel, which were a source of so much controversy and so many rejections during the war, the author states that electric steel can develop these, unless properly made. His explanation for them is: casting at too high a temperature. If this is the true solution, then genuine snowflakes are not likely to develop in carefully made acid open-hearth steel. In fact, one plant making large guns of acid open-hearth steel during the war claims to have had no trouble from such defects.

One of the future possibilities of the electric furnace is quality steel in quantity, especially with the advent of the larger units. A conclusion to be drawn from the author's paper, however, is that no matter what the process, electric or open-hearth, the product may be quantity and not quality, unless the best possible practice rules.

St. Louis Labor Conditions

ST. LOUIS, Dec. 27.—The labor situation in this district is reflected in the following table compiled by the Eighth Federal Reserve Bank from 210 leading employers in 21 of the largest cities of the district.

	Wage Earners				Per Cent	
	Men	Women	Total	Normal	Normal	Pay Roll
Nov. 1, 1921.	150,727	21,813	172,540	208,163	-17.1	\$12,572,110.67
Oct. 1, 1921.	148,492	18,753	167,245	203,219	-17.7	12,572,533.84
Nov. 1, 1920.	180,156	22,123	202,276	208,163	-2.8	16,981,748.17

From the above tabulation it will be noted that the number of employees of the reporting interests decreased 29,736 or 14.7 per cent (men 16.3 per cent and women 1.4 per cent) between Nov. 1, 1920, and Nov. 1, 1921. On Nov. 1, 1920, the number was 2.8 per cent under normal and on Nov. 1, 1921, the total was 17.1 per cent under normal. Wages, figures on a semi-monthly basis, decreased \$4,409,637.50, or 25.9 per cent, between Nov. 1, 1920, and Nov. 1, 1921.

On July 1, 1921, the total of wage earners was 27.4 per cent under normal, on Aug. 1, 1921, 23.1 per cent under normal and on Sept. 1, 1921, 16.4 per cent under normal.

CORRESPONDENCE

Making a Gage to Signal Danger

To the Editor:—The accompanying sketch shows how I connected an air gage in my office to a buzzer, so that when the air pressure goes down to 80 lb. the buzzer will attract attention. It is a common thing for the superintendent or master mechanic to have gages showing pressure of steam, air, water, oil, etc., in his office, but they do not mean anything unless there is something to tell him when pressures are down.

It can be arranged so that a buzzer or bell will give warning when any certain pressure has been reached.

A Buzzer Gives Warning When the Pressure Drops to 80 Lb.

A slot was cut in the cast-iron base opposite the 80 lb. pressure mark to take a fibre (B). A $\frac{1}{4}$ -in. piece of copper wire (A) was threaded and one end soldered to a piece of 0.005 sheet copper (D). A hole was drilled in the fibre (B) and the copper wire was pushed through the fibre and a nut run down to hold it in place. Then the fibre was fastened to the base with two small screws (C), as shown. The hand (H) was soldered slightly on the end to make a good contact with (D), which was bent to give just enough tension to make contact and to hold the hand (H) only while the pressure is between 75 and 85 lb.

The power was taken off the lighting circuit to a small General Electric transformer (E) which reduced the voltage so that the current in the secondary circuit is 12 amperes. One wire extended from the transformer (E) to the copper wire (A) and one wire from (E) to the snap switch (F); then continued from (F) to the buzzer (G) and from (G) to the air pipe, which is the ground wire.

The snap switch (F) was arranged conveniently near my desk so that when the pressure would dance around 80 lb. and ring the buzzer continually, it could be shut off until the pressure was brought up again.

This has saved a great deal of time and trouble as sometimes the men in the shop would not know what was wrong with their machines until the pressure would get so low that they could hardly operate at all.

E. J. EDWARDS,

Superintendent foundry maintenance, Erie Works,
General Electric Co.

Iron and Steel Markets

PIG IRON BUYING

Year End Activity at Expense of Prices

Steel Operations Low—Promise Lies in Construction Lines, Tin Plate and Pipe

Encouraging activity in pig iron in several centers marks the end of the year. In steel, the condition is a reduced demand accounted for by deferring of deliveries until after Jan. 1. The buying of pig iron has been at the expense of prices, but so far as that goes the year end shows an average for steel prices not merely the lowest of the year, but lower than at any time since January, 1916.

The new year is promising at the outset chiefly in continued activity in construction lines, and also in a sustained demand for pipe and tin plate. By Jan. 15 a definite betterment in mill operations is expected, which is nothing to be wondered at, seeing that now operations generally average not over 30 per cent.

Many are the comparative terms in which 1921 may be described to emphasize the position which it will take in iron and steel annals for low production. In pig iron it will be necessary to go back 17 years except for the 12 months' interval after the 1907 financial panic, but whereas in 1904 production was 15 per cent below what was then the normal and the 1908 output was perhaps 30 per cent below normal, in 1921 the deficiency will amount to 55 per cent. To secure a tonnage parallel to the year's steel input, it is necessary to go back to 1905.

Pig iron sales in the Philadelphia district in the past two weeks have amounted to 50,000 tons and some of the tonnage went as low as \$18, furnace, although most of it was sold at \$19 to \$19.50. On sales of fair volume in the Chicago market, prices receded 50c. and prices of Southern iron are down 50c., or to \$17, Birmingham. Lower prices have also been made in the Cleveland market.

The immediate effect of the Steel Corporation's reduction of \$5 a ton on wire products in the few days since it was made, on Dec. 21, has been to stop buying. Wire makers generally have met the price. Its reduction of \$3 per ton in wire rods brings the corporation price to that which has been named for some weeks by independent producers.

Tin plate makers do not expect to stock as much product as usual in the first quarter, can companies showing a disposition to anticipate needs and prices remaining firm.

The prices on pipe, reduced Dec. 15, are holding well, but so little business is there in steel boiler tubes that an extra 5 per cent is allowed by several of the smaller makers. Practically all charcoal boiler-tube plants suspended operations several weeks ago.

Little encouragement was given to the rail makers. Not only have few new orders been entered, but specifications against existing contracts are not supplied with much freedom, and a good deal of production is being stocked. The Erie has placed 7000 tons with two mills, and the Kansas City

Southern 6000 tons, and fresh inquiries have appeared or are promised covering 67,500 tons, of which 50,000 tons is for the Louisville & Nashville.

In comparison with the diminished scale of shipments on domestic orders, exporting is proportionately larger. Japan is largely responsible. On the record of the first 11 months of this year 64 per cent of the steel sheets went to Japan. That country took more rails than any other country, probably buying 50,000 tons, and was third to Mexico and India in the absorption of welded pipe. It is now actively negotiating for 16,500 tons of rails, 13,000 of these for Government railways and the remainder for an electric railroad line.

An American company will provide some \$12,000,000 worth of machinery and equipment for removing a hill in Rio de Janeiro.

With 5000 tons of fabricated steel awards and only 2500 tons in new projects, structural mills nevertheless look for a continuance of the fair buying rate of the last three months. Reinforcing bars from new steel have sold at a price corresponding to 1.45c., Pittsburgh, and some fabricators have covered plates, shapes and bars at an equivalent of 1.425c., Pittsburgh. Rivet prices of \$1 a ton below the general market have been named.

THE IRON AGE finished steel composite price is now 2.062. per lb. The pig iron figure, \$18.68, is lower than any other for the year, with the sole exception of that (\$18.51½) for Aug. 9. These two figures are the lowest since September, 1916.

Pittsburgh

PITTSBURGH, Dec. 27.

The fag end of the year shows limited activity in iron and steel as regards both buying and plant operation. There is the seasonal factor embodied in the desire of all consumers that their year end inventories shall show a big cash item and a small one in materials.

The past week has been the lightest as far as business and mill operations are concerned since July. A number of independent plants both here and in the nearby districts shut down last Saturday night and will remain down until after Jan. 2. The general expectation is that not much activity will develop until about the middle of January. Fairly steady operations are expected after that, as in the meantime the mills have had a chance of accumulate orders.

A relatively good business still is being done in steel pipe and a revival of Japanese buying of light gage sheets has somewhat enlivened that market, more especially as far as the American Sheet & Tin Plate Co. is concerned. The recent reduction of \$5 per ton in wire products, which applies to unshipped orders as well as new business, has been without effect upon the demand. In heavier products, little is going on. Activity also is lacking in semi-finished steel and the pig iron market has developed little in the way of new features since a week ago. There seems to be an outlet at well sustained prices for the better grades of open-hearth scrap. Putting out of a number of ovens in the Connellsville district has resulted in a slightly steadier market in beehive oven coke.

Pig Iron.—Interest in the market on the part of consumers of all grades has been extremely low in the past week and in the absence of important transactions, it is impossible to make any change in prices. Most of

Composite Price, Dec. 27, 1921, Finished Steel, 2.062c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets	These products constitute 88 per cent of the United States output of finished steel.	Dec. 20, 1921, 2.098c. Nov. 29, 1921, 2.135c. Dec. 28, 1920, 3.082c. 10-year pre-war average, 1.634c.
---	--	--

Composite Price, Dec. 27, 1921, Pig Iron, \$18.68 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Dec. 20, 1921, \$18.85 Nov. 29, 1921, 19.56 Dec. 28, 1920, 34.13 10-year pre-war average, 15.72
---	--

the steel makers in this district who buy their pig iron have shut down their plants for the holidays and are not much interested in the market. The foundries are taking on supplies only as needed and this means only carload lot buying of foundry iron. Sanitary ware and radiator manufacturers seem to have covered their immediate requirements, and also are only slightly interested. Producers of iron are not anticipating much contracting for the first quarter of the new year, but rather expecting that because of the effect upon prices of the expected reduction in railroad freight rates, melters will continue to buy closely to actual requirements.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$18.25
Bessemer	20.00
Gray forge	\$19.00 to 19.50
No. 2 foundry	19.50 to 20.00
No. 3 foundry	19.00 to 19.50
Malleable	20.00

Ferrosilicon.—There has been some activity in the local ferromanganese market in the last few days. The United Alloy Steel Corporation, Canton, Ohio, which has had out an inquiry for 1000 tons for next year's

delivery, has finally closed with the local producer for that quantity at the price of \$60 per ton, Pittsburgh, buyer to pay the freight to Canton. The Weirton Steel Co. has also closed for 150 tons 78 to 82 per cent material with the local producer at \$60, Pittsburgh, plus freight of \$1.82 to Weirton, making the delivered price \$61.82 per gross ton. A local open-hearth steel concern is in the market for 100 tons of 50 per cent ferrosilicon, and this may be closed before the end of the year. There is considerable demand for ferro-alloys, but it is believed that a good deal of the inquiry is to get correct ruling prices for inventory purposes. In regard to ferromanganese a local producer seems to be taking practically all of the new business offered in the Pittsburgh, Wheeling, Youngstown and other nearby districts. The delivered prices on ferromanganese of the local producer is from \$2 to \$3 per ton under the prices at which domestic and foreign material can be laid down at the various points of delivery. The fact that prompt shipments can be made by the local producer is also a factor, so that foreign and domestic, the latter made by producers away from Pittsburgh, have very little chance in this market at

the present time. Domestic and foreign makers are still quoting \$58.35, c.i.f. Atlantic seaboard, and German, which, however, runs only 76 to 80 per cent, is still offered at \$54 seaboard, and no sales are being made. The price on 50 per cent ferrosilicon seems to be a little weaker, and several small sales have been made at \$54 delivered, or slightly under that price. The market on spiegeleisen and ferrosilicon on low percentages is very dull, but prices are held fairly firm. It is stated that stocks of consumers are lower now than for many months.

We quote 78 to 82 per cent domestic ferromanganese at \$60 to \$63.67 delivered; 78 to 82 per cent foreign ferromanganese, \$58.35, c.i.f. Atlantic seaboard, German, for 76 to 80 per cent, \$54, seaboard. Average 20 per cent spiegeleisen at \$30 delivered, Pittsburgh or Valleys; 50 per cent ferrosilicon, domestic, \$54 to \$57, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$38.50; 11 per cent, \$41.80; 12 per cent, \$45.10; 13 per cent, \$49.10; 14 per cent, \$54.10; silvery iron, 6 per cent, \$27; 7 per cent, \$28; 8 per cent, \$29.50; 9 per cent, \$31.50; 10 per cent, \$33.50; 11 per cent, \$36; 12 per cent, \$38.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—There is so little going on that prices are very indefinite. The more common quotation is \$30, Pittsburgh or Youngstown, for sheet bars, slabs and 4-in. billets, but that price has found little or no basis in sales recently and since billets are offered at \$29 by some makers, that probably is as high as any business can be done. It is doubtful if a firm bid of \$29 for sheet bars or slabs would be turned down.

We quote 4 x 4 in. soft Bessemer and open-hearth billets at \$28 to \$30. 2 x 2 in. billets, \$30. Bessemer and open-hearth sheet bars, \$30; slabs, \$30; forging billets, ordinary carbons, \$32 to \$35, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—The new schedule of prices of the American Steel & Wire Co., effective Dec. 22, reducing quotations \$3 per ton, merely meets the prices which previously have been done by independent companies. All makers now are quoting a base of \$38, Pittsburgh or Youngstown for No. 5 common soft rods, but since this is no reduction to customers of independent companies there naturally has been hesitation among these consumers. The market really is rather unsteady and the appearance of sizable inquiries probably would develop recessions.

Structural Material.—Few structural awards of any considerable size are being placed with shops in this district and this makes for a dull market in plain material. So little is going on that prices are poorly defined. Quotations still range from 1.50c. to 1.60c. on structural beams, but only retail lots are bringing more than the lower figure. The McClintic-Marshall Co. has taken 250 tons for a warehouse for the H. J. Heinz Co., Pittsburgh, and 300 tons for a coal handling plant for the Ashland Coal & Coke Co., Ashland, W. Va., placed through the Pittsburgh Coal Washer Co., Pittsburgh. The Jones & Laughlin Steel Co. will fabricate 225 tons of tramway towers for the United States Smelting, Refining & Mining Co., for shipment to one of the Mexican properties of that company. Prices are given on page 1698.

Steel Rails.—The railroads are not specifying with much freedom against such orders as they have placed and a good deal of the current production of the Steel Corporation subsidiary here is being stocked. Demand for light rails is still moderate. Makers are quoting 1.60c. base, but are not adhering firmly to that figure when there is an order at stake.

We quote 25 to 45-lb. sections, rolled from new steel, 1.55c. to 1.60c. base; rolled from old rails, 1.50c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Iron and Steel Bars.—Demand is still on a tapering scale, but there seems to be a steadier tone to the market because of a realization that further concessions at this time probably would not result in orders. We regard the market as steady at 1.50c., Pittsburgh, on such tonnages as are coming from points that are not in competitive territory. With the Pittsburgh basing point largely disregarded, Pittsburgh mills would have to shade prices to get business at sources near other steel making centers, which have a lower freight rate than Pittsburgh. Reinforcing bars made from new steel have sold at 1.45c., and this price can be done again on desirable tonnages. Iron bars are slow and the

weaker tendency in other markets is not without effect upon local prices. As much as 2.25c. base is quoted on refined iron bars by Pittsburgh makers, but this is merely a negotiation quotation.

We quote steel bars rolled from billets at 1.50c.; reinforcing bars, rolled from billets, 1.45c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.40c. to 1.45c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Plates.—There has been a decided decrease in the demand, which is directly traceable to the fact that tank builders are well protected against such orders as they have on their books, while new ones have been few in the past fortnight. Pittsburgh and Youngstown plate makers are not going below 1.50c. mill, but with makers in other centers ignoring the Pittsburgh basing point, business of the former is localized.

We quote sheared plates, ¼ in. and heavier, tank quality, at 1.50c. to 1.60c. f.o.b. Pittsburgh.

Wire Products.—The announcement on Dec. 21 of the American Steel & Wire Co. reducing prices \$5 per ton, effective Dec. 22, was merely the public affirmation of prices which previously had been done by several of the independent companies, which apply also against unshipped orders. As yet the lower quotations have not been of much help to business. The new prices of the American Steel & Wire Co. are \$2.50, base per keg for bright nails, \$2.25 case 100 lb. for bright and annealed wire; \$2.75 for galvanized wire; \$2.15 for galvanized barbed wire and fence staples; \$2.65 for painted barbed wire and polished fence staples and \$2.10 for cement coated nails. One large independent is naming a price of \$2 base per count keg on cement coated nails. Other makers, although quoting \$2.10, are meeting competition.

We quote wire mills at \$2.50 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Spikes.—Local makers say that the new demand is quiet, but some railroads are in the market with inquiries, probably largely for inventory purposes rather than with the idea of placing orders. Local makers say they have made practically no sales in the past week, and do not expect to do much until after the first of the year. Prices now in effect are given on page 1698.

Iron and Steel Pipe.—Although demands are smaller in all kinds of pipe as the end of the year approaches, business is good as compared with most finished products. Jobbers seem to be enjoying a good business in merchant pipe and find it necessary to specify pretty constantly to maintain their stocks. All of the large line pipe business for this year has been closed, but it is expected that soon after the turn of the year there will be additional awards against inquiries which now are pending. Business in oil well pipe could be better. There is very good observance of the Dec. 15 steel pipe card and no change in wrought iron pipe discounts, although the wide difference between steel and iron pipe occasions some anxiety among the makers of the latter, and there are intimations of a downward revision of prices after the turn of the new year. Discounts are given on page 1698.

Cold Finished Steel Bars and Shafting.—Makers report the local situation as extremely dull in demand, and one leading maker says he does not expect very much betterment in the new demand until April of next year. Practically no orders are coming in at this time from the automobile trade, and none is expected until pretty well after the turn of the year. It is stated that stocks held by automobile buyers, and also by the machinery trade, are sufficiently large to carry them over the next month or two, without any new buying. The severe declines in prices that have taken place in shafting and cold-finished steel bars, almost prohibit any lower prices, as makers say that even at present prices, there is no profit. Recently several sales of shafting were made at 2c. at mill, but these were fairly desirable orders under the present dull situation, and less desirable orders still bring 2.10c. to 2.15c. We therefore quote cold-finished steel bars and shafting at 2c. to 2.15c. at mill, the lower price being made only on the larger orders. Ground shafting still is quoted \$2.50 base per 100-lb. f.o.b. mill, in carload lots.

Boiler Tubes.—Demand for lap welded steel boiler tubes is steady enough, but apparently there is not enough business to give all makers a share and observance of the discount card is on the part of a few rather than the many. An extra 5 per cent is being given by several of the smaller makers. Charcoal iron boiler tubes are fairly firm, but practically all makers suspended operations several weeks ago and the only company active in this district is planning on an early shut-down. Discounts are given on page 1698.

Nuts and Bolts.—Local makers state that the quiet demand which has existed for some months has been accentuated by the inventory period, and almost no new business is being placed. There is no inclination on the part of large consumers or jobbers to anticipate their needs, and the present very light demand is only for small lots to meet current needs. Makers say that present discounts are holding firm, largely for the reason that not enough business is coming up to shade them, and further, that present prices are, and have been for some time, below actual cost of manufacture. Automobile makers are buying practically nothing, but are expected to come into the market early in the new year. On the present small orders being placed, discounts in the local market are holding fairly well and these are given on page 1698.

Rivets.—New demand is seasonably quiet, buyers not caring to place any new orders until after the turn of the year. Prices show no change, but on a very desirable order it is possible that the price of \$2.25 per 100-lb. on large structural and ship rivets, and \$2.35 on large boiler rivets might be shaded. However, local makers say they have not made any sales below these prices. Considerable buying is expected in rivets shortly after the first of the year. Prices are given on page 1698.

Sheets.—Business with all makers still is of moderate proportions because of the desire of consumers and jobbers to avoid heavy stocks and not much interest in future requirements is noted, presumably because of a desire to wait until the completion of the year end check up. The one bright spot in the situation is the revival of the Japanese demand for light gage sheets. This business calls for sheets of tin mill gages and dimensions and the bulk of it is going to the American Sheet & Tin Plate Co. because it possesses the best facilities for producing this material. In spite of the generally slow demand, there is remarkably close adherence to regular market quotations. The American Sheet & Tin Plate Co., last week, operated more than 65 per cent of its hot-sheet mills. Independents averaged about 40 per cent. This week's operations will be lower because of the holiday interruptions. Prices are given on page 1698.

Tin Plate.—New business does not amount to much, but orders covering the January requirements of container manufacturers are in and generally were accompanied by specifications. The first quarter of the year usually is a period of light consumption, but it is believed that the mills will not be obliged to stock as much production as usual during the next three months because it is doubtful that there will be any further decline in prices and the can companies are showing more of a disposition to anticipate their needs than they did a year ago.

We quote standard production coke tin plate at \$4.75 per base box f.o.b. Pittsburgh for carload lots.

Hoops and Bands.—The market is dull and irregular. On hoops makers are trying to maintain a base of 2.10c., Pittsburgh, but find it necessary to go to 2c. in some districts in competition with mills having a lower freight rate to the point of consumption. On bands, no recent business has been done above 1.90c. base, although the negotiation price of most makers is 2c.

Hot-Rolled and Cold-Rolled Strips.—Real activity still is lacking, particularly with regard to early shipment tonnages. There are still some makers who are quoting 2.25c., base, for hot-rolled and 4c., base, for cold-rolled, but the more common quotations are 2c. and 3.75c., and even these prices are being shaded on desirable orders.

Coke and Coal.—Two first quarter contracts for furnace coke, one of 12,000 tons a month and the other of 10,000 tons a month, have been closed in the past week. The larger contract, made by a Valley steel maker, went to a Connellsville producing interest, and while the details as to prices have not been made public, the common impression is that it carries a price of about \$3.25 per net ton oven. The other business went to a steel works by-product plant, but the price is withheld. Negotiations still are in progress covering the requirements of the furnace of the A. M. Byers Co., Girard, Ohio, calling for 15,000 tons per month, and for 18,000 tons a month for the Trumbull-Cliffs Furnace Co., Warren, Ohio. Negotiations also are in progress for several smaller lots of furnace coke, the price to be determined by THE IRON AGE quotation on prompt or spot tonnages. The company making this proposition feels that it is a more equitable plan than that of basing the price of coke on the price of pig iron. The spot market in furnace coke is slightly firmer, as the blowing out of a number of beehive ovens has considerably shortened the supply, and while some tonnages still are available as low as \$2.75 per net ton, oven, some recent business has been done as high as \$3. The spot market in foundry coke is quotable generally at \$3.75 to \$4, though choice brands still are selling up to \$4.25. A shortage of slack grade of coal, due to the fact that there is not much demand for or production of screened coal, has resulted in some stiffening of the price, recent sales having been done at \$1.80 to \$1.90. Mine run steam coal for prompt delivery is offered at \$1.40 to \$1.50 and mine run by-product from \$1.60 to \$1.85 for spot shipment and \$1.90 to \$2 for first quarter delivery. The spot market on gas coal, mine run grade, is \$2 to \$2.30.

Old Material.—There has been some considerable activity in selected heavy steel scrap in the local market in the past week. The National Tube Co. is credited with having bought upwards of 15,000 tons of selected heavy steel scrap for its Lorain, Ohio, works, while the American Steel & Wire Co. is said to have bought 10,000 tons or more for its Donora, Pa., works. These transactions were closed about a week ago, but since that time, demand has slowed down very considerably and very little new business is being placed. Consumers do not want to buy scrap until after the first of the year, and in addition, some large consumers have suspended shipments until after Jan. 1, among these being Republic Iron & Steel Co., Youngstown, Sharon Steel Hoop Co. for Sharon and Weirton Steel Co. for Weirton, W. Va., and probably others. Local dealers say they expect by Jan. 15 or Feb. 1, there will be considerable new movement in scrap, stocks in consumers' yards being reported as very low. There is very little demand for borings and turnings, and prices are largely nominal. Consumers will not pay over \$8 to \$8.50 for turnings and not over \$8.50 to \$9 for borings, prices quoted by dealers being about 50c. per ton higher. Prices, owing to the small amount of material sold in the past week or so, have shown no important changes.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$14.50 to \$14.75
No. 1 cast, cupola size.....	16.00 to 16.50
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.50 to 16.00
Compressed sheet steel.....	12.25 to 12.50
Bundled sheets, sides and ends.....	10.25 to 10.50
Railroad knuckles and couplers.....	15.00 to 15.50
Railroad coil and leaf springs.....	15.00 to 15.50
Low phosphorus standard bloom and billet ends.....	18.00 to 19.00
Low phosphorus plates and other grades.....	17.00 to 17.50
Railroad malleable.....	13.00 to 13.50
Iron car axles.....	25.00 to 26.00
Locomotive axles, steel.....	23.00 to 24.00
Steel car axles.....	15.50 to 16.00
Cast iron wheels.....	15.00 to 15.50
Rolled steel wheels.....	15.00 to 15.50
Machine shop turnings.....	8.50 to 9.00
Sheet bar crop ends.....	14.00 to 14.50
Heavy steel axle turnings.....	11.00 to 11.50
Short shoveling turnings.....	10.00 to 10.50
Heavy breakable cast.....	14.00 to 14.50
Stove plate.....	13.00 to 13.50
Cast iron borings.....	9.00 to 9.50
No. 1 railroad wrought.....	11.50 to 12.00

Chicago

CHICAGO, Dec. 27.

Mill operations are diminishing as the end of the year draws near, but this contraction in production does not reflect reduced demand so much as the desire of buyers to have deliveries deferred until January. In fact, one of the most important local producers reports that December bookings are larger than those of November. This is largely accounted for by the heavy individual tonnages which have been ordered by car builders and tank fabricators to apply against contracts which they secured some weeks ago. While some of this tonnage will not be rolled until January, enough of it has been released this month to sustain mill operations at a higher rate than would otherwise be possible, in view of the slump in general demand. Further business from the car and tank shops is not in immediate prospect, however, as the railroads have deferred action on pending inquiries for cars and no new tank work is reported. Notwithstanding this fact, the mills are not taking a gloomy view of the situation, as they expect jobbers and others who have withheld purchases during inventory taking to re-enter the market with the opening of the new year and close for a respectable tonnage. This buying will probably be confined to the replenishment of depleted stocks, as it is likely that caution will continue to actuate the policy of consumers until a general freight rate reduction has been made.

Except for a reduction in wire and wire nails announced by the leading producer, the price situation shows little change. Plates, structural shapes and bars are no weaker than heretofore and sheet prices remain firm. Whereas the situation in finished commodities, with the exception of wire products, remains in statu quo, pig iron has shown further weakness and has dropped another half dollar.

The Illinois Steel Co. still has 11 furnaces in blast, but has reduced its steel output to 40 per cent of ingot capacity. The Inland Steel Co. has shut down its sheet mills and its continuous bar mill between the holidays, but expects to resume at a 50 per cent rate early in the new year.

Pig Iron.—With spot buying at a low ebb, attention is centered on first quarter and first half business. Some good-sized tonnages for those deliveries have been closed and the terms of the transactions indicate further weakness in the market. A northern Indiana melter bought 1000 tons of foundry at \$19 base furnace for first quarter delivery, while another Indiana consumer closed for 750 tons for first half shipment at less than that price. In fact, a local user who purchased 2000 tons of foundry for January delivery is reported to have placed the order at \$18 base, local furnace. Considerable first quarter and first half tonnage is still pending and several new inquiries are reported, including one from a local manufacturer for 300 tons of malleable for delivery during January and February to a branch plant at Indianapolis and another of 300 tons of foundry from a northern Illinois melter for first quarter shipment. Sellers look for better business in the early months of the new year, as the stocks of most melters, except the implement manufacturers, are low and operations are sufficiently active to make some replenishment buying necessary.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging sil. 1.50, delivered at Chicago.....	\$31.50
Northern coke, No. 1, sil. 2.25 to 2.75.....	\$19.50 to 20.00
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	19.00 to 19.50
Northern high phos.....	19.00 to 19.50
Southern foundry, sil. 1.75 to 2.25.....	24.17
Malleable, not over 2.25 sil.....	19.00 to 19.50
Basic.....	19.00 to 19.50
Low phos., Birmingham.....	32.00
Low phos., Valley furnace, sil. 1 to 2 per cent copper free.....	33.00
Silvery, sil. 8 per cent.....	32.82 to 34.82

Ferroalloys.—The market is inactive.

We quote 78 to 82 per cent ferromanganese, \$66.75, delivered; 50 per cent ferroallicon, \$60, delivered; spiegelisen, 18 to 22 per cent, \$86 to \$87, delivered.

Rails and Track Supplies.—Two more rail orders have been received by the Gary mill, one for 6000 tons from the Kansas City Southern and another for 4000 tons from the Erie. The railroads are evincing little interest in track fastenings for the time being. Among the few orders reported is one for 40,000 iron tie plates. The price situation shows little change, tie plates being slightly weaker as low as \$37.50 per net ton, f.o.b. mill having been done.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.70c. to 1.75c. f.o.b. makers' mills. Standard railroad spikes, 2.15c. to 2.25c., Pittsburgh; track bolts with square nuts, 2.20c. to 2.25c., Pittsburgh; tie plates, steel and iron, 1.875c. to 2c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Railroad Equipment.—The Illinois Central, Burlington, Great Northern and Union Pacific have deferred action on their inquiries for cars and locomotives until January. The Central of New Jersey has ordered 25 mikado type locomotives from the American Locomotive Co.

Bars.—Except for tonnage coming from carbuilders, little new business in mild steel bars has developed. In the reinforcing field, considerable work is in prospect, but it will not come up for bids until next year. An alternate all-reinforced concrete design of warehouse No. 12 for the Belknap Hardware & Mfg. Co., Louisville, Ky. will call for a large tonnage of bars. Even in the structural steel design now in the hands of fabricators some tonnage of reinforcing bars is specified. At Memphis, Tenn., a hospital and an auditorium and market building are proposed and both of these projects will require a round tonnage of reinforcing. Bids on the general contract for the Grant Park stadium Chicago, requiring 2700 tons of reinforcing, have been rejected. Bar iron mills report their bookings somewhat improved although the tonnage coming in is far from sufficient to put them on a satisfactory operating basis. In hard steel bars pending business includes:

Reinforcing bars for new tuberculosis sanatorium at National Soldiers' Home, Milwaukee, 500 tons. Bids being taken by H. Schmitt & Son, Inc., 430-432 Farwell Avenue, Milwaukee, successful bidder on general contract at \$1,094,000.

Mill prices are: Mild steel bars, 1.60c. to 1.75c., Chicago; common bar iron, 1.60c. to 1.65c., Chicago; rail carbon, 1.65c., mill or Chicago.

Jobbers quote 2.68c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.55c. for rounds and 4.05c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 2.38c. base. Hoops and bands, 3.28c.

Wire Products.—The American Steel & Wire Co. has announced reductions in wire and nails the new quotations being \$2.50 base per keg on wire nails, \$2.25 per 100 lb. on bright Bessemer and basic wire, and \$2.10 per count keg on cement-coated nails. The same prices have been adopted by a number of independents. New business is light both from the railroads and the jobbers. The stocks of the latter are very low, however, and they are expected to come into the market in January.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg.

Sheets.—Mills are holding firmly to the quotations named below but they are booking little new business. The mills of the local independent have been shut down for the holidays to permit the plant to be cleaned up after several months of capacity operation. Consumers' stocks, and particularly those of jobbers, are seriously depleted and better buying is therefore expected early in the new year.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stocks, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Plates.—December steel bookings of local mills have been heavier than was generally supposed, one pro-

dacer reporting them larger than those of November. Much of this tonnage has been ordered to cover the needs of carbuilders and tank fabricators who secured large contracts several weeks ago. No new lettings of oil storage tanks are reported, however, and action on pending inquiries for freight cars has been deferred until next month. The price situation is unchanged and sellers find encouragement in the fact that no further weakness has developed. Attractive business in plates, shapes and bars is moving at about 1.60c., Chicago, while exceptionally desirable tonnages are still being placed at concessions of from \$1 to \$2 a ton.

The ruling mill quotations range from 1.60c. to 1.75c. Chicago. Jobbers quote 2.78c. for plates out of stock.

Bolts and Nuts.—A number of orders have been taken recently from manufacturers of bolted tanks who are busy supplying temporary oil storage in the new Mexia (Texas) field. Little business is coming from the automobile manufacturers and the jobbers, and railroad inquiries have dropped off. Word has been received from Detroit to the effect that the leading maker of cheap automobiles stopped production on Dec. 20, and will not resume until the second week in January. The price situation is still weak and confused. For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 1698.

Jobbers quote structural rivets, 2.43c.; boiler rivets, 3.53c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 and 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Cast-Iron Pipe.—The market is exceedingly quiet with the arrival of the holiday period, but considerable business is expected to develop to the point of bid-taking early next year. One seller has a total of 50 miles of such work listed. Hammond, Ind., has awarded 40 tons of 6-in. to the National Cast Iron Pipe Co. Denver took bids Dec. 23, on 343 tons of 6, 8, 10 and 12-in. The Michigan Central Railroad received tenders Dec. 23 on one-half mile of 6-in.

We quote per net ton, f.o.b. Chicago, ex-war tax, as follows: Water pipe, 4-in., \$47.10 to \$48.10; 6-in. and above, \$43.10 to \$44.10; class A and gas pipe, \$4 extra.

Structural Material.—A holiday lull has settled over the fabricating market and there is little new business to report. Fabricators look forward hopefully to the new year and in the meantime are taking work at extremely low figures to tide their shops over the slack period. Successful bids recently named are practically on a pre-war basis, \$47.50 per ton delivered having been quoted on one job recently placed and \$64 per ton erected on another. Recent awards include:

Six hundred and seventy-five tons to the Decatur Bridge Co. for a car repair shop to be constructed at McComb, Miss., for the Illinois Central.

Milwaukee Central Continuation School, second unit, 100 tons, to C. Hennecke Co.

Wisconsin State Highway Commission, truss span at Black River Falls, Wis., 300 tons, to Worden-Allen Co.

State of Illinois, cellhouse for Lockport penitentiary, 150 tons, to Worden-Allen Co.

Contracts Pending

Structural steel for new tuberculosis sanatorium at National Soldiers' Home, Milwaukee, 100 tons. Bids being taken by H. Schmitt & Son, Inc., 430-432 Farwell Avenue, Milwaukee, successful bidder at \$1,094,000.

The mill quotation on plain material ranges from 1.60c. to 1.75c., Chicago. Jobbers quote 2.78c. for materials out of warehouse.

Warehouse Prices.—Local jobbers have reduced wire and wire nails in proportion to the mills' price reductions. The new warehouse quotations are shown under the wire products.

Old Material.—Consumptive buying is at a low ebb and prices, although weak, have changed little. The Pullman Co., which started its rolling mill last week after a long period of idleness bought about 2000 tons of No. 1 wrought and other rolling mill grades. One recent sale of 250 tons of No. 1 wrought was made at \$10.25 per net ton, delivered. Railroad offerings include the Burlington, 4000 tons; the Santa Fe, 3500

tons, and the Pennsylvania Northwestern Region, 2500 tons.

We quote delivery in consumers' yards Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton

Iron rails	\$16.00 to \$16.50
Relaying rails	\$2.00 to \$2.50
Cast iron car wheels	15.50 to 16.00
Rolled or forged steel car wheels	13.00 to 13.50
Steel rails, rerolling	12.50 to 13.00
Steel rails, less than 3 ft.	12.50 to 13.00
Heavy melting steel	11.00 to 11.50
Frogs, switches and guards cut apart	11.00 to 11.50
Shoveling steel	10.50 to 11.00
Low phos. heavy melting steel	13.50 to 14.00
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	7.50 to 8.00
Axle turnings	8.00 to 8.50

Per Net Ton

Iron angles and splice bars	14.00 to 14.50
Steel angle bars	10.50 to 11.00
Iron arch bars and transoms	15.00 to 15.50
Iron car axles	19.00 to 19.50
Steel car axles	12.50 to 13.00
No. 1 busheling	8.25 to 8.75
No. 2 busheling	6.00 to 6.50
Cut forge	10.25 to 10.75
Pipes and flues	6.50 to 7.00
No. 1 railroad wrought	10.25 to 10.75
No. 2 railroad wrought	10.00 to 10.50
Steel knuckles and couplers	11.00 to 11.50
Coil springs	12.50 to 13.00
No. 1 machinery cast	12.50 to 13.00
No. 1 railroad cast	12.00 to 12.50
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	3.50 to 4.00
Cast borings	5.50 to 6.00
Stove plate	12.00 to 12.50
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	11.25 to 11.75
Agricultural malleable	11.25 to 11.75

Birmingham

BIRMINGHAM, ALA., Dec. 27.

Pig Iron.—Sales made during week ending on Christmas Eve were on a basis of \$17. At the close of the week this was the admitted maximum. It is understood that one furnace interest had by that time made proffer of its make at around \$16.50. However, the week closed with \$17 the base as a general rule. Business of the week was a surprise to several makers. Radiator works came into the market for 1000 tons, a pipe maker took the same amount and sanitary manufacturing interests, which had already taken 1000 tons, purchased an additional tonnage. One maker booked 1500 tons and another 2500 compared with less than 1000 tons between the two the preceding week. The market is not capable of analysis and is so competitive that no price on a large tonnage would surprise. At the same time, the bookings of the past week have served to considerably stimulate the market and again there is consideration of what the eventual effect will be of the splendid position of the furnaces with regard to stocks. The Sloss-Sheffield Steel & Iron Co. blew in the Hattie Ensley furnace at Sheffield this week after months of total non-production by its furnaces, pending which the company worked off a large stock of pig iron. The Sheffield iron enjoys a differential of 40c. to 80c. over Birmingham in freight to Middle Western points of delivery. Indications point to fully as large melt by Southern foundries following the holidays as that of the fall and winter preceding. The general feeling is rather more optimistic than it has been in some time.

We quote per gross ton f.o.b. Birmingham district furnaces, as follows:

Foundry, silicon 1.75 to 2.25	\$17.00
Basic	16.00
Charcoal, warm blast	35.00

Finishing Mills.—The Tennessee Company and Gulf States Steel Co. are taking the usual holiday of a week and will resume Monday. It develops from port records that the Tennessee company shipped during the year for export about 12,000 tons of rails, plates, structural steel and track accessories monthly. This accounts for the not less than 50 per cent operation of its

finishing mills in 1921. A large portion of the exports moved down the Warrior River in barges to Mobile at a saving of 20 per cent of the all-rail freight rate.

Cast Iron Pipe.—Pipe makers report a very quiet season and will be closed until probably Jan. 15. Sale of municipal bonds in the South is going on in volume and presages a large amount of water main laying. Atlanta will soon be in the market for water mains provided out of a portion of an \$8,000,000 bond issue.

Coal and Coke.—Coke has weakened again and standard foundry is obtainable at \$5.25 to \$5.50 with furnace coke at \$5.

Old Material.—The scrap market is listless and prices tend to sag with the lower base for pig iron. So little is going on, however, that quotations have not been officially changed.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails	\$11.00 to \$12.00
No. 1 steel	10.00 to 11.00
No. 1 cast	14.00 to 15.00
Car wheels	13.00 to 14.00
Tramcar wheels	12.00 to 13.00
No. 1 wrought	12.00 to 13.00
Stove plate	11.00 to 12.00
Cast iron borings	6.00 to 7.00
Machine shop turnings	6.00 to 7.00

Boston

BOSTON, Dec. 27.

Pig Iron.—No sales of importance are reported this week, business being confined to car lots, of which possibly half a dozen or so changed hands. A textile machinery maker this week is expected to close on 250 tons No. 2 plain, and a like amount of No. 2 X, January delivery, and the Framingham Foundries, Framingham, Mass., on 350 tons, silicon 2.75 to 3.25, and 150 tons, silicon 2.25 to 2.75, first quarter delivery. A Vermont foundry is in the market for 500 tons No. 2 X iron, second quarter delivery, but few furnaces apparently are willing to sell so far ahead. Eastern Pennsylvania furnaces are quoting firmer prices and in some instances making a \$1 differential between No. 2 plain and No. 2 X, and a \$1.50 differential between No. 2 X and No. 1 X. The market for Buffalo iron also is firmer, the available tonnage obtainable for less than \$19.50 having dwindled to small proportions and at least 50c. differentials being insisted upon. Virginia and Alabama irons are still out of range with Buffalo and eastern Pennsylvania, but an occasional car lot is taken for mixture purposes.

We quote delivered at common New England points as follows, having added to furnace prices \$4.06 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East Penn., silicon 2.25 to 2.75	\$24.56 to \$25.56
East Penn., silicon 1.75 to 2.25	24.06 to 24.56
Buffalo, silicon 2.25 to 2.75	24.46 to 25.46
Buffalo, silicon 1.75 to 2.25	24.46 to 25.46
Virginia, silicon 2.25 to 2.75	30.08 to 31.08
Virginia, silicon 1.75 to 2.25	29.58 to 30.58
Alabama, silicon 2.25 to 2.75	29.16
Alabama, silicon 1.75 to 2.25	28.66

Finished Iron and Steel.—Mill representatives report little activity in iron and steel, some saying incoming business is back to the June, last, basis. The market on shapes, plates and bars is largely nominal at 1.50c., Pittsburgh. New England rolling mill interests are offered heavy bars at \$19 per gross ton alongside dock, New Jersey. Plates are selling in small lots, but the aggregate tonnage for the week is fairly large. Competition for business among the boiler makers continues keen. A Chicago concern bid \$71,800 on an Arlington, Mass., tank job, involving the destruction of one and erection of another 300-ton plate tank, while a Holyoke, Mass., firm bid \$29,737. These bids represent the two extremes. Stone & Webster, Boston, are asking bids on 800 tons of structural steel for a Western Union building at Philadelphia, and bids will be opened Jan. 12 on 400 tons for a Hudson County, N. J., hospital. A Providence, R. I., fabricator is awarded 300 tons for a local machine shop, and 214

tons for a Brookline, Mass., high school will be awarded this week.

Jobbers now quote: Soft steel bars, \$2.71½ per 100 lb. base; flats, \$3.21½; concrete bars, \$2.20 to \$2.71½; tire steel, \$4 to \$4.40; spring steel, open hearth, \$4.50; crucible, \$11.50; steel bands, \$3.31½ to \$3.78; steel hoops, \$3.11½; toe calk steel, \$5; cold rolled steel, \$3.55 to \$4.05; structural steel, \$2.71½; plates, \$2.81½ to \$2.99; No. 10 blue annealed sheets, \$3.73; No. 28 black sheets, \$4.50; No. 28 galvanized sheets, \$5.50; refined iron, \$2.71½; best refined, \$4.25; Wayne iron, \$5.50; Norway iron, \$5.50 base.

Warehouse Business.—The demand for warehouse products shows a further shrinkage, which is seasonable. Local quotations on cold-rolled steel have been reduced 20c. per 100 lb. to \$3.55 to \$4.05. Wire nails from stock are now \$3.75 per keg base, as against \$4, heretofore. Certain houses are eliminating all extras on horse shoes and offering to break packages, in an effort to reduce stocks. Picks and mattocks have been revised downward 10 per cent.

Old Material.—The old material market during the past week has been practically at a standstill. Even the American Steel & Wire Co., Worcester, Mass., has stopped buying, and purchases of machinery cast by the New England foundries is confined to minimum lots from local scrap dealers. In the absence of trading, prices have had little opportunity to change. Better conditions are anticipated after Jan. 1, when some of the eastern and central Pennsylvania steel mills are expected to enter the market for material.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery cast	\$18.00 to \$19.00
No. 2 machinery cast	16.00 to 17.00
Stove plate	14.50 to 15.00
Railroad malleable	13.50 to 14.00

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points.

No. 1 heavy melting steel	\$7.50 to \$8.00
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.00 to 7.50
Machine shop turnings	3.50 to 3.75
Cast iron borings, rolling mill	5.75 to 6.50
Cast iron borings, chemical	7.00 to 7.25
Blast furnace borings and turnings	3.50 to 3.75
Forged scrap and bundled skeleton	4.50 to 5.00
Steel car axles and shafting	11.50 to 12.00
Car wheels	11.00 to 11.50
Re-rolling rails	10.00 to 10.50

Buffalo

BUFFALO, Dec. 27.

Pig Iron.—The American Radiator Co.'s current requirements are 4000 tons for use at Buffalo plants and all furnaces with one exception are seeking the business. The one producer not interested is producing basic iron and is not in position to consider the order as one of the conditions is that shipping must be completed within three weeks. A falling off in inquiry is likely due to firmness in prices. About 10,000 tons has been sold by one furnace and some unusual tonnages are involved, the entire lot consisting of six sales. The \$20 base price ruled except on one lot of 400 tons of off-grade iron which went at \$19. The \$20 figure prevailed on sales of 2500 tons by another furnace. Some inquiry has appeared for second quarter business, but no quotations have followed. Less than 15,000 tons of new business has been booked and, of course, this is all for first quarter delivery.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.	\$20.00 to \$21.00
No. 2X foundry, 2.25 to 2.75 sil.	19.50 to 20.50
No. 2 plain, 1.75 to 2.25 sil.	19.00 to 20.00
Basic	20.00 to 21.00
Malleable	20.00 to 21.00
Lake Superior charcoal	31.75

Finished Iron and Steel.—Holiday apathy is showing an effect on sales, but every indication is at hand that business will move briskly after Jan. 1. There is a more determined stand against price concessions and plus assurances that with inventories out of the way, a number of large buyers will come into the market, the entire prospect is very bright. Bars, shapes and plates are uniformly quoted at 1.50c. and but one mill is known to have dropped below this figure on ordinary tonnages, and this interest has quoted 1.40c. on bars, Pittsburgh. The sheet market is firm and an inquiry for 250 tons of black sheets brought out the same quotation from a widely-scattered group of sellers—\$3.

Pipe, which has been in satisfactory demand, is slower and bolt and nut orders have also shown the effect of holiday lack of interest. One order for half a minimum car—12 tons, of bolts and nuts, represents the high point in recent demand for this commodity. The Buffalo Steel Co. is operating at full capacity on New York Central and Lackawanna requirements and on Dec. 28 will begin construction of 1000 steel hopper and gondola cars for the Buffalo, Rochester & Pittsburgh Railroad. The Buffalo Structural Co. is fabricating 300 tons of shapes for the Empire State Ice Co., Buffalo. The New York Central Railroad has settled with city authorities the matter of grade crossing elimination at several streets and work involving 2000 tons of shapes will be started soon.

Warehouse Business.—All lines were sluggish but salesmen generally understand a buying movement will begin soon after the holiday season. Wire nails have been reduced \$5 per ton. On the whole, there is more confidence and definite information as to the lifting of several buying embargoes is given.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.80c.; plates, 2.80c.; plates, No. 8 gage, 3.50c.; soft steel bars and shapes, 2.70c.; hoops and bands, 3.30c.; blue annealed sheets, No. 10, 3.55c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.80c.

Coke.—About 2000 tons has been sold and some evidences are at hand that a livelier market is in prospect. Prices on best grades range from \$4.25 to \$4.75 ovens.

Old Material.—Production is very light and the slightest interest in any material would likely develop in advance in prices. The same two mills have been buying heavy melting steel but tonnages at \$13.50 are scarce.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel.....	\$13.00 to \$14.00
Low phos., 0.04 and under.....	17.00 to 18.00
No. 1 railroad wrought.....	15.00 to 16.00
Car wheels.....	16.50 to 17.50
Machine shop turnings.....	7.50 to 8.00
Cast iron borings.....	7.00 to 8.00
Heavy axle turnings.....	10.50 to 11.50
Grate bars.....	12.00 to 13.00
No. 1 busheling.....	10.00 to 11.00
Stove plate.....	15.00 to 16.00
Bundled sheet stampings.....	8.00 to 9.00
No. 1 machinery cast.....	17.00 to 18.00
Hydraulic compressed.....	10.50 to 11.50
Railroad malleable.....	13.00 to 14.00

New York

NEW YORK, Dec. 27.

Pig Iron.—Inquiries for 4000 tons heretofore announced are still pending, but no new inquiries of importance have developed. The American Locomotive Co. purchased 800 tons for January delivery and the Essex Foundry 1000 to 2000 tons. An unusual fact at the close of the year is that many foundries, particularly in New England, have not bought a ton of iron the entire year and still have high priced iron on their yards or due on deliveries. Prices are about the same Buffalo merchant furnaces seem to be holding pretty closely to the \$20 base for delivery within the state, but steel companies are credited with shading the market. The company whose Southern iron was reported offered for sale at \$16.50 has made the explanation, telegraphed to this city, that the broker was not authorized to name that low figure.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$6.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	23.02 to 23.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	22.52 to 23.02
Buffalo, sil. 1.75 to 2.25	24.46 to 24.96
No. 2 Virginia, sil. 1.75 to 2.25	27.16 to 28.16

Cast-iron Pipe.—The year will close in contrast to its beginning; then operations were very slight, the most active plants operating at no greater than 25 per cent, while those same plants are now operating at 75 per cent capacity. As many new municipal administrations will be coming into office on Jan. 1, it is expected that many pipe orders will be placed. Much business is in sight for next year, particularly from New England. Judging by recent buying for delivery during the winter months, the consumers of pipe are not expecting any great drop in prices. We quote per

net ton, f.o.b. New York, carload lots, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$52.80, with \$4 additional for Class A and gas pipe.

Ferroalloys.—Sales of ferromanganese are confined to carload lots and the inquiries, amounting to about 600 tons, reported as before the market a week ago, have not yet developed into orders. A sale of a carload of British alloy at the full price of \$58.35, seaboard, is noted. Demand for spiegeleisen is also confined to small lots at prevailing quotations and the same is true of 50 per cent ferrosilicon, buying of this material being confined to the immediate needs of consumers who are operating at a much reduced capacity. There is absolutely no interest in high grade manganese ore. Quotations follow:

Ferroalloys

Ferromanganese, domestic, delivered, per ton.	\$60.00 to \$63.00
Ferromanganese, British, seaboard, per ton	\$58.35
Spiegeleisen, 20 per cent, furnace, per ton..	\$26.00
Ferrosilicon, 50 per cent, delivered, per ton,	\$55.00 to \$57.00
Ferrolungsten, per lb. of contained metal.	40c. to 50c.
Ferrocromium, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered.	11c. to 14c.
Ferrovandium, per lb. of contained vanadium	\$4.50

Ores

Manganese ore, foreign, per unit, seaboard..	20c.
Tungsten ore, per unit, in 60 per cent concentrates	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard.	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard.	\$30.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₂ , New York.	45c. to 50c.

Warehouse Business.—The market is extremely quiet and no changes of prices are reported. There is a belief that the new year will mark a certain degree of stiffening in quotations on all materials out of warehouse and slight reductions in a few products. Practically all orders placed with warehouses this week are for delivery next month. We quote prices on page 1710.

High Speed Steel.—The prevailing dullness of this market is accentuated this week by the closeness of the new year. Prices on 18 per cent tungsten high speed steel continue at from 85c. per lb. to 95c. per lb. with special brands bringing up to \$1.05 per lb.

Finished Iron and Steel.—The recent reductions by the Steel Corporation in pipe and in wire products have had the effect of stopping buying rather than anything else. Many consumers approaching the new year with little or no stocks are intimating purchases of such a scale that if half of them do as is expected, the January volume will be encouraging to the mills. As it is, the year closes with structural steel unusually active for the season and continuing business promised in tin plate and pipe. So relatively little has been the buying in December that exporting has been proportionately quite a little larger than domestic business and for this Japanese buying is largely responsible. The Atlantic Refining Co. building, noted three weeks ago as awarded, has definitely been given to the American Bridge Co. Other awards include the Neumont Realty office building, West Forty-fifth Street, 600 tons; the Gunpowder Creek bridge, 500 tons, and to the Hedden Iron Construction Co., an apartment on the southwest corner of Eighty-fifth Street and Broadway, 800 tons. Bids have been taken on 650 tons for new stringers for the Queensboro bridge and bids will be taken this week on 1300 tons for 15 bridges for the Baltimore & Ohio. The Western Union Telegraph Co. is in the market for a 1000-ton building in Philadelphia. The Great Northern is asking for bids on a 200-ft. single track bridge span. Rail orders for 1922 are as yet disappointing. It is understood that the Louisville & Nashville has bought 50,000 tons and that the Carolina, Clinchfield & Ohio is in the market for 5000 tons for the summer of 1922, the Buffalo, Rochester & Pittsburgh for a like tonnage and the Florida East Coast for 7500 tons.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.88c.; plates, 1.88c. to 1.98c.; structural shapes, 1.88c. to 1.98c.; bar iron, 1.98c. to 2.03c. On export shipments the freight rate is now 28.5c. per 100 lb., instead of 38c., the domestic rate.

Old Material.—The buying price of railroad heavy melting steel has been lowered 50c., due to a corresponding drop made by an eastern Pennsylvania steel mill.

which is now offering only \$12. The market is experiencing the usual holiday stagnation. Though one broker has raised buying prices slightly on four items, the general tendency is downward. The trade is still giving thought to the scrapping of war vessels. One proposition suggested is that the principal steel companies in eastern Pennsylvania combine in financing a company for dismantling such ships. A New York broker was offered some foreign steel vessels, but wrote back that we are not yet able to take care of our own war ships.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard.....	\$7.50 to \$8.50
Steel rails, short lengths, or equivalent.....	8.50 to 9.00
Revolving rails.....	9.50 to 10.00
Relaying rails, nominal.....	23.00 to 30.00
Steel car axles.....	10.00 to 10.50
Iron car axles.....	13.50 to 19.00
No. 1 railroad wrought.....	10.50 to 11.00
Wrought iron track.....	8.25 to 8.75
Forge fire.....	5.00 to 5.50
No. 1 yard wrought long.....	9.00 to 9.50
Cast borings (clean).....	6.50 to 7.00
Machine-shop turnings.....	4.00 to 5.00
Mixed borings and turnings.....	4.00 to 4.50
Iron and steel pipe (1 in. diam. not under 2 ft. long).....	6.75 to 7.25
Stove plate.....	9.00 to 10.00
Locomotive grate bars.....	9.00 to 10.00
Malleable cast (railroad).....	8.00 to 8.50
Cac wheels.....	10.50 to 11.50

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast.....	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size.....	15.50 to 16.00
No. 1 heavy cast, not cupola size.....	14.00 to 14.50
No. 2 cast (radiators, cast boilers, etc.).....	10.00 to 10.50

St. Louis

St. Louis, Dec. 27.

Pig Iron.—The demand for pig iron may be said to be not large enough to establish a market price. Prices are made for each piece of business, and it is a case of barter between buyer and seller. Sales ranged from a carload to 300 tons, a Texas melter buying 100 tons of foundry iron and 200 tons of malleable and 100 tons of foundry iron. Inquiries include several totaling 700 to 800 tons for first quarter shipment, 1000 tons of foundry iron for immediate shipment to a western Missouri melter, and 700 tons for a southern Illinois melter. Inquiries are out for several cars each of ferromanganese and ferrosilicon, and for a carload of spiegeleisen. The eight stove and range interests reporting to the Federal Reserve Bank show declines of from 12 to 31 per cent in November sales as contracted with the same month last year, and losses of from 2 to 16 per cent under October totals.

We quote delivered consumers' yards St. Louis, as follows, having added to furnace prices \$2.88 freight and war tax from Chicago and \$5.91 from Birmingham:

Northern foundry, sil. 1.75 to 2.25.....	\$21.88 to \$22.38
Northern malleable, sil. 1.75 to 2.25.....	21.88 to 22.38
Basic.....	21.88 to 22.38
Southern foundry, sil. 1.75 to 2.25.....	22.40 to 23.40

Finished Iron and Steel.—The usual holiday quiet prevails in the markets for finished iron and steel. Jobbers' stocks in this district are reported low, and business from this source is expected after the first of the year. The Missouri Pacific has an inquiry out for two cars of plates and the St. Louis & San Francisco Railroad wants 50 tons of structural bars and plates. Locally there is nothing being done in the building line. The contract for the Medical Arts Building, Dallas, Tex., involving 450 tons of bars has been awarded to George Hewitt, that city. Contracts will be let Jan. 3 for the Auditorium and Market House, Memphis, Tenn., involving 3000 tons of structural steel and 400 tons of bars.

For stock out of warehouse we quote: Soft steel bars, 2.77½¢. per lb.; iron bars, 2.77½¢.; structural shapes, 2.87½¢.; tank plates, 2.87½¢.; No. 10 blue annealed sheets, 3.47½¢.; No. 28 black sheets, cold rolled, one pass, 4.15¢.; cold drawn rounds, shafting and screw stock, 3.65¢.; structural rivets, \$3.52½ per 100 lb.; boiler rivets, \$3.65; tank rivets, 7/16 in. and smaller, 60-10-10 per cent off list; machine bolts, large, 60-10 per cent; small, 60-10 per cent; carriage bolts, large, 55-5 per cent; small, 55 per cent; lag screws, 65-5 per cent; hot pressed nuts, square or hexagon blank, \$1; and tapped, \$3.75 off list.

Coke.—There has been a stronger movement of coke the last week against existing contracts. Miscellaneous orders were placed for carloads to 100 tons of foundry

coke, but no tonnage of consequence was placed. Domestic coke is in heavier demand because of colder weather. The inquiry noted last week for 3000 tons of foundry coke is still open.

Old Material.—Except for a purchase of about 2000 tons of special heavy melting steel by a large consumer, the market for old material has been inactive. Rolling mill grades continue weak. Re-rolling steel rails are also off, and are now quoted at \$12 to \$12.50 per gross ton. There is very little trading between dealers, and as the mills will not accept any more material during the remainder of this year, there is nothing to do but mark time, although dealers look for a better market shortly after the turn of the year. Railroad offerings before the market this week are: Atchison, Topeka & Santa Fe, 3700 tons; Pennsylvania, Northwestern Region, 2800 tons.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton

Iron rails.....	\$15.50 to \$16.00
Steel rails, re-rolling.....	12.00 to 12.50
Steel rails, less than 3 ft.....	12.00 to 12.50
Relaying rails, standard section.....	23.00 to 28.00
Cast iron car wheels.....	15.00 to 15.50
No. 1 heavy railroad melting steel.....	11.00 to 11.50
No. 1 heavy shoveling steel.....	10.50 to 11.00
Ordinary shoveling steel.....	10.00 to 10.50
Frogs, switches and guards cut apart.....	11.00 to 11.50
Ordinary bundle sheep.....	4.50 to 5.00

Per Net Ton

Heavy axles and tire turnings.....	\$5.50 to \$6.00
Iron angle bars.....	13.50 to 14.00
Steel angle bars.....	10.00 to 10.50
Iron car axles.....	18.00 to 18.50
Steel car axles.....	13.50 to 14.00
Wrought iron arch bars and transoms.....	13.50 to 14.00
No. 1 railroad wrought.....	9.50 to 10.00
No. 2 railroad wrought.....	8.50 to 9.00
Railroad springs.....	11.50 to 12.00
Steel couplers and knuckles.....	11.50 to 12.00
Locomotive tire, 42 in. and over, smooth inside.....	8.50 to 9.00
No. 1 dealers' forge.....	7.50 to 8.00
Cast iron borings.....	6.00 to 6.50
No. 1 bushings.....	9.00 to 9.50
No. 1 boilers cut in sheets and rings.....	7.50 to 8.00
No. 1 railroad cast.....	13.50 to 14.00
Stove plate and light cast.....	12.00 to 12.50
Railroad malleable.....	9.50 to 10.00
Agricultural malleable.....	9.00 to 9.50
Pipes and flues.....	7.50 to 8.00
Heavy railroad sheet and tank.....	6.50 to 7.00
Light railroad sheet.....	4.50 to 5.00
Railroad grate bars.....	9.50 to 10.00
Machine shop turnings.....	5.00 to 5.50
Country mixed iron.....	7.00 to 7.50
Uncut railroad mixed.....	7.50 to 8.00
Horseshoes.....	10.00 to 10.50
Railroad brake shoes.....	9.50 to 10.00

Cleveland

CLEVELAND, Dec. 27.

Iron Ore.—With the restoration of the higher rail rates on ore from Lake Erie docks to interior furnaces, to become effective Jan. 1, dock shipments continue fairly heavy. These up to Dec. 22 aggregated 544,710 tons, or at the rate of about 700,000 tons for the month. The ore balance on Lake Erie docks and in furnace yards Dec. 1 was 38,300,000 as compared with 41,500,000 tons on the same date a year ago. The amount of lake ore consumed in November was 2,188,000 tons as compared with 1,833,000 tons in October.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45; Old range non-Bessemer, 51½ per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—Sales have kept up to about the recent volume in spite of the holiday period and inquiry is slightly more plentiful, particularly from the East. The market continues weak. While no lower prices are reported than have appeared during the past two weeks, lower quotations on foundry iron seem to have become more general. On this grade there is a spread of from \$19 to \$20 in quotations, depending upon the amount required and whether the inquiry comes from a competitive point having about the same freight rate from two or more furnaces. However, for No. 2 foundry iron \$19.50 seems to have become the more common quotation. One local interest sold over 5000 tons during the week and another lake furnace 2800 tons. One order for 1000 tons was placed by a Pittsburgh district consumer with a Cleveland producer at \$19.50 at a western Pennsylvania furnace. The Cleveland delivery local

furnace prices are unchanged at \$20 to \$20.50 at furnace for No. 2 foundry. Most sales are in small lots for early shipment, but some business has been taken for the first quarter delivery, including a 500-ton lot of foundry iron placed by a Springfield, Ohio, consumer. Two inquiries for malleable iron aggregating 1000 tons have come from Columbus and Indianapolis melters. There is no activity in steel-making iron. The Trumbull-Cliffs Furnace Co., Warren, expects to blow in its stack Jan. 15 and will have some surplus basic iron for the market. Stocks in many furnace yards are low and an improvement in shipment is expected in January.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$20.21 to \$20.71
Northern No. 2 fdy., sil. 1.75 to 2.25	19.00 to 20.00
Southern fdy., sil. 2.25 to 2.75	24.67 to 25.17
Ohio silvery, sil. 8 per cent.	32.86
Standard low phos., Valley furnace	34.00

Coke.—Some carlot sales of foundry coke are being made with \$4 to \$4.25 as the more common quotations for the better makes of Connellsville foundry coke.

Finished Iron and Steel.—With the holiday lull, the volume of new orders is very light. However, the leading interest reports that its December business will exceed that of November in this district. Generally prices are holding firm to 1.50c. as a minimum on steel bars, plates and shapes, although an Ohio fabricating shop is understood to have secured a lower price on part of an order for approximately 1750 tons of high-way bridge material which was divided between two mills. Small lots of boiler plates are being booked at 1.60c. and on plates lighter than 3-16 in., 1.65c. seems to be the common quotation. Sales of hoops are reported at 1.90c., or \$2 a ton lower than the recent minimum quotation. The purchase of 3000 tons of reinforcing bars for the Baldwin Reservoir of Cleveland has been deferred, as none of the steel will be needed before spring. In structural lines the Fort Pitt Bridge Works has taken the Warranty Secured Discount Co. building, Akron, requiring 1100 tons of structural steel. Lake shipyards are asking for prices on plates and shapes apparently for use in making estimates on the cost of boats with a view of interesting boat operating companies in placing orders. It is believed that the reduced cost of lake freighters will bring out orders for some boats next year. The large number of lake vessels damaged at Buffalo recently will necessitate repair work probably requiring a considerable tonnage of plates.

Jobbers quote steel bars, 2.54c.; plates and structural shapes, 2.64c.; No. 9 galvanized wire, 3.50c.; No. 9 annealed wire, 3.25c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 3.14c.; cold-rolled rounds, 3.55c.; flats, squares and hexagons, 4.35c.

Warehouse Business.—Price concessions are appearing on round lots of steel from warehouse, but prices are well maintained on small orders. The demand is light.

Wire Products.—Independent mills have followed the lead of the American Steel & Wire Co. in reducing prices to 2.50c., Pittsburgh, on nails and 2.25c. on plain wire. Orders will be taken for the first quarter at the new prices, but so far the price reduction has done little to stimulate business. The leading interest has named \$38 as its new price on wire rods.

Sheets.—Some carlot orders are being placed for January shipment, but as a whole the market is dull. Mills are maintaining regular prices, but a Valley district broker is offering black and galvanized sheets at a price concession of \$3 a ton.

Bolts, Nuts and Rivets.—New orders for bolts and nuts are very light. There is some inquiry for rivet contracts for the first quarter, but the leading local maker is declining to make contracts for that delivery until after the first of the year. Prices as low as 2.20c. for structural and 2.30c. for boiler rivets are reported, but small lot sales are being made at regular prices.

Old Material.—A West Virginia mill has placed an order with a local dealer for 500 tons of compressed steel scrap for January delivery at \$11.75 and a Cleve-

land consumer has purchased a small tonnage of heavy melting steel. Outside of these sales, the market was very quiet during the week, but considering the dullness, prices are firm. Shipments have slowed down owing to the holding up of deliveries by mills during the holiday season. In addition to temporary suspensions by other mills reported last week, the Sharon Steel Hoop Co. has held up deliveries. Cast borings and mixed borings and turnings are slightly firmer locally because of some recent Cleveland demand.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel	\$11.50 to \$12.00
Steel rails, under 3 ft.	12.50 to 13.00
Steel rails, rerolling	14.00 to 14.50
Iron rails	12.00 to 12.50
Iron car axles	18.00 to 19.00
Low phosphorus melting	13.00 to 13.50
Cast borings	8.50 to 9.00
Machine shop turnings	7.50 to 7.60
Mixed borings and short turnings	8.60 to 9.00
Compressed steel	8.75 to 9.00
Railroad wrought	12.00 to 12.50
Railroad malleable	12.50 to 13.00
Light bundled sheet stampings	6.00 to 7.00
Steel axle turnings	9.00 to 10.00
No. 1 cast	15.00 to 16.00
No. 1 busheling	8.25 to 8.75
Drop forge flashings, over 10 in.	7.50 to 8.00
Drop forge flashings, under 10 in.	7.50 to 8.00
Railroad grate bars	12.75 to 13.00
Stove plate	13.00 to 13.25
Pipes and flues	8.50 to 9.00

Philadelphia

PHILADELPHIA, Dec. 27.

Pig Iron.—In an otherwise dead market, a flurry in pig iron buying during the past week is outstanding. Competition among furnaces for sufficient business to remain in blast without piling iron brought out such low prices that some buyers decided they could do no better by waiting and a few substantial tonnages were placed, the largest of which was 3000 tons bought by a cast iron pipe company at \$18, furnace, for No. 2 plain. In this instance, however, the furnace company had a freight rate which brought the delivered price to more than \$20, and this is not far out of line with delivered prices which have been made by other furnaces closer by. Most of the week's foundry iron business has been taken at \$19 to \$19.50, furnace, for No. 2 plain and \$20 to \$20.50 for No. 2X. The bulk of the low-priced business was taken by two furnaces, one of which has only recently gone in blast. It booked 9000 tons within 10 days and then advanced its prices to a minimum of \$20 for No. 2 plain and \$20.50 for No. 2X. Other furnaces are also quoting these prices, though some quotations at or around \$19 for No. 2 plain are still outstanding. As the furnaces which have been making the lowest prices are now fairly well filled up for the present, there is a better tone in the market. In the past two weeks fully 50,000 tons of foundry iron has been sold by eastern Pennsylvania furnaces and the total of all grades for three weeks is about 75,000 tons. Some fairly good-sized inquiries are still pending, including one for 2000 tons from the Central Foundry Co. Buyers have become a bit hesitant because of the weakness in prices and on this account there has been delay in closing certain business for first quarter. An Eastern steel company last week bought 2000 tons of basic at \$20.25, making a total of 8000 tons contracted for by this company within two weeks, delivered prices being identical, though three furnaces divided the business. Makers of low phosphorus iron have reduced prices in an effort to stimulate buying, copper free iron now being quoted at \$30, furnace, and copper bearing iron at \$28, furnace. Other grades are inactive and prices are nominal. The Brooke furnace was blown in to-day.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.54 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	\$20.34 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.34 to 21.76
Virginia No. 2 plain, 1.75 to 2.25 sil.	27.74 to 28.74
Virginia No. 2X, 2.25 to 2.75 sil.	28.24 to 29.74
Basic deliv. eastern Pa.	30.25
Gray forge	21.00 to 22.00
Malleable	23.00 to 24.00
Standard low phos. (f.o.b. furnace)	30.00
Copper bearing low phos. (f.o.b. furnace)	28.00

Ferroalloys.—There is very little business and no changes in prices of ferromanganese or spiegeleisen. The former is quoted by Eastern makers at \$58.35, sea-board, which is also the British price, and spiegeleisen is quoted from \$25 to \$27; furnace.

Coke.—Foundry coke is obtainable at \$4, Connells-ville, and furnace coke from \$3.10 to \$3.25 on contract, with distress coke offered at lower prices.

Billets.—Open-hearth rerolling billets have sold at \$28 and forging billets at \$32, Pittsburgh. There is very little demand.

Finished Steel.—Consumers and jobbers have been buying very sparingly in the past week. Some steel companies' local sales offices have taken almost no business worth mentioning. Prices nominally remain unchanged, 1.50c., Pittsburgh, for plates, shapes and bars, but as has been usual for several months, concessions are made on desirable business. On a round lot of plates, shapes and bars for an Ohio fabricator an Eastern steel company quoted 1.425c., Pittsburgh, and got part of the business at this price. One order for a few hundred tons of sheets for car work stands out as exceptional in the quietness of the steel market. An inquiry for 1200 tons of shapes for the proposed new Western Union Building is in the market.

Bar Iron.—Not enough business in bar iron has been done to test the current price of 1.50c., Pittsburgh, which is quoted by most of the Eastern mills.

Warehouse Business.—There have been no changes in prices on steel out of stock in the past week. Quotations for Philadelphia delivery are as follows:

Soft steel bars and small shapes, 2.65c.; iron bars (except bands), 2.65c.; round edge iron, 2.80c.; round edge steel, iron finish, 1½ x ½ in., 2.95c.; round edge steel planished, 3.70c.; tank steel plates, ¼-in. and heavier, 2.75c.; tank steel plates, 3/16-in., 2.925c.; blue annealed steel sheets, No. 16 gage, 3.50c.; light black sheets, No. 28 gage, 4c.; galvanized sheets, No. 28 gage, 5c.; square twisted and deformed steel bars, 2.65c.; structural shapes, 2.60c.; diamond pattern plates, ¼-in., 4.60c.; 3/16-in., 4.785c.; ½-in., 4.90c.; spring steel, 4.10c.; round cold-rolled steel, 3.25c.; squares and hexagons, cold-rolled steel, 3.75c.; steel hoops, No. 13 gage and lighter, 3.50c.; steel bands, No. 12 gage to 3/16 in., inclusive, 3.25c.; iron bands, 3.90c.; rails, 2.75c.; tool steel, 8c.; Norway iron, 5c.; too steel, 4.50c.

Old Material.—Demand for scrap has fallen away almost to nothing. Prices are unchanged. The following quotations stand, in the absence of transactions, as nominally the market on the various grades for delivery at consumers' works in this district:

No. 1 heavy melting steel.....	\$11.50 to \$12.50
Scrap rail.....	11.50 to 12.50
Steel rails, rerolling.....	16.25 to 16.75
No. 1 low phos. heavy 0.01 and under.....	17.00 to 18.00
Car wheels.....	16.50 to 17.00
No. 1 railroad wrought.....	14.50 to 15.00
No. 1 yard wrought.....	12.00 to 12.50
No. 1 forge fire.....	9.50 to 10.00
Bundled sheets (for steel works).....	9.50 to 10.00
No. 1 busheling.....	12.00 to 13.00
No. 2 busheling.....	10.00 to 11.00
Turnings (short shoveling grade for blast furnace use).....	9.00 to 9.50
Mixed borings and turnings (for blast furnace use).....	9.00 to 9.50
Machine-shop turnings (for rolling mill and steel works use).....	9.00 to 9.50
Heavy axle turnings (or equivalent).....	9.50 to 10.00
Cast borings (for steel works and rolling mills).....	11.50 to 12.00
Cast borings (for chemical plants).....	13.50 to 14.00
No. 1 cast.....	16.50 to 17.00
Railroad grate bars.....	14.00 to 14.50
Stove plate (for steel plant use).....	14.00 to 14.50
Railroad malleable.....	13.50 to 14.00
Wrought iron and soft steel pipes and tubes (new specifications).....	11.50 to 12.00
Iron car axles.....	No market
Steel car axles.....	17.00 to 18.00

The Gehl Brothers Mfg. Co., West Bend, Wis., manufacturer of farm operating equipment, and conducting a foundry and machine shop business, has increased its capital stock from \$200,000 to \$350,000, of which \$250,000 is common and \$100,000 preferred stock. The new issue will be employed in the development of the business. No immediate enlargement of plant and equipment is contemplated.

Ralph A. Kellogg, secretary of the Lackawanna Bridge Co. and the Ferguson Steel & Iron Corporation, Buffalo, has called a special meeting of stockholders on Jan. 3, at the company's offices, 536 Ellicott Square, for approval of the proposed sale of both properties to the Lackawanna Steel Co., Buffalo.

Cincinnati

CINCINNATI, Dec. 27.

Pig Iron.—As was expected, the holiday week in the market was a quiet one. There were, however, occasional carload sales made, and in one case 500 tons of Southern iron was bought by an Ohio melter. This was the only sale of consequence in the Cincinnati district. Radiator interests are reported to have booked considerable tonnages of iron for first quarter delivery, the iron coming from Buffalo, Valley and Birmingham districts, and it is reported that the price on the Northern iron was \$19, furnace, while that on Southern was \$17. There is very little inquiry. An Indianapolis melter is in the market for 300 tons of malleable, a northern Ohio melter for 300 tons of foundry, and an Indiana melter for 100 tons of low phosphorus. A Cleveland district melter is inquiring for 1000 tons of Bessemer iron. An Illinois car wheel manufacturer is inquiring for 250 tons of high silicon iron and 200 tons of ferromanganese for shipment to its Michigan plant. There have been no price changes reported, Southern iron being quoted at \$17, Birmingham and Northern at \$19.50 to \$20. The trade is rather expectant of some business developing during the month of January, and is very much encouraged over the prospects. Sarah Furnace of the Kelly Nail & Iron Co. in southern Ohio will blow in Jan. '1, while Jisco Furnace in Jackson County will go out during the present week. It is expected that the Portsmouth stack will be lighted soon after New Year's.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base)	\$21.50
Southern coke, sil. 2.25 to 2.75 (No. 2 soft)	22.00
Ohio silvery, 8 per cent sil.	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2)	\$22.02 to 22.52
Basic, Northern	22.02
Malleable	22.52

Finished Material.—The market is passing through the customary quietness of the holiday period, and very few orders are being placed. Orders for wire products for delivery during the first quarter have been booked on the basis of the new prices quoted by the American Steel & Wire Co., effective Dec. 21. This new schedule makes the price of common wire nails \$2.50 per keg base, Pittsburgh, and plain wire \$2.25 per 100 lb., Pittsburgh. Corresponding reductions have been made on other wire products. An independent company reports receipt of an order for 300 tons of structural steel from a central Ohio fabricator. This business was placed on the basis of 1.50c., Pittsburgh. A number of inquiries for reinforcing bars are also before the trade. Prices on the heavier steel products show very little change, the usual quotations on bars, shapes and plates being 1.50c., Pittsburgh. In sheets there is very little inquiry and the prices are holding firmly at 3c. for black and 4c. for galvanized. Some activity is apparent in the structural field. The largest project up for bids is a warehouse for the Belknap Hardware Co. at Louisville, Ky. This will take 2200 tons of reinforcing bars and 3000 tons of structural steel. Bids will close on Dec. 29. Bids are also in for a Shriner's Temple at Charleston, W. Va., taking 600 tons. The Elks Temple, Cincinnati, taking 300 tons, will likely be awarded this week. An hotel in Johnston City, Tenn., taking 550 tons, will be up again shortly, as some revision has been made in the plans. Pending projects include an office building at Memphis, Tenn., 600 tons, and the Catholic Club at Memphis, Tenn., 900 tons. These are expected to come up shortly after the first of the year. Lettings include 300 tons to the Belfontaine Bridge Co. for an erecting shop for the Illinois Car Co. at Urbana, Ohio, and a hotel at Frankfort, Ky., 250 tons, to a Louisville fabricator.

Coke.—There is very little activity in the coke market. A southern Ohio furnace has closed on 2500 tons of furnace coke per month, for three months, at a reported price of \$4.50, West Virginia ovens. A central Ohio melter also purchased 300 tons of foundry coke for February shipment. With these exceptions, sales are confined to carloads. There is practically no inquiry.

Warehouse Business.—Warehouse business is very quiet, due no doubt, to the holiday period. In view of the depleted condition of stocks, however, it is expected that much improvement will be shown after the first of the year. Prices are unchanged.

Iron and steel bars, 2.90c. base; hoops and bands, 3.50c. base; shapes and plates, 3c. base; reinforcing bars, 2.97½c. base; cold rolled rounds, 1½-in. and larger, 3.70c.; under 1½-in. and flats, squares and hexagons, 4.30c.; No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$3.25 per keg base; No. 9 annealed wire, \$3 per 100 lb.

Old Material.—Dealers report business as still stagnant. It is reported that a Valley consumer bought in the neighborhood of 2000 tons of heavy melting steel, at an unnamed price. Locally the market is very quiet, but prospects for the future are brighter, in the opinion of local dealers. Prices are unchanged.

We quote dealers' buying prices, f.o.b. cars:

Per Gross Ton			
Bundled sheets		\$3.50 to	\$4.00
Iron rails		12.00 to	12.50
Relaying rails, 50 lb. and up		25.00 to	26.00
Re-rolling steel rails		10.50 to	11.00
Heavy melting steel		9.00 to	9.50
Steel rails for melting		9.00 to	9.50
Car wheels		12.00 to	13.00
Per Net Ton			
No. 1 railroad wrought		8.50 to	9.50
Cast borings		3.00 to	3.50
Steel turnings		2.00 to	2.50
Railroad cast		12.00 to	12.50
No. 1 machinery		13.50 to	14.50
Burnt scrap		7.50 to	8.00
Iron axes		15.50 to	16.50
Locomotive tires (smooth inside)		9.50 to	10.00
Pipes and flues		4.00 to	4.50

Belgium Feeling British Competition

BRUSSELS, BELGIUM, Dec. 8.—The dullness in the Belgian iron and steel market continues, although there is some exporting to neighboring markets. Belgian bars are being consumed in fair quantities by the United Kingdom manufacturers of screws and bolts, and there is a more pronounced demand from English shipyards for iron of the quality used in making chains. Of late there has been a slight diminishing in the exports of Belgian and French irons to England, Cleveland makers having reduced quotations by about 10s.

With the approach of Christmas a heavy influx of cutlery and other metal utensils from Sheffield, England, has been noted to the detriment of the domestic product. Spanish speaking markets and the British colonies have inquired for, and purchased, sheet copper products, valves, filters, water meters, pressure and steam gages, small metal specialties of German and Austrian manufacture have almost completely displaced the British products in Belgium and in England. The British Board of Trade is considering protests of English manufacturers, who claim that this influx of Continental products constitutes dumping.

The strong effort of British rolling mills for export business is beginning to be felt by the Belgian export trade, which considered that it had gained a permanent and fairly secure foothold in many foreign markets. Much capital seems to be made by British sellers of the unsettled and disorganized conditions of Continental sellers and the consequent uncertainty of deliveries in view of strikes and other obstacles. The situation among Belgian rolling mills is not of the best, but one of the principal reasons has probably been the extremely independent attitude of many mills toward rolling any but specification material, which they consider sufficiently remunerative. The recent increase of 2s. to 5s. per ton on semi-finished material has resulted in the almost complete stoppage of English orders.

Among recent export contracts of size is about 5000 tons of rails sold to Japan at about \$45 per ton, c.i.f. port. Belgian foundry iron has been offered at \$25 per ton on the Pacific Coast of the United States.

It is announced from Wabash, Ind., that the Service Motor Truck Co. of that city has completed negotiations with the Polish Government for 1300 trucks, parts and tires, representing a value of \$8,500,000, the first shipment of which has gone forward.

British Iron and Steel Market

Holiday Season Has Curtailed Business—Galvanized Sheets Weak—Railroad Rate Reductions Less Than Expected

(By Cable)

LONDON, ENGLAND, Dec. 24.

As there is a holiday until Wednesday (Dec. 28) most works are closing until after the new year begins. Railroad rates for raw materials and certain classes of manufactured iron and steel have been reduced 25 per cent. Traders, however, are not over hopeful, as a greater reduction had been anticipated.

There is more inquiry for Cleveland pig iron, but little business. Steel rails have been reduced 20s. (\$4.20) for home buyers. There is more business moving, but not enough to keep the works employed.

German merchant bars have been sold to India at £8 7½s. (1.57c. per lb.) c.i.f. China bought merchant bars at £9 15s. (1.83c. per lb.) c.i.f., but is now offering £9 5s. to £9 7½s. (1.73 to 1.76c. per lb.) c.i.f.

German structural steel (beams) is being sold at £7 10s. (1.41c. per lb.) f.o.b., for January shipment. Belgian angles are quoted at £7 10s. to £7 15s. (1.41 to 1.45c. per lb.) f.o.b., for first half of January. German wire rods are being sold at £8 10s. (\$35.70) f.o.b. for first quarter shipment.

Tin plates are weaker on the continuance of forced liquidation. Prompt 28 x 20's have sold at 40s. (\$8.40) f.o.b. for December delivery. For far forward shipment, sales are done at less. Export demand has decreased. Home trade is buying odd sizes at 20s. (\$4.20) basis for January delivery.

India has bought fair lines of 24-gage galvanized sheets at £16 12½s. and £16 10s. (3.12c. and 3.09c. per lb.) f.o.b. for January delivery. The market is weak.

We quote gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$4.20 per £1 as follows:

Durham coke, delivered	£1 8½	to £1 10	\$5 38 to \$6.30
Cleveland No. 1 foundry	5 5	& 5 10*	22.05 & 23.10*
Cleveland No. 3 foundry	5 0	& 5 5*	21.00 & 22.05*
Cleveland No. 4 foundry	4 15		19.95
Cleveland No. 4 forgo	4 10		18.90
Hematite	7 0*		29.40*
East Coast mixed	5 0	& 5 2½*	21.00 & 21.52*
Ferromanganese	15 0	& 14 10*	63.00 & 60.90*
Rails, 60 lb. and up	8 10	to 9 10	35.70 to 39.90
Billets	8 0	to 8 5	33.60 to 34.65
Sheet and tin plate bars			
Welsh	7 15		32.55
Tin plate, base box	0 13¼	to 1 0½	4.15 to 4.36
			C. per lb.
Ship plates	9 10	to 10 10	1.78 to 1.97
Boiler plates	14 0	to 14 10	2.62 to 2.72
Tees	10 0	to 11 0	1.87 to 2.06
Channels	9 5	to 10 15	1.73 to 2.02
Beams	8 0	to 10 0	1.50 to 1.81
Round bars, ½ to 3 in.	10 5	to 10 10	1.92 to 1.97
Galvanized sheets, 24 g.	16 10	to 17 0	3.09 to 3.19
Black sheets	14 0		2.62
Steel hoops	12 0	& 12 5*	2.25 & 2.30*
Cold rolled steel strip, 20 g.	24 10		4.59

*Export price.

Continental Competition in Pig Iron and Steel Rapidly Diminishing—Sentiment Better

LONDON, ENGLAND, Dec. 14.—The improvement in trade conditions, which has been eagerly looked for so long, has only made its appearance in a few branches of the iron and steel industry, such as the galvanized sheet and tin plate trades, though generally speaking all improvement is very gradual. However, sentiment is considerably better, based on settlement of the Irish question, the favorable progress which is being made at the Washington conference and the talk of some new conditions being arrived at in respect of payment of reparations by Germany. These factors, together with the fact that labor has more or less settled down, gives a generally more hopeful feeling. At the time of writing no strikes are threatened, though wages are being cut.

Business in pig iron does not expand. Makers keep cutting prices but buyers are shy at placing or-

ders for anything like substantial quantities while the uncertainty of values lasts and while there are reasonable hopes of railroad rates being considerably reduced. No. 3 Cleveland iron at 100s. per ton, delivered consumers' works, easily competes with Continental pig iron, and supplies of that material coming to this country are diminishing, especially as Continental prices have been raised, owing to shortage of fuel there. During the week two Cleveland furnaces, which were producing basic pig iron, have been transferred to foundry iron, making five furnaces producing the latter. The hematite market is weak. There is some scattered demand, but it is insufficient to absorb production, especially as four more furnaces have recently been started. Rather than put this iron into stock, makers are cutting prices. East Coast mixed numbers are now worth not more than about 102s. 6d.

Foreign ore is to all intents and purposes a dead market. Here and there one hears of small cargoes changing hands, but the Spanish mine owners are not at all inclined to reduce their selling prices. Best Bilbao rubio is nominally about 26s. to 27s., ex-ship Tees.

In finished and semi-finished iron and steel, Continental competition is out of the running for semi-finished material, but in finished steel competition from that source is still an important factor. Makers here, however, are, as far as they are able, taking steps to secure orders and very low figures are heard of in connection with special sales for export. How long they hope to be able to do so is uncertain, as selling at these figures entails considerable loss, and while some makers are adopting this policy, others would sooner curtail or cease production. Of course, if railroad rates came down, as indeed it is hoped they will, steel makers would have a chance to secure orders, but the general demand at the present time is totally inadequate.

Swan, Hunter & Wigham Richardson, Ltd., has secured contracts for two small vessels for use on Canadian lakes. The order is not an important one in respect of size, but it is distinctly encouraging.

Experimental Work of the Bureau of Mines

At the experiment station of the Bureau of Mines at Seattle, Wash., further studies of the carburization of iron have been made in connection with the production of synthetic gray iron from scrap steel or from sponge iron. This study includes the introduction of carbon in presence of varying amounts of silicon, manganese, sulphur, etc. New and interesting results bearing upon the carburization of iron are being obtained.

In a general study of drill steel problems, being conducted at the Mississippi Valley station of the bureau, a report on the results of rock drill tests in the Missouri-Kansas-Oklahoma zinc district has been completed. Another phase of the drill steel problem, to determine the best composition of a straight carbon steel for drilling in granite, has been assigned to two "fellows" in the Missouri School of Mines, with Prof. C. R. Forbes and C. Y. Clayton acting in an advisory capacity. Plans and specifications are being drawn for constructing an oil-fired furnace to heat drill steels.

Work formerly done at the Berkeley, Cal., station of the bureau on the reduction of iron oxides with various reducing gases (producer gas, oil gas, etc.), showed that methane probably does not function actively in the reduction of iron oxides at temperatures up to 1470 deg. Fahr. To check up this point and to find out at just what temperature it does begin to function actively, work is being done on the preparation of pure methane and its application to various oxides of iron.

In connection with the general study of Neumann bands in steel, being conducted at the station of the bureau at Minneapolis, Minn., a special study has been made of the results obtained in subjecting mild steel disks to sudden distortion by means of explosions of various velocities.

In the course of the experiments regarding the reduction of iron oxide, 75 experiments were recently performed at the Minneapolis station of the bureau on

the resistance encountered by a stream of air in passing through a bed of ore and of coke. Fifty additional experiments on the transfer of heat from a gas to a solid were carried out, for the case of air passing through a bed of lead shot. These experiments on the resistance of gases, and the transfer of heat, constitute data necessary to the design of the experiments on the reduction of ore by gases, and are a particularly essential pre-requisite to any attempt at an engineering application of the results.

Investigations at the Pittsburgh experiment station of the bureau on the technology of aluminum, include studies of causes for and prevention of cracks in aluminum-alloy castings; disintegration of aluminum-manganese alloys; analysis of aluminum and aluminum alloys; the contraction and shrinkage of aluminum alloys; and the effect of remelting aluminum alloys.

BRAZIL BUYS MACHINERY

Excavating Machinery Will Be Supplied for Rio de Janeiro Contract—Japan Closing on Heavy Rail Tonnage.

NEW YORK, Dec. 27.—There is but little change in the export situation as the year ends. Japanese buying continues at about the same level and Japanese export houses report numerous orders, principally for sheets, booked with American mills for delivery, c.i.f., Japanese ports, during the first quarter of 1922. Government purchasing of railroad material as well as private purchases is continuing up until the last days of the year. The Imperial Government Railways in Japan will decide this week upon the purchase of 13,000 tons of 60-lb. and 75-lb. rails and the Hanshin Electric Railways will close before Jan. 1 on 3500 tons of 100-lb. rails. Rails purchases in the United States by the Government railroads in Japan during the past year are estimated to have been in the neighborhood of 50,000 to 60,000 tons total.

Other foreign markets are generally quiet, although oil and other developments in South America have resulted in some inquiry from South American markets. Besides the development of the oil fields of the Comodoro Rivadavia in Argentina, discovery of some oil in the province of Antofagasta, Chile, has resulted in the formation of the Comunidad de Petroleos de Antofagasta. Oil fields in Santa Cruz, Bolivia, will probably be exploited by an American company formed for the purpose, according to the Bureau of Foreign and Domestic Commerce.

The Austin Machinery Corporation, 30 Church Street, New York, will supply the total equipment used in the removal of a hill in the city of Rio de Janeiro, Brazil. The work, which will be performed by Kennedy, Leonard & Co., New York, involves the removal of a hill in the city, covering about 145,000 square meters. The equipment used will total about \$12,000,000 and includes coal handling machinery, steam shovels, excavators, concrete mixers, trenching machinery, back fillers, cranes and gasoline locomotives. The Austin corporation recently booked an order for \$145,000 worth of road-making machinery for the city of Mexico, which included a tonnage of narrow gage track and six steam shovels.

In connection with the electrification of the Chilean State Railroad, operated by the Government of Chile, Santiago, Chile, the contract for which has been awarded to the Westinghouse Electric & Mfg. Co., 165 Broadway, New York, five electric power houses will be constructed for power supply, with estimated capacity of about 60,000, and feeder and operating lines for a distance of over 230 miles. The entire project is estimated to cost about \$6,500,000, and will require close to 24 months to bring to completion. The line will operate between Santiago, Valparaiso, Llay Llay and Los Andes. A total of 59 electric locomotives will be provided, averaging from 39 to 112 tons each.

NOTHING IS SETTLED

Such Is the Opinion of the Attorney for the National Lumber Manufacturers' Association as to Recent Decision

L. C. Boyle, counsel for the National Lumber Manufacturers' Association, has made an extended statement in regard to the recent decision of the Supreme Court of the United States in what is known as the Hardwood Lumber case, in which the majority opinion was delivered by Justice Clarke, with Justices Brandeis, Holmes and McKenna dissenting. Mr. Boyle's statement in part was as follows:

"The majority opinion adopts the theory as outlined by the Government in its briefs. It would be an idle thing for me at this time to quarrel with the opinion. That the majority of the court has reached an erroneous conclusion is to me manifest. In the nature of things that would be my natural reaction. The great and disappointing thing to me, however, is that the decision does not settle anything. It is true the court holds that this group of hardwood lumber manufacturers were in a conspiracy to restrain trade. However, no yardstick is laid down whereby other groups may find guidance. The great and outstanding thing that we urged the court to decide, to wit, Would it be lawful to gather and distribute statistics covering records of past sales, stocks on hand and production? is left in a confused and doubtful position. In a word, the court assembles all of the activities in which our group indulges, to wit, the publication of the market letter, the distribution of the questionnaire, the collection of sales and stock data, the holding of monthly meetings, and holds that these things comprehend the conspiracy; whereas it was our earnest appeal to the court to indicate what would be legal touching any of these activities as distinguished from what might be illegal as to any of them.

The Vital Element

"There is language in the decision that would indicate that our conduct might have been held legal had we not indulged in certain activities. In other words, if all we did was to collect statistics and distribute the same, such course might not have been held illegal. However, this vital element is left undecided and uncertain.

"There still remains an opportunity to have this question further considered by the Supreme Court. The rules of the court permit the filing of a petition for a rehearing during the term in which a decision is handed down; therefore, we will have opportunity to challenge to the court's attention matters of fact and law wherein it will be pointed out the opinion is in error.

"It may be of interest to here and in a very brief way call attention to certain of these items; it will be noted that the opinion adopts the Government's charge that the plan was designated to and did achieve curtailment of production, whereas counsel representing the Government in the first oral argument frankly admitted to the court that there was no evidence in support of the charge of curtailment and in the Government's original brief this phase of the Government's charge is formally abandoned. Of course, the Government was driven to this position due to the unquestioned state of the record. Nevertheless, the court's opinion is largely devoted to this curtailment phase and the conclusion is definitely asserted that as a part of the conspiracy curtailment of production was involved.

May Grant Rehearing

"I cannot help but feel that when the court's attention is definitely called to its error of conclusion as to this all-important item the petition to rehear will be granted. Again, the Government in its original oral argument formally admitted that it would not be illegal for a group of operators to gather and disseminate

statistical information when the same was done solely for informative purposes. Due to this admission, Mr. Todd and myself were justified in concluding that the court would at least recognize our right to gather and disseminate statistics when same was not done as a means for carrying out some kind of an illegal compact. However, as the court's opinion stands it is difficult to determine whether we would be permitted to do this thing and if it be the law that this would be permitted then the injunction of the lower court should be modified, whereas the lower court's injunction is sustained in all respects.

"One reading this opinion, and who is a stranger to the record would unquestionably get impressions that are not justified by the record itself, and it is just possible that the true state of this record has escaped the Court. To illustrate: In outlining the activities of the Association the Court reviewed the various items as stated in the paper plan as originally conceived. But the opinion does not in any place call attention to the fact that many of these activities were never put in play. For instance, the original plan provided for a daily shipping report; also for the exchange of price lists; also inspection reports. Now, none of these activities were ever indulged, and yet one who reads this opinion and who is not familiar with the facts would get the impression that these matters were involved in the working out of this claimed conspiracy.

Group Meetings

"Again, there were group meetings held throughout the territory wherein the members of the plan had their operations. In reading the opinion one would get the impression that all the members of the plan had gathered in group meetings once a week, or in other words, that the plan was so adjusted that there were constant elbow touch between all the co-operators, whereas the truth is, and concerning which there is no dispute, that during the whole life of the plan the 300 odd members never did meet in one meeting. These group meetings were held in the various territories for the convenience of the members. Those who lived close to one meeting place attended that meeting and not the others, and less than 50 per cent of the members attended any group meeting. However, one reading this opinion would get an entirely different understanding of this phase. It is possible that the Court itself has been misled.

"It may be recalled that in my oral argument I definitely stated that there were two items in which we were vitally concerned, to wit: the sale and stock reports. I urged the Court that if in its judgment it was illegal for an Association to send out market letters that sought to interpret statistics, would it be legal to gather and disseminate statistics without market letters or any comment? I conceived that this was a practical suggestion and as a lawyer I know I was entirely within my province in making same. Unfortunately, however, the Court does not directly and definitely decide the matter. In other words, it is difficult to determine, in the light of this decision, what the Court's opinion would be if there was nothing involved but the gathering and assembling of statistics covering past transactions. This was indeed the very heart of our law suit. The market letters, the questionnaire, the group meetings were but casual and of no moment.

Definite Guidance Lacking

"It is indeed unfortunate that the court did not give definite guidance so that those industries that have no common markets would know the legal limitations, because if the court did hold that under no circumstance could industry keep itself informed by means of associated effort, then Congress would have to relieve the situation.

"The problem will be carefully reviewed in our application for a rehearing and the members can depend upon it that all will be done that is possible. You can well understand that this opinion came as a distinct shock to me. The more I read the opinion the greater is my disappointment."

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic	\$0.35	Kansas City	\$0.815
Philadelphia, export	0.265	Kansas City (pipe)	0.77
Baltimore, domestic	0.335	St. Paul	0.665
Baltimore, export	0.255	Omaha	0.815
New York, domestic	0.38	Omaha (pipe)	0.77
New York, export	0.285	Denver	1.35
Boston, domestic	0.415	Denver (wire products)	1.415
Boston, export	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates	1.325
Cleveland	0.24	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail	0.555
Cincinnati	0.325	Jacksonville, rail and water	0.46
Indianapolis	0.345	New Orleans	0.515
Chicago	0.38		
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire, rope, cable and strands, 11c. wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 2 1/2c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/2 in. thick and over, and tees, structural sizes, 1.50c. to 1.60c. Shored plates, 1/4 in. and heavier, tank quality, 1.50c. to 1.60c.

Wire Products

Wire nails, \$2.50 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75; bright Bessemer and basic wire, \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.15; galvanized fence staples, \$3.15; painted barbed wire, \$2.65; polished fence staples, \$2.65; cement-coated nails, per cent keg, \$2.00 to \$2.10; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 68 to 70 1/2 per cent off list for carload lots, 67 to 69 1/2 per cent for 1000-rod lots, and 66 to 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 5 to 70, 10 and 7 1/2 per cent off list
Machine bolts, small, cut threads, 70 and 5 to 70 and 10 per cent off list
Machine bolts, larger and longer, 65, 10 and 5 to 70 and 10 per cent off list
Carriage bolts, 3/4 in. x 6 in.; smaller and shorter rolled threads, 65, 10 and 10 per cent off list

Cut threads, 65 and 10 to 70 per cent off list
Longer and larger sizes, 65 and 10 to 70 per cent off list
Lag bolts, 70 and 10 to 70, 10 and 5 per cent off list
Plow bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list
Other style heads, 20 per cent extra

Machine bolts, c.p.c. and t. nuts, 3/4 in. x 4 in.; smaller and shorter, 65 and 5 per cent off list
Larger and longer sizes, 65 per cent off list
Hot pressed sq. or hex. blank nuts, \$5.50 off list
Hot pressed nuts, tapped, \$5.00 to \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list
Semi-finished hex. nuts:

1/4 in. to 9/16 in. inclusive, 80, 10 and 10 per cent off list
Small sizes S. A. R., 80, 10, 10 and 10 per cent off list
3/4 in. to 1 in. inclusive, U. S. S. and S. A. E.

70, 10, 10 and 10 per cent off list
Stove bolts in packages, 80, 10 and 5 per cent off list
Stove bolts in bulk, 80, 10 and 7 1/2 per cent off list
Tire bolts, 65, 10 and 10 per cent off list
Track bolts, carloads, 3.25c. to 3.50c. base
Track bolts, less than carloads, 4.25c. to 4.50c.

Upset Square and Hex. Head Cap Screws

1/2 in. and under, 80 and 10 per cent off list
5/16 in. to 3/4 in., 80 and 10 per cent off list

Upset Set Screws

1/4 in. and under, 80, 10 and 5 to 85 per cent off list
5/16 in. to 3/4 in., 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.25 to \$2.40 base
Large boiler rivets, 2.35 to 2.50 base
Small rivets, 70, 10 and 5 to 70, 10 and 10 per cent off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$38; chain rods, \$38; screw stock rods, \$43; rivet and bolt rods and other rods of that character, \$38; high carbon rods, \$45 to \$50, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9/16-in. and larger, \$2.25 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/4-in. and 7/16-in., \$2.40 base; 5/16-in., \$2.40 base. Boat and barge spikes, \$2.40 to \$2.50 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, \$3.25 to \$3.50 base per 100 lb. Tie plates, \$2 per 100 lb. Angle bars, \$2.40 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package; 8-lb. coating, 1 C., \$9.60; 15-lb. coating, 1 C., \$11.80; 20-lb. coating, 1 C., \$13; 25-lb. coating, 1 C., \$14.25; 30-lb. coating, 1 C., \$15.25; 35-lb. coating, 1 C., \$16.25; 40-lb. coating, 1 C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.50c. to 1.60c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Butt Weld			Iron		
Inches	Steel		Inches	Black	Galv.
1/4	54 1/2	28	1/4 to 3/8	+ 3 1/2	+ 22 1/2
1/4 to 3/8	60	33 1/2	3/8	36 1/2	18 1/2
3/8	65	50 1/2	3/8	42 1/2	27 1/2
3/8	69	56 1/2	1 to 1 1/2	44 1/2	29 1/2
1 to 3	71	58 1/2			

Lap Weld			Lap Weld		
2	64	51 1/2	2	39 1/2	25 1/2
2 1/2 to 6	68	55 1/2	2 1/2 to 6	42 1/2	29 1/2
7 to 8	65	51 1/2	7 to 12	40 1/2	27 1/2
9 to 12	64	50 1/2			

Butt Weld, extra strong, plain ends			Lap Weld, extra strong, plain ends		
1/4	50 1/2	33	1/4 to 3/8	+ 4 1/2	+ 37 1/2
1/4 to 3/8	56	38 1/2	3/8	35 1/2	23 1/2
3/8	62	50 1/2	3/8	42 1/2	28 1/2
3/8	67	55 1/2	1 to 1 1/2	44 1/2	30 1/2
1 to 1 1/2	69	57 1/2			
2 to 3	70	58 1/2			

2	62	50 1/2	2	40 1/2	27 1/2
2 1/2 to 4	66	54 1/2	2 1/2 to 4	43 1/2	31 1/2
4 1/2 to 6	65	53 1/2	4 1/2 to 6	42 1/2	30 1/2
7 to 8	61	47 1/2	7 to 8	35 1/2	23 1/2
9 to 12	55	41 1/2	9 to 12	30 1/2	18 1/2

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh:

Lap Welded Steel		Charcoal Iron	
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/4 in.	41	1 1/2 to 1 3/4 in.	15
2 1/2 to 3 in.	52	2 to 2 1/4 in.	25
3 1/2 to 13 in.	57	2 1/2 to 3 in.	30
		3 1/2 to 4 1/2 in.	32

Standard Commercial Seamless Boiler Tubes

New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

Sheets

Prices for mill shipments on sheets of standard gage in carloads, f.o.b. Pittsburgh, follow:

New York

NEW YORK, Dec. 27.

As the year draws to a close practically all the markets are firm and the tone is optimistic. Buying of copper has slackened but prices are tending higher. The tin market is temporarily inactive but firm. A quiet demand pervades the lead market at steady prices. The zinc market is slightly easier, but the technical situation is satisfactory.

Copper.—While inquiries continue in good volume, buying has slackened temporarily, but the market maintains its strength both as to prices and sentiment. There are even indications of a possibility of a shortage developing in the not distant future, due to the heavy demand, both past and prospective, and to the extremely low operating rate of the mines. It will take some time for the mining of copper to develop and there is some fear that the rate may not equal the demand in the coming months. There has been no change in prices, electrolytic copper for prompt and early delivery being still quoted at a minimum of 13.87½c., delivered, or 13.62½c., refinery, with first quarter at 14c., delivered, or 13.75c., refinery. There are some producers who are out of the market even at these prices. Foreign demand continues excellent and the technical and statistical position of the market as a whole is reported as eminently satisfactory.

Tin.—The market for Straits tin has been extremely dull the past week and there has been practically no demand either from dealers or consumers. In fact some dealers have been offering the market down, but there is some question as to whether these have resulted in sales or whether those making the offers were really willing to sell. At any rate, no one appears eager to take up the offering. As a result of this situation quotations, while largely nominal, have been a little lower, with spot Straits quoted to-day at 32.75c., New York. The London market has been closed since Friday, including to-day, which is observed there as "boxing day," and the trend of the market on that side is impossible to ascertain. Arrivals thus far this month have been 3635 tons with 4765 tons reported afloat.

Lead.—Conditions are unchanged with demand steady and prices firm. Fair sized orders are reported for various lines of consumption and demand for January shipment has been better than usual at this time of the year. The leading interest continues to quote 4.70c., New York and St. Louis, while in the outside market the prevailing levels are 4.35c. to 4.40c., St. Louis, and 4.70c. to 4.75c., New York. Prospects of exports to England continue good.

Zinc.—Demand is very light, as is natural in the closing weeks of the year, and has resulted in offerings from one or two sources slightly under the market so that prime Western in limited amounts can be obtained as low as 4.82½c., St. Louis, or 5.17½c., New York. Interest in first quarter is of sufficient volume to warrant expectation of good business in the near future and there is even some prospect of exports to England. There has been a decided expansion of business in galvanized sheets in Great Britain, particularly for export, and there are indications that American zinc may be cheaper than some other for British makers of these

sheets. The technical situation of the market here is, however, satisfactory and pessimism does not prevail.

Antimony.—Wholesale lots for early delivery are quoted unchanged at 4.50c., New York, duty paid, with demand exceedingly light.

Aluminum.—The leading producer continues to quote virgin metal, 98 to 99 per cent pure, in wholesale lots for early delivery, at 19c., f.o.b. plant, but is probably meeting offerings of the same grade from importers at 17c. to 18c., New York, duty paid. Demand is very light.

Old Metals.—Business remains quiet but values are well sustained at the following quotations:

	Cents Per Lb.
Copper, heavy and crucible.....	13.25
Copper, heavy and wire.....	12.50
Copper, light and bottoms.....	10.00
Heavy machine composition.....	10.25
Brass, heavy.....	8.00
Brass, light.....	6.00
No. 1 red brass or composition turnings.....	8.25
No. 1 yellow rod brass turnings.....	6.25
Lead, heavy.....	4.25
Lead, tea.....	3.25
Zinc.....	3.00

Chicago

Dec. 27.—Tin and spelter have declined slightly while the other metals remain unchanged in a quiet market. Among the old metals brass and some grades of copper have advanced. We quote in carload lots: Lake copper, 13.75c.; tin, 33.75c.; lead, 4.45c.; spelter, 4.82½c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 8c.; red brass, 8.25c.; yellow brass, 5.75c.; lead pipe, 3.25c.; zinc, 2.37½c.; pewter, No. 1, 23c.; tin foil, 24c.; block tin, 26c.; all buying prices for less than carload lots.

St. Louis

DEC. 27.—Lead has been slightly easier at 4.30c. to 4.40c. car lots, while slab zinc was about steady at 4.85c. On old metals we quote: Light brass, 3.50c.; heavy red brass and light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; zinc, 2c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Industrial Health Measures in Cincinnati

"Industrial medicine is preventative medicine practised on the firing line" was the key statement of an article by Dr. Otto P. Geier, Cincinnati Milling Machine Co., Cincinnati, in the December issue of *Nation's Health*. The author is brother of Frederick A. Geier, president of that company. The article describes the Cincinnati Health Exposition held in that city recently. The exhibit contained booths representing the proper kind of shop surroundings and those containing the wrong kind; also many charts and posters. Machinists were at work in the good and the bad booths drawing attention to their work by the sparks from their emery wheels.

In describing industrial health conditions in Cincinnati the author says: "The collected data showed that almost invariably the sickness rate and absence because of sickness was materially reduced, some instances being cut in half; that lost time from infected wounds after installation of medical service, with its prompt and proper treatment, reduced infection cases to the negligible point. The effort to collect comparable statistics proved to the co-operating medical departments the necessity for standardizing their records and in the interest of determining what may reasonably be considered the irreducible minimum of record that will still furnish sufficient information for intelligent deductions as to monetary and other values of health work in industry.

"It was useful, for instance, to contrast the fact that while eight industries furnished 11,800 men, convenient clinical facilities for 250,000 visits in 1920, the out-patient department of the Cincinnati General Hospital, with its score or more of physicians and nurses, afforded but 10,000 patients clinical facilities for 30,000 visits. Even with free medical service the cost approximated \$20,000."

PERSONAL

Peter R. Foley, formerly general manager of sales Eastern Steel Co., and J. Harries Pritchard, at one time identified as operating superintendent of Republic

P. R. FOLEY

Iron & Steel Co., have taken over the Slatington Rolling Mills at Slatington, Pa., and will start operation about Feb. 1. The mill will be operated under the name of Foley Steel Co., with general offices at Slatington, Pa., and have its branch office in the Harrison Building, Philadelphia. It is the intention to manufacture merchant steel and iron bars of the following range of sizes: Rounds and squares, $\frac{3}{8}$ in. to 3 in.; flat bars, $\frac{3}{4}$ in. to 6 in. widths; reinforcing concrete bars, plain and deformed.

The company will also specialize on small steel special sections, low phosphorous muck bar for crucible steel mixtures, stay bolt iron, etc.

Mr. Foley has been connected with the iron and steel industry since boyhood and is widely known. He served 22 years with the pioneer bridge builders, Coffrode & Saylor, who operated the bridge works at Pottstown, Pa. (now owned by McClintic-Marshall Co.), also the Reading Rolling Mill Co., at Reading, Pa., rising with them from a minor position to treasurer of both companies. He was elected treasurer of the Eastern Steel Co. at its organization in 1902, served in that capacity until 1905, when he opened its sales office in Philadelphia, and subsequently, in 1915, was appointed general manager of sales, which office was recently abolished. He was in the service of the Eastern Steel Co. about twenty years.

Mr. Pritchard, the associate of Mr. Foley, descends from the early iron and steel men of the United States, his grandfather, John Pritchard, being a roller in the Pittsburgh mills back in the 40's and afterwards was one of the owners of the first rolling mill at Ironton, Ohio. Mr. Pritchard began his career in the Birmingham, Ala., district and was for many years superintendent of the Republic Iron & Steel Co. and the Tennessee Coal, Iron & Railroad Co.'s rolling mills.

James H. Hammond, for 24 years president Superior Steel Co., and for the past five years chairman of the board of directors Superior Steel Corporation, has resigned. Henry F. Devens, for many years associated with the Superior Steel Corporation, formerly vice-president and more recently as special agent, has severed that connection. Henry D. Sarge, secretary and assistant treasurer Superior Steel Corporation, has resigned from both positions and connection with the corporation. Frank R. Frost, assistant sales manager Superior Steel Corporation for the past few years, has severed his connection with the corporation. Messrs. Hammond, Devens and Frost have taken temporary offices at 565 Union Arcade Building.

Frank L. Campbell, formerly manager of sales of the roofing department of the Beaver Board Co., Buffalo, has resigned, and on Jan. 2, will accept the

position of general manager of sales of the United States Chain & Forging Co., Union Arcade, Pittsburgh. He succeeds Charles M. Power, who recently resigned.

B. A. Tozzer, who has been traveling in the Far East for the past 14 months, investigating the business outlook in respect to machine tools for the Niles-Bement-Pond Co., has returned to Cleveland and resumed his former position as manager of the Cleveland office of the Pratt & Whitney Co. and the Niles Tool Works Co. During his travels he visited India, Java, China, Burma, Siam, the Straits Settlement and other Far Eastern countries.

H. A. Kimber, formerly of the Quigley Furnace Specialties Co., is now in charge of the sales of the Quigley pulverized fuel department of the Hardinge Co., 120 Broadway, New York. This change was made owing to the acquirement by the Hardinge company of the pulverized fuel department of the Quigley company. L. W. Marso, who is in charge of the branch office of the Quigley company, at 427 Oliver Building, Pittsburgh, has now become associated with the Hardinge Co., 120 Broadway, New York, and will continue in the Pittsburgh office under the name of Hardinge Co., but will specialize in the handling of the Quigley pulverized fuel systems, which department has been acquired by the Hardinge Co. from the Quigley company. O. M. Rau, formerly consulting engineer to the Philadelphia Rapid Transit Co., has also joined the Hardinge Co., and will specialize in the handling of Quigley pulverized fuel systems as applied to boilers. W. O. Renkin has affiliated with the Hardinge Co. as managing engineer of the Quigley pulverized fuel department.

George C. Calvert, purchasing agent of the American Road Machinery Co., Inc., Kennett Square, Pa., was installed president of the Purchasing Agents' Association of Philadelphia at the annual meeting held at Kuglers on Dec. 8. This association is in a thriving condition, having a membership of 250, although it was only organized about six years ago.

A. H. Bauman has been elected vice-president and director of the Cleveland Duplex Machinery Co., Cleveland. He was formerly general foreman of the gun division, the American Brake Shoe Works, Erie, Pa. For the past three years he has been associated with the Cleveland Duplex Machinery Co. as sales engineer.

Arthur J. McMasters, 819 Bessemer Building, Pittsburgh, has been appointed sales representative in the Pittsburgh district for the Storms Drop Forging Co., East Springfield, Mass., and the Brown Bag Filling Machine Co., Fitchburg, Mass. In addition to the above, Mr. McMasters is also sales representative in the Pittsburgh district for the Bickford Switzer Co., Greenfield, Mass.; Alert Tool Co., Philadelphia; Gammons Holman Co., Manchester, Conn.; Welded Products Mfg. Co., Milwaukee; Rigid Tool Holder Co., Washington; Arnold Electric Tool Co., New London, Conn.; Superior Saw Mfg. Co., Long Island, N. Y.; Velco Mfg. Co., Greenfield, Mass.; Van Keuren Co., Boston, and the Geneva Society of New York and Switzerland.

B. H. Anibal, formerly chief engineer Cadillac Motor Car Co., Detroit, has been appointed chief engineer of the Peerless Motor Car Co., Cleveland.

J. E. Holveck has been appointed district sales representative for the rotary pump line of the Exeter Machine Works, Inc., West Pittston, Pa., in the Pittsburgh district. Until recently he was with Crawford & Cameron, Pittsburgh, and was at one time designing engineer for the Aldrich Pump Co., Allentown, Pa. Mr. Holveck is a hydraulic engineer with extensive experience in the design and sale of pumping machinery, and is the patentee of novel and interesting improvements applicable to high-pressure pump work.

William S. Dickson has been appointed assistant manager of the Crane Machinery Co., Buffalo, N. Y. For many years he was with the Cincinnati Planer Co. and later became sales engineer of the Acme Machine Tool Co., and general manager of the Greaves-Klughman Tool Co. During the past two years he has been connected with the Cleveland office of W. K. Stamets.

J. H. PRITCHARD

OBITUARY

THOMAS MURRAY, assistant secretary, assistant treasurer and director of the United States Steel Corporation, died Nov. 27, aged 54, after a long illness. Mr. Murray was born in Jersey City, Dec. 14, 1867, attended public school and high school in Jersey City and began work in a law office at the age of 14. He became connected with the Federal Steel Co. in May, 1894, and was appointed assistant secretary of the United States Steel Corporation upon its organization in April, 1901. On Nov. 11, 1919, he was appointed assistant treasurer. He had been a director for about eight years and was also a director of many of the subsidiary companies of the Steel Corporation. On June 23, 1897, he married Miss Mary C. Flynn of Jersey City, who survives. He was a member of the Railroad Club and of a number of social clubs. Judge Gary said of him Tuesday: "He was a man of high character, more than ordinary ability, trusted and beloved by all his associates in the Steel Corporation and its subsidiaries."

THOMAS MURRAY

NELSON S. BARTLETT, retired iron merchant, died at the home of his sister at 227 Commonwealth Avenue, Boston, Dec. 23. He was born in Boston, April 11, 1848. During his earliest business life, Mr. Bartlett was associated with the Hondlette, Ellis & Co., Boston, iron and steel merchants. When the affairs of that company wound up, he started in business for himself as an importer of Scotch and English pig iron, rails, beams, etc. Later, he formed a partnership with George H. Curtis, as N. S. Bartlett & Co., and employed John O. Henshaw, then secretary of the Boston Bridge Works, as salesman. Approximately four years later Mr. Henshaw was taken into the firm and a few years later Mr. Curtis retired from the partnership. At this time the firm sold Mary, Ohio, Scotch pig iron, made by the Mary furnace, Louisville, Ohio, in connection with Scotch irons. In addition, it sold Rebecca iron, made at Kittanning, Pa., by the Kittanning Iron & Steel Mfg. Co. The firm also acted as agents for other irons, notably Woodward and Crozier. The firm's office was at 126 State Street, Boston. In 1909, Mr. Bartlett retired from active business devoting his entire attention to the management of several estates. The firm was dissolved and the business absorbed by Hickman, Williams & Co. Mr. Bartlett was a member of Boston's oldest clubs.

DOUGLAS F. MCKEY, secretary-treasurer Durant Mfg. Co. and American Filter Mfg. Co., 655-665 Buffum Street, Milwaukee, died Dec. 13 after a brief illness with pneumonia, at the age of 33 years.

FRANK J. TURK, Joseph Turk Mfg. Co., Bradley, Ill., bedsteads, died on Dec. 12.

ANTON MILL, SR., president A. Mill Engineering Co., Cincinnati, died at his home in that city on Dec. 20, at the age of 72 years. He had been in the engineering business for more than 20 years. Previous to organizing the company which bears his name, Mr. Mill had an interest in the old Bickford Machine Tool Co., Cincinnati.

CHARLES M. BEGOLE, president of Chevrolet Motor Co. and one of the founders of the Buick Motor Co., died at St. Petersburg, Fla., Dec. 22. Mr. Begole, a son of the late Josiah Begole, former Governor of Michigan, was 73 years old. His home was in Flint, Mich.

THOMAS FINDLEY, president Massey-Harris Co., To-

ronto, Ont., died at his home, 146 Warren Road, Toronto, Dec. 19. He had been in poor health for the past year, and had been forced to take to his bed five weeks ago. A year and a half ago he resigned to Thomas Bradshaw the duties of general manager of the Massey-Harris Co. He became associated with the Massey-Harris Co. in 1890, at that time holding the position of telegraph operator. In 1895 he became chief accountant, in 1902 assistant to the president, in 1907 assistant general manager, in 1909 a director, in 1912 vice-president and in 1917 president and general manager. He was 52 years old.

Car Loadings Decline

Revenue freight loadings for the week ended Dec. 10 showed 742,926 cars in use, a decrease for the week of 4528 cars, 95,027 cars less than the same week last year, and 12,014 cars below the showing of two years ago. Were it not for the heavy traffic in grain and grain products and seasonal increase in merchandise loadings, the showing as compared with previous years would be much worse. The main losses are attributed to the coal movement, which is showing heavy losses, despite the reduced temperatures for a large part of the country. The output of the mines is small and stocks at terminal markets, while not regarded as heavy, appear sufficient for the time being. Every Western road is storing cars of all kinds; even box cars on a few roads are in excess supply, in the face of the big movement of corn which is the largest at this time in years.

Exports Decline

WASHINGTON, Dec. 27.—American exports to Europe declined \$43,000,000 in November as compared with the previous month, according to an official summary of foreign trade issued to-day by the Department of Commerce. Imports from Europe increased in the same period about \$3,500,000.

Only to Africa and Oceania was the outgoing trade of the United States greater in November than in October, the increase in the case of Africa being \$700,000 and to Oceania \$3,400,000.

Initiative Lies With Europe

WASHINGTON, Dec. 27.—Any initiative in the matter of economic conferences must come from Europe, it was indicated to-day by American officials. The American view is that European nations have the primary responsibility for their own reconstruction and that the United States cannot advisedly propose remedies or institute international negotiations unless the nations most chiefly concerned have acted.

"Underground Loading Devices in Metal Mines" by C. Lorimer Colburn, mining engineer of the United States Bureau of Mines, is the subject of a short bulletin issued by the bureau, in which are given descriptions, operating methods and the performances of mechanical shovels now in use in metal mines of the United States. The machinery considered includes the following: Hunt rotary shovel, Myers-Whaley shoveling machines, Conweigh digger belt-loader and Conweigh shovel loader, Shoveloder, Armstrong shovel, Thew underground mining shovel, Marion shovel, Hoar underground shovel, Keystone excavator and various developments of scrapers and slushers.

C. F. Yocum, general foreman Buckeye Traction Ditcher Co., Findlay, Ohio, has been appointed superintendent to succeed L. A. Krupp, who resigned to accept the position of manager with the North Baltimore Tractor & Machine Co., North Baltimore, Ohio.

Percival Johnson, president Pulaski Iron Co., Philadelphia, was elected president of the Virginia Pig Iron Association at its monthly meeting on Dec. 20.

BOOK REVIEWS

Waste in Industry. By the Committee on Elimination of Waste in Industry of the Federated American Engineering Societies. Pages 409, 6 x 9 in. Published by the Federated Engineering Societies, Washington, and for sale by the McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, \$4.

This volume of over 400 pages presents the results of the first public service undertaken by the Federated American Engineering Societies. This service was a rapid, intensive study by Herbert Hoover and seventeen engineers appointed by him as the Committee on Elimination of Waste in Industry, of conditions making for inefficiency and lost production in a large number of representative plants in six typical branches of industry.

Waste, in the sense here used, is the complement of the efficiency ratio. If 100 per cent represents the maximum of productive capacity, and in a given plant but 70 per cent efficiency is attained, the lost 30 per cent represents the waste. In order to obtain a fair summary of the conditions, a standard questionnaire was first developed. This was classified under three heads. The first, organization, dealt principally with management and labor. The second, technical, dealt with the plant equipment, materials, and products, and the degree of accurate knowledge available to control these factors. The third, utilization, covered the operating practices with respect to financing, cost keeping and production control. The results are stated in "points" of waste, on a scale grading from excellent at zero through fair at 40, to bad at 80.

The summarized points of waste are for the building trades an average of 53; men's clothing trade, best plant, 27, and worst, 83; boot and shoe trade, best 12½, worst 71; printing shops, an average of 60; and textile trades, an average of 50. The showing in the metal trades is undoubtedly of the most interest to the readers of *THE IRON AGE*. The best of the shops studied showed only about 6 points of waste, and the highest figure was 56, with an average of 30.

The greatest cause of waste in industry appears to be fluctuation in the rate of work. This is seasonal, or due to changes in style or fashion, or to irregularity in receiving materials, or in working them through the departments, or to the various causes that make a labor turnover of 60 per cent remarkably good, and the condition of having to hire ten persons to keep one at work only too common. Overhead, interest and other charges are the same whether a machine works full time or only half time; and with the large proportion of idle machine time that exists in almost all shops, there is no more direct route to increased dividends than to find ways of keeping the machines at work.

The book contains also reports on general causes of waste in industrial production, such as unemployment, strikes, accidents and loss by ill-health of workers. Much useful information for the statistician and the student of economics is here available. But the practical manufacturer who takes up "Waste in Industry" in the expectation of finding a ready remedy for the waste within his own plant, is likely to be disappointed when he discovers that nowhere in the four hundred pages is there a chapter entitled "How to Reduce Waste in Industry." S. H. B.

Hendricks' Commercial Register of the United States.—Pages 2324, 8½ x 11½ in. Published by S. E. Hendricks Co., 70 Fifth Avenue, New York.

A conspicuous feature of the new issue of Hendricks' Commercial Register is the change in size to conform to 8½ x 11½-in. size. This gives a type page of 7 x 10 in., instead of 6 x 8 in., and allows 25 per cent more matter on each page than formerly. Under ordinary conditions this change in size would reduce

the number of pages 25 per cent, or from 2800 to 2100. Sufficient material has been added, however, to make the total number of pages in excess of 2300. The resulting reduction in the thickness makes the book easier to handle, notwithstanding that it contains more material than any previous edition. The text matter has been opened up, leaving a space between columns, which contributes to easier reading and allows space for check marks and short memoranda.

The lists given cover the electrical, engineering, machinery, building and other industries. The lists covering twist drills, fire doors and electric lamp sockets have been handled more comprehensively than usual.

Books Received

Mineral Industry During 1920. Vol. xxix. Edited by G. A. Roush. Pages xx + 907; 6¼ x 9¼ in.; numerous tables and illustrations. Published by the McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, \$10.

Coal Manual. By F. R. Wadleigh. Pages 200, 4¼ x 6 in. Published by *National Coal Mining News*, 834 Union Trust Building, Cincinnati, Ohio. Price, \$2.50.

A Course in Mechanical Drawing. By Louis Rouillon. Pages 92, 6½ x 7½ in.; fully illustrated. Published by the Norman W. Henley Publishing Co., 2 West Forty-fifth Street, New York. Price, \$1.50.

Short Trade Items

The Combustion Engineering Corporation, New York, has opened a new branch office at 806 First National Bank Building, Pittsburgh, in charge of W. C. Stripe, formerly manager of the Philadelphia office.

A new metal stamping company has just been formed under the name of The Winkler Mfg. Co., Inc., 248 Lafayette Street, New York. This company is in charge of Jack Winkler, formerly in charge of estimates of the Charles Fishers' Spring Co. Mr. Winkler has been specializing in combination dies for the past ten years, and is ready to estimate on metal stamping in all its branches. The Winkler Mfg. Co. also owns some patents, which it is manufacturing, among which are a sanitary tooth brush holder and a ticket dispensing machine.

The Wilson Welder & Metals Co., has moved its general offices and Bush Terminal factory to 132 King Street, New York, telephone Spring 7994. It has installed improved special equipment to handle certified plastic arc welding metals more efficiently, including a fully-equipped demonstration room where is displayed the Wilson plastic arc system, the one that was used to repair the intentionally damaged interned German ships.

Sidney Norwood, who for a great many years has been selling in Michigan the product of the Interstate Iron & Steel Co., Griffin Mfg. Co. and Massillon Rolling Mill Co., is going into business for himself as a manufacturers' agent and will handle, among other lines, the account of the Elliott-Blair Steel Co., New Castle, Pa., in the state of Michigan. His office is at 912 Kresge Building, Detroit.

The Boston office of the Cutler-Hammer Mfg. Co., Milwaukee, has been moved from the Columbian Life Building to rooms 403 and 404 Harvey Building, Chauncy Street. C. W. Yerger is manager.

The York Modern Corporation, Unadilla, N. Y., incorporated with a capital of \$30,000, will manufacture road building machinery. It will rent a factory for the first year.

The Lebanon Steel Foundry, Lebanon, Pa., has purchased the plant of the Rivetless Chain & Engineering Co. at Lebanon, which will be incorporated under the name of the Lebanon Drop Forge Co. The plant is complete in every respect and while the new owners have plans for enlarging it and adding to the equipment, they will not do so at the present time.

The Keller Pneumatic Tool Co., Grand Haven, Mich., has changed its name to William H. Keller, Inc.

A. Lewinsohn & Sons, 61 Broadway, New York, are having plans prepared and will soon take bids for the erection of a two-story automobile service and repair building, 50 x 60 ft., at Broadway and 185th Street, estimated to cost \$90,000. John De Hart, 1041 Fox Street, is architect and engineer.

Machinery Markets and News of the Works

HOLIDAY PERIOD ACTIVE

Delaware & Hudson Has New Inquiry for Seven Machines

American Woolen Co. Purchased 18 Tools—New England Machinery Market Is Especially Active

The holiday period is proving to be less dull than in many years. It is reported from New England that sales the past week have been three times as great in volume as any other one week this month; furthermore, that December has been a better month than November and that August was decidedly the turning point of the year.

The Delaware & Hudson Railroad, Albany, N. Y., has put out an inquiry for seven tools. Purchases expected after Jan. 1 include those by the Rock Island, the Santa Fe and the Delaware, Lackawanna & Western railroads. The purchasing department of the last

railroad has passed on the 40 tools asked for and approval must now be secured from the finance board. The Rutland, Bangor & Aroostook and the Maine Central each have small lists under consideration, but appropriations for their purchases have not been made.

The American Woolen Co. has bought 18 machine tools for its Shawsheen machine shop, the order having been placed with two houses. One of the largest orders in the Middle West was that placed by the Beatty Machine & Mfg. Co., Hammond, Ind., which company has a contract to supply complete equipment for the Richmond Car Co., Richmond, Va. The Junior High School of South Bend, Ind., closed for seven South Bend lathes. The Phoenix Horse Shoe Co., Joliet, Ill., has purchased three good-sized tools for its Poughkeepsie, N. Y., plant, and contemplates a boring mill.

A few inquiries from France are being turned to Cincinnati builders, but the unfavorable exchange has made immediate business unlikely. A New Hampshire city is making up a list of shop equipment for a new school involving about \$30,000 worth of machinery.

New York

NEW YORK, Dec. 27.

The Delaware & Hudson Railroad, Albany, N. Y., has issued an inquiry for the following machines:

- One 60-in. planer.
- One 42-in. boring mill.
- One 30-in. lathe.
- One flanging press.
- One forcing press.
- One driving-wheel press.
- One double-head shaper, 26-in. x 12-ft.

It is expected that purchases will be made by the Delaware, Lackawanna & Western Railroad within a week or two weeks. The purchasing department has passed upon the quotations received on its list of about 40 tools, and if the finance board approves of the purchase the orders will go out shortly. Additional inquiries for a few tools have been sent out, including a lathe, frog and switch planer.

Holiday dullness pervades the machine-tool market, but improvement is looked for after Jan. 1.

The Bullard Machine Tool Co., Bridgeport, Conn., reports a decided improvement in its business during December. A considerable number of orders have been received, including one early in the month for eight multi-automatic machines.

The crane market is dull, but prospects for real activity in January and February are generally considered good. Second bids on the 34 gantry cranes for the New York city docks at Stapleton, S. I., were opened Dec. 21. The low bid was presented by the Wellman-Seaver-Morgan Co., which quoted \$276,268 or \$8,125 each against its former bid of \$339,873 or \$9,996.26 each. Hoyt & Patterson, previously the low bidder with a price of \$301,348 or \$8,862 each, quoted on the new opening \$280,228 or \$8,242 each. Only three other companies submitted bids: McMyler Interstate Co., \$317,934; the Niles-Bement-Pond Co., \$345,950, and the Dravo Contracting Co., which was high, \$350,710.

Among recent sales are: Cleveland Crane & Engineering Co., a 2-ton, 20-ft. span overhead traveling crane with hoist to the Laurel Lumber Co., Laurel, Del., and a 2-ton tramrail with 400-ft. travel to the John F. McGowan Marble Co., 23 East 107th Street, New York; Champion Engineering Co., a 5-ton, 32-ft. span overhead traveling crane to the Union Tool Co., Carnegie, Pa.; Shepard Electric Crane & Hoist Co., a 2-ton, 30-ft. span, single I-beam crane to the Burnham Boiler Works, Irvington, N. Y.; Linde & Griffith, Inc., Newark, N. J., has purchased a 30-ton, 50-ft. boom, second-hand Browning locomotive crane from Philip T. King, 30 Church Street, New York. The Booth Brothers & Hurricane Isle Granite Co., 208 Broadway, New York, recently in the market for a locomotive crane has purchased a 15-ton second-hand Industrial for its Vermont quarry.

The Slatery Engineering & Construction Co., 10 East Forty-third Street, New York, has purchased property, 50 x 100 ft., on Inwood Avenue, for the erection of a new plant.

The J. L. Hammett Co., 55 Thirty-third Street, Brooklyn, manufacturer of school equipment, will soon take bids for a new four-story plant at Newark, N. J., estimated to cost \$100,000. Arthur C. Holden, 101 Park Avenue, New York, is architect.

Vocational departments will be installed in the high schools to be erected by the Board of Education, 500 Park Avenue, New York, on Second Avenue, between Sixty-seventh and Sixty-eighth streets, and at Amsterdam Avenue and 183d Street, respectively. The first noted will be five-stories, 128 x 136 ft., estimated to cost close to \$1,000,000; and the other, four-stories, 195 x 300 ft., to cost about \$250,000. Anning S. Prall is president of the board. C. B. J. Snyder, Room 2800 Municipal Building, is architect.

The G. Piel Co., Steinway and Jackson avenues, Long Island City, manufacturer of automobile equipment, has leased the brick factory on an adjoining site for extensions.

The American Smelting & Refining Co., 120 Broadway, New York, has preliminary plans under way for the erection of a large metallurgical experimental plant at El Paso, Tex., to be used for ore testing, etc.

The Brooklyn Edison Co., 360 Pearl Street, Brooklyn, will call for bids early in February for its electric generating plant at the foot of Sixty-sixth Street, estimated to cost about \$1,200,000. Plans are being prepared. G. L. Knight, company address, is engineer.

Albert Kellar, 1744 Garfield Street, Bronx, New York, will commence the erection of a one-story ice plant, 60 x 100 ft., at 409-15 East 108th Street, estimated to cost about \$30,000.

Sutliff, Inc., Maiden Lane, Kingston, N. Y., will take bids at once for a two-story automobile service and repair works, 60 x 100 ft., estimated to cost about \$42,000. W. Sutliff is president.

The Cornwall Industrial Corporation, Cornwall Landing, N. Y., has had plans prepared for a new one-story plant, 50 x 180 ft. E. L. Olson is superintendent.

Fire, Dec. 13, destroyed the forge shop and wagon works of Joseph J. LaCompte, 64-66 Hoosick Street, Troy, N. Y., with loss estimated at about \$16,000. It is planned to rebuild.

The New York Central Railroad Co., New York, will continue in the direct management of its car and locomotive shops at Elkhart, Ind., and will not lease the plant to private interests. The shops have been giving employment to about 500 men.

The Keystone Tire & Rubber Co., 1877 Broadway, New York, will operate the new plant of its subsidiary organization, the Gryphon Tire & Rubber Co., now in course of erection, for the manufacture of Keystone cord tires with a daily output of about 1000.

The Long Island Lighting Co., 50 Church Street, New York, operating at Northport, L. I. and vicinity, has made application to build a new electric power plant at Southold, L. I. E. L. Phillips is president.

The Transcontinental Oil Co., 576 Fifth Avenue, New York, with refineries at Tulsa, Okla., is planning for extensions and improvements in its plants, including new machinery and the purchase of new properties. Stockholders have approved a bond issue of \$10,000,000, and a portion of the fund will be used for this purpose.

Fire, Dec. 22, destroyed a portion of the five-story factory at 49-71 Clymer Street, Brooklyn, occupied by Charles Leffler & Co., machinists; the Kay Co., manufacturer of springs and other industrial interests with loss estimated at about \$25,000.

The Pennsylvania Motors Corporation, care of H. W. Scofield, 1719 North Broad Street, Philadelphia, will take bids until early in January for its one-story plant at Pleasantville, N. J., 50 x 300 ft., with power plant. It is estimated to cost close to \$125,000. C. Donehower, Pleasantville, is architect.

Christian Feigenspan & Co., 50 Freeman Street, Newark, N. J., have filed plans for a one-story ice plant at Blahop and State streets, Jersey City, N. J., estimated to cost \$25,000. It is preliminary to a large plant.

Electric motors and other equipment will be installed in the one-story plant, 100 x 150 ft., to be erected by S. Denier & Son, 15 Crosby Street, New York, at West New York, N. J., for the manufacture of mirrors, etc., estimated to cost about \$50,000.

Fire, Dec. 21, destroyed the plant of the Heidelberg Casket Co., Hudson Boulevard and Fifth Street, North Bergen, N. J., with loss estimated at \$100,000, including machinery.

A vocational department will be installed in the three-story high school to be erected by the Board of Education, Madison, N. J., estimated to cost \$500,000. Preliminary plans are being prepared by Guilbert & Betelle, 546 Broad Street, Newark.

Bids will soon be asked for the erection of a two-story high school, 150 x 370 ft., to include a vocational department, by the Board of Education, Elizabeth, N. J., estimated to cost about \$700,000, including equipment. C. Godfrey Poggi, 275 Morris Avenue, is architect.

A manual training department will be installed in the addition being erected at the high school, Perth Amboy, N. J., and which is expected to be ready for the installation of equipment early in the spring. It will cost in excess of \$150,000.

New England

Boston, Dec. 27.

The outstanding feature of the New England machine tool market the past week was the purchase of 18 tools by the American Woolen Co. for its Shawsheen machine shop. The order was given to two local houses, a 30 in. planer, keyseater, 1 1/2-in. bolt cutter, two 11-in. lathes, one 36-in. lathe, one universal tool grinder and a No. 2 universal milling machine going to one firm, and a 200-lb. hammer, 28-in. upright drill, sensitive drill, a 30-in. gear cutter, centering machine, wet tool grinder, 20-in. shaper, power hack saw, small speed and an 18-in. lathe going to the other. This purchase, together with others the past week, served to put the aggregate New England sales for December well above those for November and substantiate the belief that a turning point in the machine-tool market came in August. Sales each month since then have shown an increase over the preceding month.

With few exceptions, other sales concern single tools, but in the aggregate amount to approximately three times those for any previous week this month, and cover a wider assortment of equipment. They are about equally divided between new and used tools, and include a used 22-in. planer and a 20-in. x 8-ft. lathe to a Lakeport, N. H., interest; a used No. 3 Becker milling machine to a Riddelford manufacturer; a used four-spindle drill to a Salmon Falls, N. H., shop; a new 15-in. x 6-ft. semi-quick change lathe to a Roxbury maker of bearings; a 9-in. x 4-ft. lathe to a greater Boston garage, this tool passing through the hands of two dealers; a used 26in. planer to a Brockton concern; two profflers to a western Massachusetts textile machinery maker; a used sensitive drill to a Worcester, Mass., manufacturer; a new 10 1/2-ft. gap shear, weighing about 12 tons, to a Boston iron and steel company, and a set of gages, 80 blocks, costing close to \$1,000, to a Massachusetts firm.

With the possible exception of some cranes, the consensus of opinion is that little machine tool business will be closed the last week of 1921. The local trade, at least, is hopeful regarding the outlook for the early part of 1922. It is believed the prospect of railroad buying early next year warrants serious consideration. The Rutland, the Bangor & Aroostook and the Maine Central railroads each have under consideration small lists of equipment, but appropriations have not been made. The most promising railroad list is that of the Boston & Albany, which is in formation. The company has made up a fairly large list of tools it

desires to discard and is inquiring on machines for replacement. Up to date it has practically decided on 16 or 18, including a driving wheel lathe, 2500-lb. hammer, shapers, and 16-in., 18-in., 20-in. and 27-in. lathes, some of the latter to be used on brass fittings work. During 1921, the Boston & Albany was practically the only New England carrier, whose purchases of machine tools amounted to anything. It has taken no definite steps regarding much needed equipment for 1922, but machine tool dealers are reasonably certain the company will be forced to take on some new machinery.

The replacement of quantity production machine tools is strongly favored by some large New England industrial plants. In addition, quite a volume of prospective business is under consideration by small manufacturers, both new and old. School business also should develop within the next three or four months. One New Hampshire city is making up a list of shop equipment it will need for a new school, involving \$30,000 of machinery, but the date for opening bids is yet remote.

No local sales of cranes are reported this week. For a small New Haven contract, namely, the placing of a new crane on the city dock, 12 firms submitted bids ranging from \$575 to \$1,100. Award was made to the New Haven Electric Co.

The Waltham Watch Co., Waltham, Mass., has secured a large order for speedometers, covering 1922 requirements, from the Packard automobile interests, for the new Little Six car. The watch company has covered on its die castings requirements for this order.

The Fire Chief Corporation, capitalized for \$100,000 has been organized by J. Franklin Wilkinson, Herbert W. Blake, C. L. Rice, William E. Lee and Marcus E. Osgood, all of Gardner, Mass., to manufacture toys and novelties. Manufacturing operations will first be carried on at the plant of the P. W. Lombard Chair Co., South Ashburnham, Mass.

The three-story factory of the Lally Column Co., Cambridge, Mass., was recently badly damaged by fire. The upper part of the plant was ruined, while the lower floors, housing \$30,000 to \$40,000 worth of machinery were damaged by water.

The American Metal Co., Railroad Avenue, Attleboro, Mass., will move its plant to Janesville, Wis. Several of the employees will go West with the company.

The Thompson-Copeland Co., Worcester, Mass., metal specialties, recently incorporated under Massachusetts laws, has leased manufacturing quarters at 28 Cherry Street. It will produce lock washers, cutter pins, stamped metal, special screws and several other lines as soon as special machinery can be built.

The Peck, Stow & Wilcox Co., Southington, Conn., hardware, is planning to add three units to its works, comprising a hardening and annealing unit, 67 x 180 ft., grinding, 54 x 155 ft., and a forge shop, 65 x 100 ft.

The Bidwell Co., 1293 Main Street, Hartford, Conn., will build a two-story and basement garage and service station 75 x 122 ft., at East Hartford, Conn., to cost approximately \$150,000.

W. J. Hyland, 153 Dwight Street, Springfield, Mass., plumbing contractor, will erect a two-story and basement manufacturing unit, 50 x 95 ft., at 128 Liberty Street.

The London Steam Turbine Co., Troy, N. Y., has incorporated under Massachusetts laws, having acquired the rights and property of the Steam Motors Co., Springfield, and will manufacture steam turbines and appliances. It has an authorized capital of 10,000 shares preferred stock, par \$50, and 25,000 shares common, no par. William J. A. London, 70 Grenada Terrace, Springfield, is president. Carlos DeLeon, 303 Main Street, Springfield, vice-president, and Arthur J. Skinner, 46 Longmeadow Street, Longmeadow, treasurer.

The Service Engineering Corporation, capitalized for \$50,000 preferred stock and 10,000 shares common, no par value, has been granted a Massachusetts charter to manufacture automobile accessories at 568 East First Street, South Boston. Arthur L. Lewis, Newton, is president; Carroll W. Prochaska, Norwalk, Conn., vice-president and Frederick J. Shepard, Jr., Auburndale, treasurer.

C. N. James, 139 Brookline Street, Cambridge, Mass., manufacturer of automobile wheels, has broken ground for a one-story brick addition, 100 x 122 ft., estimated to cost about \$50,000. The machinery will be electrically operated, with individual motor and belt drive. Contract has been arranged for a supply of commercial power.

The New England Tank & Tower Co., Main Street, West Everett, Mass., is planning to rebuild the portion of its works destroyed by fire, Dec. 15, with loss estimated at about \$25,000.

The Cumberland County Power & Light Co., Portland, Me., has tentative plans for a new steam-operated electric generating plant, for auxiliary service, estimated to cost close to \$1,000,000.

A vocational department will be installed in the new

high school to be erected by the Board of Education, Winsted, Conn., estimated to cost \$150,000. Coffin & Coffin, 522 Fifth Avenue, New York, are architects.

The Union Specialty Co., 133 Hurd Avenue, Bridgeport, Conn., has plans under way for a new two-story factory, 50 x 125 ft., estimated to cost about \$50,000.

The Clark Power Co., Lewiston, Me., will commence the immediate erection of a new hydroelectric generating plant at the Union Falls on the Saco River. It will have an initial capacity of 22,000-h.p., which will be increased later. The entire development is estimated to cost in excess of \$1,000,000.

A vocational department will be installed in the two-story and basement high school, 120 x 242 ft., to be erected at Greenfield, Mass., estimated to cost \$500,000. L. C. Patton, 597 Fifth Avenue, New York, is architect.

The Clarendon Garage Corporation, Boston, has leased the three-story building at 48-58 Warren Avenue, totaling about 12,500 sq. ft., for the establishment of an automobile repair shop and service works.

Electric motors and other equipment will be installed in the two-story addition to be erected by the Acushnet Saw Mill Co., River Road, New Bedford, Mass., 60 x 80 ft., estimated to cost about \$35,000 with machinery. C. C. Smith is superintendent.

Ground will be broken at once by the Board of Education, Everett, Mass., for a three-story high school, 176 x 209 ft., to include a vocational department, estimated to cost about \$425,000.

Philadelphia

PHILADELPHIA, Dec. 27.

The Philadelphia Steam Heating & Engineering Co., Juniper and Cherry streets, Philadelphia, will take bids in about 60 days for a new two-story plant, 60 x 120 ft., at 3316-20 Lancaster Avenue, estimated to cost about \$60,000.

The Roth-Buick Co., Frankford Avenue, Philadelphia, has awarded contract to George W. Crossley, Bridge and Tacony streets, for a one-story and basement automobile service and repair building, at 4653-4659 Paul Street. Work will commence at once.

The United States Shipping Board, Washington, will soon commence dismantling a portion of the plant of the Merchant Shipbuilding Corporation, Bristol, Pa. Cranes and crane runways, yard equipment and other machinery will be placed on the market, it is said, at an early date. The Merchant company will continue to operate at the plant for some time to come.

The Middletown Ice Co., North Union Street, Middletown, Pa., is considering plans for a one-story addition to its ice manufacturing plant.

Electric motors and other power equipment will be installed in the three-story printing plant, 50 x 100 ft., to be erected by the Central Publishing Co., 329 Market Street, Harrisburg, Pa., at Thirteenth and Walnut streets, estimated to cost about \$150,000.

A one-story power plant will be constructed by the Taubel, Scott & Katzmiller Co., Shamokin, Pa., as its local textile mills. Plans have been completed.

The Vulweld Rubber Co., Pottstown, Pa., manufacturer of automobile tires, has acquired property on West High Street, 300 x 392 ft., for a new two-story plant, 60 x 260 ft., plans for which are being prepared. A one-story storage building will be built also.

Fire, Dec. 22, destroyed a portion of the power house of the Pennsylvania Power & Light Co., Allentown, Pa., at Danville, Pa., with loss estimated at about \$100,000, including equipment. It will be rebuilt.

Buffalo

BUFFALO, Dec. 27.

Freight handling, conveying machinery and other equipment will be installed in the five-story warehouse to be erected on the Niagara River, North Tonawanda, N. Y., at a cost of about \$250,000, by the McDermott Steel Co., North Tonawanda. The company has been organized recently with a capital of \$500,000 and is headed by T. J. McDermott, president; George Clinton, Jr., secretary, and H. M. Bone, treasurer.

A one-story automobile repair and service building, 40 x 140 ft., will be erected by the General Baking Co., 392 North Street, Rochester, N. Y. Gordon & Kaelberr, Sibley Building, are architects.

Fire, Dec. 20, destroyed a portion of the plant of the Stanford-Crowell Co., 1001 West Seneca Street, Ithaca, N. Y., manufacturer of cardboard specialties, with loss estimated at close to \$100,000, including machinery.

The Electro Refractories Corporation, Ellicott Square, Buffalo, manufacturer of crucibles, etc., is completing foundation work and will soon commence the erection of the

superstructure for its new plant at East Hamburg, 50 x 300 ft., with machine shop extension, 30 x 75 ft. It will cost about \$200,000, and will replace works recently destroyed by fire. L. U. Milward is manager.

The Jamestown Metal Desk Co., Blackstone Avenue, Jamestown, N. Y., will soon break ground for a one-story addition, 80 x 100 ft., estimated to cost approximately \$40,000. Beck & Tinkham, Frick-McGee Building, are architects.

Fire, Dec. 14, destroyed the plant of the J. B. Carr Co., Fourteenth Street, Colonie, N. Y., manufacturer of heavy chains and other mechanical products, with loss estimated at \$40,000. Preliminary plans are said to be under way for rebuilding.

Chicago

CHICAGO, Dec. 27.

The Rock Island and the Santa Fe will not take action on their respective lists until January. The latter road has sent out an additional inquiry for a 48-in. x 48-in. x 12-ft. planer with two heads on the cross rail and one head on the side. It is reported that the Union Pacific is about to issue an extensive list, but this has not been confirmed. As the year closes the market is quiet, new inquiries being few and orders largely small and infrequent. One of the largest orders recently taken was booked by the Beatty Machine & Mfg. Co., Hammond, Ind. This company has the contract to supply complete equipment for the plant of the Richmond Car Co., Inc., Richmond, Va. Included are large plate shears and multiple, single, double and horizontal punches which will keep the Beatty plant running at capacity for three and one-half months. In addition, the Beatty company purchased to apply against the same order a 12-ft. Dreis & Krump bending brake, a large bulldozer, Bradley hammers, Landis bolt and pipe cutters, and a number of machine tools, including a Cleveland open-side planer, lathes, shapers and drill presses. A 1500-ton hydraulic press is yet to be bought as well as additional miscellaneous equipment which, however, has been practically all arranged for.

Among other orders recently reported is one from the Phoenix Horse Shoe Co., Joliet, Ill., for a 24-in. and a 30-in. engine lathe and a 32-in. shaper for its Poughkeepsie, N. Y., plant. The purchase of a boring mill is also contemplated. For the junior high school at South Bend, Ind., mentioned a week ago, the Board of Education is reported to have closed for seven South Bend engine lathes, but still has a number of other machines to buy. The H. W. Johns-Manville Co., Madison Avenue and Forty-first Street, New York, has revived the inquiry for its new Waukegan plant, which was published in this column on July 18. There are 15 items in the list.

The West Side Ice Co., 937 North Hoyne Avenue, Chicago, has let contract for a one-story plant, 49 x 220 ft., to cost \$35,000.

The Anderson Stove Co., recently incorporated, Anderson, Ind., will re-open the Frazer Stove Co. plant in North Anderson about Jan. 10. The entire output, it is stated, has been contracted for by Montgomery-Ward & Co., Chicago. Kitchen ranges of various models will be manufactured. Directors of the company include John S. Keefe, Indianapolis, owner of the plant property, Jacob Keller, Belvidere, Ill., an experienced stove maker, and Joseph McMinn, Louisville, Ky., who has also been identified with the stove industry.

The Cornell Belting Co., Chicago, recently incorporated, has leased a plant at 162 West Austin Avenue, for a period of years. The company will confine itself to the manufacture of leather belting and has bought several leather working machines. The officers are E. H. Cornell, president; H. I. Fritts, vice-president; H. C. Schroeder, treasurer, and E. B. McGrath, secretary.

The Western Fixture Mfg. Corporation, manufacturer of store fixtures, 3039 Elston Avenue, Chicago, is receiving bids on a one-story addition, 80 x 119 ft., to cost \$40,000.

The Dental Metal Products Co., A. D. Gray, manager, 623 South Wabash Avenue, Chicago, is taking bids on a two-story factory and warehouse, 42 x 71 and 28 x 42 ft., respectively, at 7512-7518 Greenwood Avenue, to cost \$30,000.

The Paramount Knitting Co., Henry Polk, president, 337 West Madison Street, Chicago, has had plans prepared by Lookwood, Greene & Co., 38 South Dearborn Street, for a three-story reinforced concrete factory, 50 x 80 ft., at Kankakee, Ill., to cost \$50,000.

The Auto Specialty Mfg. Co., St. Joseph, Mich., has had plans prepared by Davidson & Weiss, 53 West Jackson Boulevard, Chicago, for two one-story foundry additions, 80 x 325 and 80 x 162 ft., respectively, to cost \$100,000. Bids will be taken after the New Year.

B. Wendle, 4629 West Madison Street, Chicago, has let contract for a one-story blacksmith shop, 25 x 102 ft., to cost \$3,000.

The Elgin Watch Co., Charles H. Hubbard, president, 10 South Wabash Avenue, Chicago, has commenced work on

several four and five-story additions to its plant at Elgin, Ill., to cost \$500,000. Plans were completed fully two years ago.

The Bassick Mfg. Co., 361 West Superior Street, Chicago, manufacturer of lubricating devices, grease cups, etc., has preliminary plans for a new two-story and basement factory, 80 x 420 ft., on Addison Street. Stone & Webster, 38 South Dearborn Street, are architects and engineers.

C. A. Starr, 137 Park Place, Decatur, Ill., is planning for a one-story machine repair and automobile service works, 75 x 160 ft., estimated to cost \$42,000.

The Wyman-Gordon Co., 332 South Michigan Avenue, Chicago, manufacturer of forgings, has tentative plans for the construction of a new power plant at its works at Harvey, Ill., estimated to cost about \$100,000. Erection will be held in abeyance for a time.

The Common Council, Muscatine, Iowa, is planning for the construction of a municipal electric light and power plant, estimated to cost about \$250,000.

A vocational department will be installed in the two-story junior high school building, 150 x 150 ft., to be erected by the Board of Education, Minneapolis, Minn., estimated to cost close to \$500,000. E. H. Enger, City Hall, is architect.

The Diamond Calk Horseshoe Co., 4620 Grand Avenue, Duluth, Minn., is planning the erection of a two-story and basement building, 50 x 100 ft., estimated to cost about \$45,000. J. J. Wangenstein, Providence Building, is architect.

J. H. Baker and J. J. Clarke, Redford, Iowa, are organizing a new company to construct an ice manufacturing and cold storage plant estimated to cost about \$200,000, including equipment. Plans will be prepared soon.

A vocational department will be installed in the three-story and basement high school to be erected at Decorah, Iowa, to be 80 x 140 ft., and estimated to cost about \$150,000. Temple & Burrows, 208 Main Street, Davenport, are architects.

Cleveland

CLEVELAND, Dec. 27.

While machine tool business continues dull, there is a better feeling in the trade which expects more activity early next year. The lack of interest on the part of buyers of machinery has to some extent disappeared and a few small inquiries have come from companies which advise that they expect to buy new equipment, but will do nothing definite about purchases before January. Although there is usually a little business during the holiday period, dealers made a number of sales in single machines the past week. Among the inquiries is one from the Herbrand Co., Fremont, which is in the market for milling machines for production work and is expected to purchase several of these machines.

The Williamson Hydraulic Clutch Co., Mt. Vernon, Ohio, recently organized to bring out a new type of clutch, has contracted with the Landis Tool Co., Waukesha, Pa., for the use and manufacture of the clutch on a royalty basis.

The Urbana Tool & Die Co., Urbana, Ohio, has secured a large contract from an automobile company which, it is announced, will necessitate the operation of its plant at full capacity night and day for two or three months.

Cincinnati

CINCINNATI, Dec. 27.

The pre-holiday week, usually the duller, is perhaps the exception this year in that the number of orders booked is on a par with the preceding weeks. The month of December will show a slight falling off, compared with November, but general conditions considered, manufacturers find much to encourage them. Inquiries for tools are coming from all parts of the country, and it is expected that after the first of the year, many will develop into orders. While most orders booked are for single machines, they are not confined to any one section and indicate that the gradual improvement is general. There has been little buying by the railroads and no action has been taken on any of the larger lists before the trade. It is expected that the Delaware, Lackawanna & Western Railroad and the Seaboard Air Line will close for equipment within the next week or two, and some action is also expected to be taken by the Rock Island. Industrial concerns in France are apparently picking up, as some inquiries were received from that country during the week. Export business, as a whole, however, is at a low ebb, and not much is expected from this source until exchange conditions are better.

The Illinois Car Co., Urbana, Ohio, has awarded contract to the Bellefontaine Bridge Co., for an erecting shop, 200 x 300 ft., of concrete, steel and glass. The company contemplates the erection of other buildings, but probably nothing

will be done until after the completion of the erecting shop.

The International Derrick & Equipment Co., Columbus, Ohio, recently acquired the plant of the Columbus Structural Steel Co., which it will rearrange for the fabrication of steel derricks for oil, gas and artesian well industries. It also plans the installation of galvanizing works. The company is capitalized at \$500,000 and is headed by Gordon Battelle and Harry M. Runkle.

The Held Tractor Co., Columbus, Ohio, manufacturer of tractors especially designed for use by truck gardeners, has purchased the building at 609-611 North Fourth Street, Columbus, and will make alterations preparatory to commencing operations on a larger scale. It has been operating in Columbus for over a year and increasing business makes larger quarters necessary.

Pittsburgh

PITTSBURGH, Dec. 26.

Due to the holiday season and inventory period, practically all pending inquiries are being held over until after the first of the new year. Several local dealers have some fair sized orders under negotiation, but do not expect to do anything definite until early next month. Railroads are buying very little and no important inquiries are out. Some time ago the Union Railroad of the Carnegie Steel Co., came into the market for a number of tools and later made some purchases, but it is still in the market for a heavy shaper, a heavy shear for cutting large channels and a radial drill. Orders for these tools are expected to be placed soon.

A local machinery house has definite inquiries for two monorail equipments for handling coal. These are nearly closed but the prospective buyers will not definitely place the contracts until next month. The local office of Manning, Maxwell & Moore has sold to the Sharpsburg Foundry Co., Sharpsburg, Pa., one 5-ton and one 10-ton Shaw electric crane, each 45-ft. span.

The Wheeling Steel Corporation has inquiries out for some heavy steel works equipment for its LaBelle Iron Works, Steubenville, Ohio. If this contract is placed the company will probably purchase a number of tools for the machine shops at the LaBelle works, or for a new machine shop that may be built.

The machinery market outlook for first quarter is regarded as fair, but it is not believed that any considerable amount of buying will set in until the second quarter. Prices of finished steel products are tending downward, and it will likely take all of the first quarter to stabilize the market. The railroads are not figuring in the market very largely.

The Elliott Co., Jannette, Pa., has not yet closed on its inquiry for a 50-ton crane.

The Traver Engineering Co., Beaver Falls, Pa., has plans under way for the erection of a new one-story factory, 70 x 88 ft. Work will be commenced at an early date.

Fire, Dec. 21, destroyed the repair and service buildings of the Patton Automobile Co., Patton, near Johnstown, Pa., with loss estimated at close to \$40,000, exclusive of automobiles.

The Hecla Park Association, Bellefonte, Pa., is planning the construction of a new one-story electric light and power plant, estimated to cost about \$50,000. W. C. Rowe, Allegheny Street, is engineer.

The J. K. Davidson & Brother Sand Co., Pittsburgh, has awarded contract to the American Bridge Co., Ambridge, Pa., for the construction of twelve steel barges.

The Borough Council, Woodlawn, Pa., has preliminary plans under way for a two-story forge and blacksmith shop for municipal service, to be 50 x 75 ft. Carlisle & Sharer, 7119 Jenkins Arcade Building, Pittsburgh, are architects.

The Philadelphia Co., Pittsburgh, operating the Pittsburgh Railways, has tentative plans under way for extensions and improvements in car shops and car barns, additional track and line construction, power betterments, and for the purchase of about 200 new cars. Arrangements are being made to secure a fund of \$5,000,000, to be used in part for the work.

The Wharton Motors Co., Johnstown, Pa., is planning for the erection of a three-story factory to manufacture automobile equipment, estimated to cost about \$100,000. W. H. Lamborne is manager.

The United States Arsenal, Pittsburgh, Maj. Francis F. Jewett, commandant, is considering the establishment of an aviation station. Negotiations are under way with the Chamber of Commerce and the city regarding the land. The station will include a complete repair shop for general work and parts manufacture, hangars, etc., and will be under the direction of the United States Aero Service.

Struble & Riley, Turtle Creek, Pa., are having plans prepared for a two-story automobile service and repair building,

75 x 175 ft., estimated to cost about \$150,000, including equipment. S. C. Richards & Co., 430 Library Street, Brad-dock, Pa., are architects.

A vocational department will be installed in the two-story high school to be erected by the Board of Education, Terra Alta, W. Va., estimated to cost about \$125,000. Richard M. Bates, First National Bank Building, Huntington, W. Va., is architect.

The Babcock Coal & Coke Co., Fayetteville, W. Va., will install electric motors and other equipment at its No. 7 mine, Nuttall district, Cliff Top.

The Simons-Woodward Auto Co., Spencer, W. Va., is having plans prepared for a two-story and basement automobile service and repair building, 50 x 130 ft. Richard M. Bates, First National Bank Building, Huntington, W. Va., is architect.

A vocational department will be installed in the two-story and basement high school to be constructed at Sand Fork, W. Va., by the Board of Education of the Glenville District. J. A. Radcliffe, president, Linn, W. Va. It is estimated to cost in excess of \$75,000.

The Board of Education, Wayne, W. Va., will install a vocational department in its new high school, estimated to cost about \$250,000, plans for which will be prepared by Holmboe & Pogue, Clarksburg, W. Va., architects.

The Gulf States

BIRMINGHAM, Dec. 26.

The Greenwood Compress & Storage Co., Greenwood, Miss., is considering tentative plans for the rebuilding of its plant, recently destroyed by fire with loss reported in excess of \$500,000, including machinery, stock, etc. J. T. Allen & Co., Jackson, Miss., operate the property.

The Mo-Jo Filter Co., Rockdale, Tex., recently organized to manufacture filters and filtering equipment, has closed an agreement with the Chamber of Commerce for a site for its proposed plant. It will install equipment and begin operations at the earliest possible date. R. S. Moore is head.

The Nacogdoches Iron Works, Nacogdoches, Tex., recently organized, is arranging for the immediate establishment of a local plant and proposes to begin operations early in February. It is headed by A. W. Simmons, Athens, Tex., and H. D. Minick, Jacksonville, Tex.

The Hastings Machine Co., Hastings, Fla., recently organized as a subsidiary of the Big Brick Garage Co., is planning to establish a general machine and repair plant, with department to manufacture farming implements and other products.

The Edna Light, Ice & Water Co., Edna, Tex., is planning the installation of new electrical equipment at its power plant. It is also proposed to increase the capacity of the ice-manufacturing plant with additional machinery.

The Wortham Refining Co., Wortham, Tex., recently organized, has acquired property in the northern section of the city for a new oil refinery. Ground will be broken soon for the first unit, to have a capacity of about 400 bbl. per day. H. G. Lemendes is president, and Roger Seeley, secretary and treasurer.

The Alexandria Refining Co., Alexandria, La., has acquired a site at South Alexandria for its proposed new oil refinery and will proceed with erection at once. E. M. Talley is manager.

A vocational department will be installed in the new high school to be erected at Amarillo, Tex., estimated to cost about \$400,000. Parker & Rittenberry, Amarillo, are architects.

The Stacey Co., Dallas, Tex., manufacturer of cotton-cleaning machinery, is negotiating for a site for a new factory. It recently increased its capital to \$50,000 for expansion.

The Board of City Commissioners, Terrell, Tex., has perfected plans for the installation of new engines and other equipment at the municipal electric power plant.

The Southern Utilities Co., Palatka, Fla., will make extensions and improvements in its electric power plant at Tarpon Springs, Fla., to cost about \$25,000, exclusive of machinery. It is proposed to double the capacity. George A. Loudon is general manager.

The Magnolia Petroleum Co., Dallas, Tex., will build a tank farm at Mexia, Tex., to comprise ultimately 135 steel tanks, with aggregate capacity of 7,000,000 bbl. of oil. An initial unit of 18 steel tanks is now in course of construction.

The Amarillo Iron Foundry & Planing Mill, Amarillo, Tex., is considering rebuilding the portion of its plant recently destroyed by fire with loss of about \$25,000.

The Standard Gas & Electric Co., 208 South La Salle Street, Chicago, is considering the construction of an electric power plant in the vicinity of Mobile, Ala., estimated to cost in excess of \$400,000.

The De Land Electric Light, Power & Ice Co., De Land, Fla., has completed plans for extensions and improvements in its electric power plant to cost about \$75,000, and will commence work at once.

Milwaukee

MILWAUKEE, Dec. 26.

As usual, the machine tool trade the past week was very quiet, and no increase in activity is looked for this week, due to the general suspension of shop operations between holidays and taking of inventories. There has been a little inquiry which is expected to broaden, although the trade looks for no large materialization of purchases before Jan. 1. Prospects for 1922 are regarded as better than those of a year ago, as there has been a definite upturn in the metal-working industries which is being interrupted only by the holiday season.

The Forster Foundry Co., Menomonie, Wis., has been incorporated with a capital stock of \$10,000 by H. L. Forster, S. A. Forster and G. A. Forster, all of Menomonie, and will leave an idle foundry building and engage in the production of gray iron, brass, bronze and aluminum castings.

The High Speed Steel & Tool Co., Green Bay, Wis., has been granted a charter to manufacture specialties, principally tool steel, tools for high-speed metal-working machines, etc. For the present it will not establish a plant, but this is in prospect. The principals are John T. Phillips, president Diamond Lumber Co., S. W. Mahaffey and F. T. Phillips, all of Green Bay.

Fairbanks, Morse & Co., Chicago, which recently completed a new gray iron foundry at its Eclipse works in Beloit, Wis., at a cost of nearly \$1,500,000, on Jan. 1 will transfer its marine engine works from Three Rivers, Mich., to Beloit to take advantage of the enlarged casting and machining facilities. The Eclipse works heretofore specialized in farm gas engines and other power units, pumps, etc., principally for agricultural purposes. George H. Ingersoll is general manager at Beloit.

The Manitowoc Church Furniture Co., Waukesha, Wis., which recently accepted plans for a steam generating plant addition, has deferred construction until spring and will not be in the market for new equipment before March 15 or April 1. Charles F. Schuetz is general manager.

The Cudahy Brothers Co., meat packer, Cudahy, Wis., awarded the general contract to the American Contracting Co., 198 Milwaukee Street, Milwaukee, for a one-story brick and concrete box and crating factory, 80 x 190 ft., to replace a shop recently destroyed by fire. New equipment will be required throughout. Edward F. Lawlor is general manager.

The Board of Education, Iola, Wis., has plans by Edward Tough, architect, Madison, Wis., for a two-story addition to the high school, for vocational training. The present building also will be remodeled. The work will cost about \$85,000. E. C. Wipf is secretary.

The Manitowoc-Bulck Co., Manitowoc, Wis., owned by Hamacheck & Bleser, will build a new garage to cost \$50,000 complete. It will be 50 x 168 ft., part two stories and basement, with a machine shop and service department, 50 x 75 ft. The architects are Smith & Reynolds, local.

The Sparta, Wis., Board of Education has engaged Parkinson & Dockendorff, architects, La Crosse, Wis., to design a new high school and vocational training institute, for which purpose an appropriation of \$200,000 is available. Dr. S. D. Beebe is president of the board.

The Pabst Corporation, 917 Chestnut Street, Milwaukee, formerly the Pabst Brewing Co., has reorganized its official personnel, with Frederick Pabst as president, to succeed Col. Gustave Pabst; Harry W. Marsh, formerly secretary, as vice-president and general manager; Hugo Kuechenmeister, treasurer, and Edward F. Loebel, secretary. Besides continuing the manufacture of malt syrups, cereals, etc., the new administration has plans for converting some of the unused capacity into metal-working industries, the first to be a machine shop for producing a patented design of valve rotator for internal combustion poppet-valve engines. A small experimental shop has been operated on this design for about 18 months. Details of other plans are withheld for the present.

The E. I. M. Tire & Rubber Co., Racine, Wis., is taking bids until Jan. 7 for a two-story brick and concrete addition, 80 x 144 ft., at Deane Boulevard and the Milwaukee road tracks. With equipment, the improvement will cost about \$65,000. O. W. Dunham is secretary.

The Phono-Lamp Mfg. Co., Beloit, Wis., has been incorporated with a capital stock of \$300,000 by interests identified with the American National Mfg. Co., St. Louis, manufacturer of combination talking machines and lighting fixtures, which recently acquired the brass foundry and machine shop of Slater & Tuck at Beloit. The incorporators are M. W. Wiegand, C. A. Riemer and E. R. Lucas.

Baltimore

BALTIMORE, Dec. 27.

The Union Shipbuilding Co., Fairfield, Baltimore, has revised plans under way for a two-story building, 70 x 200 ft., bids for which will be asked in about 60 days. F. C. Stauffen is manager.

Machinery to cost in excess of \$100,000 will be installed in the three-story coopeage plant to be erected by the Brooklyn Coopeage Co., 142 Kent Avenue, Brooklyn, N. Y., in the Locust Point section, Baltimore, adjoining the plant of the American Sugar Refining Co., now in course of construction.

The Fort Avenue Garage, 725 Fort Avenue, Baltimore, will build a one-story repair and service works addition, 70 x 135 ft. Plans have been drawn.

The Smokeless Coal Corporation, Pulaski, Va., recently organized, is planning for the installation of electrical and other equipment at its properties. G. H. Snider is manager.

The Hagerstown & Frederick Electric Railway Co., Hagerstown, Md., is planning to double the capacity of its power house on Grant Street, Frostburg, Md. Power will be furnished to the Consolidation Coal Co. mines, as well as the mining properties of the Piedmont & Georges Creek Coal Co., both of which will install electrical equipment, motors, etc., for operation.

The City Council, Hagerstown, Md., will call for bids early in the spring for its proposed municipal electric power plant, preliminary plans for which are under way. It will cost about \$300,000. C. E. Davis is clerk; A. B. Grubmeyer, 21 East Franklin Street, is engineer.

Fire, Dec. 13, destroyed four hangars, repair shop, tools, etc., at the aviation property of the War Department, Washington, at Langley Field, Newport News, Va., with loss estimated at about \$200,000.

The Economy Tractor Co., Greenville, S. C., recently organized with a capital of \$100,000 to manufacture motor-driven tractors and parts, has leased a building for a temporary plant. A new factory will be erected later. W. C. Cleveland is president, and J. P. Hughes, manager.

The Southern Power Co., Charlotte, N. C., is perfecting plans for the immediate construction of its new hydroelectric power plants at Mountain Island, N. C., and at Great Falls, S. C., both on the Catawba River. The first noted will have a capacity of 80,000 hp., and the other, 60,000 hp. Contracts for the buildings have been awarded to the Rhinehart & Dennis Co., Charlottesville, Va., and to Scott, Stewart, Jones & Co., Greenville, S. C. The plants are estimated to cost in excess of \$5,000,000.

A vocational department will be installed in the two-story and basement high school to be erected at West Hickory, N. C., estimated to cost about \$80,000. Benton & Benton, Wilson, N. C., are architects.

P. L. McCull, Cedartown, Ga., is organizing a company to establish a plant to manufacture cones, tubes and similar mechanical equipment for textile mills. A site will be selected at an early date.

William J. Eisenhardt, 108 West Lombard Street, Baltimore, operating a plant for the manufacture of plated metal products, has awarded contract to E. Eyring & Sons, 3501 Faith Avenue, for an addition, 26 x 120 ft., for general manufacture, estimated to cost about \$25,000.

Fire, Dec. 18, destroyed the building of the Paul E. Blanford Co., Norfolk, Va., marine equipment, etc., with loss estimated at about \$150,000.

The Williamson Mfg. Co., Homeland Avenue and York Road, Baltimore, manufacturer of automobile equipment, is planning for enlargements and the installation of new equipment. Plans are also under consideration for the establishment of new works in another location. John S. Williamson is president.

The Wilmington Sugar Refinery Co., Wilmington, Del., will soon break ground for the first eight buildings, to form its local plant, estimated to cost in excess of \$2,500,000, including machinery, mechanical conveyors, machine repair works, etc.

F. B. Hatch, Albany, Ga., is organizing a company to construct a hydroelectric power plant at Banks Mill Pond.

The Triangle Motor Co., 3 New York Avenue, N. E., Washington, has completed plans and will commence the immediate erection of a two-story repair and service building, 66 x 100 ft., at 19 New York Avenue, N. E., estimated to cost about \$35,000.

The Georgia Fullers Earth Co., Lumpkin, Ga., is planning for the installation of a mechanical conveying system at its property. Other field and operating machinery will also be installed. D. W. Bailey is head.

A vocational department will be installed in the new

high school to be erected by the Board of Education, Raleigh, N. C., estimated to cost about \$500,000, bonds for which are now being arranged. C. Gadsden Sayre, Raleigh, is architect.

The W. H. Winborne Co., Conway, S. C., is planning the erection of a two-story plant, 80 x 105 ft., to manufacture ceilings, moldings, etc. Work will commence at an early date. W. H. Winborne is president.

The Board of Commissioners, Pilot Mountain, N. C., has approved a bond issue of \$40,000 for the construction of a municipal electric light and power plant. P. E. Simmons is secretary.

Indiana

INDIANAPOLIS, Dec. 27.

The Wayne Oil & Tank Co., 58 West New York Avenue, Indianapolis, is considering the erection of an addition to cost about \$150,000, including machinery.

The Board of Education, Fort Wayne, Ind., has had plans prepared for a two-story and basement vocational shop at the central high school, estimated to cost about \$200,000. A portion of the structure will be reserved for a gymnasium. Bids will be asked in the spring. Charles R. Weatherhogg, 405 Citizens' Trust Building, is architect. Byron Summers is president of the board.

The Lock Joint Tube Co., Mishawaka, Ind., manufacturer of metal tubing and other products, has plans under way for a new one-story factory, 45 x 90 ft., estimated to cost about \$30,000.

The Kemp Machine Works, Muncie, Ind., will devote production in the future to pistons, piston rings, tools and kindred specialties, changing over from engine manufacture for marine and aeroplane service, as heretofore conducted.

The Common Council, Linton, Ind., has preliminary plans in preparation for a municipal electric light and power plant. The Shrouds-Stoner Co., Tribune Building, Terre Haute, Ind., is architect.

The American Coating Mills, Elkhart, Ind., manufacturer of coated paper products, will erect a five-story building, 100 x 125 ft., estimated to cost about \$250,000.

The Model Machine Works, Frankfort, Ind., heretofore operated by Perry Goble, has been acquired by J. M. Neher, who will take immediate possession. Operations will be continued as heretofore.

The Central South

ST. LOUIS, Dec. 26.

The E. K. Campbell Heating Co., Kansas City, Mo., manufacturer of heating equipment, furnaces, etc., is planning the erection of a new one-story factory, 75 x 130 ft. Carl Bolh & Brother, Kansas City, are architects.

Fire, Dec. 15, destroyed the plant of the Pine Bluff Spoke Co., Pine Bluff, Ark., with loss estimated at about \$50,000, including machinery. It is planned to rebuild.

The City Council, Woodward, Okla., is perfecting plans for a municipal electric light and power plant, estimated to cost about \$100,000. Bonds will be provided.

The Caddo River Power & Irrigation Co., Little Rock, Ark., recently organized with a capital of \$1,000,000, has been granted permission to construct a hydroelectric power plant near Arkadelphia, on the Caddo River, estimated to cost close to \$800,000. H. L. Rammel is president, and H. C. Couch, secretary.

A. Y. Burrows, Knoxville, Tenn., and Jefferson Kinsel, Clearfield, Tenn., are organizing a company with capital of \$500,000 to build a plant in the vicinity of Knoxville, to manufacture torpedoes, etc., for aerial service.

A vocational department will be installed in the junior high school to be erected at Cherryvale, Kan., estimated to cost about \$100,000. J. H. Folt & Co., 800 Grand Avenue, Kansas City, Mo., are architects.

The Thomas Fruit Co., Joplin, Mo., has acquired an existing building and will remodel the structure for a new cold storage plant, estimated to cost about \$75,000, including equipment. Charles A. Moore, 646 Plymouth Building, Minneapolis, Minn., is engineer. Abner Thomas is president.

The Russellville Compress Co., Russellville, Ark., recently organized, has taken title to about 12 acres of land as a site for new works, estimated to cost approximately \$50,000, including equipment. Plans are being prepared. A. N. Falls is secretary.

The Seymour Packing Co., Topeka, Kan., has awarded a contract to F. M. Spencer & Son, Mulvane Building, for the erection of a three-story addition, 50 x 150 ft., to be equipped as a cold storage plant, estimated to cost close to \$100,000. The Tait-Nordmeyer Engineering Co., St. Louis, is engineer.

A one-story power house will be erected at the plant of the United Casket Co., 3022 West Chestnut Street, Louis-

vile, in connection with the construction of an extension, 100 x 450 ft.

The Jenner-Woody Motor Co., Louisville, has tentative plans for new works at Twelfth Street and Broadway, estimated to cost about \$100,000. John W. Jenner is president and general manager. Lealie V. Abbott, Thierman Apartments, is architect.

The Common Council, Columbia, Mo., will commence the immediate construction of a new municipal electric light and power plant, estimated to cost about \$100,000. Plans have been completed.

The Osage Power Co., Lamar, Mo., is perfecting plans for its proposed hydroelectric generating plant on the Osage River, near Bagnell, Mo., with initial capacity of 40,000-hp. R. Williams, company address, is consulting engineer.

A vocational department will be installed in the two-story and basement high school to be erected at Howling Green, Ky., estimated to cost about \$100,000. Bids will be asked early in 1922. L. D. Hanes is president of the board.

The Joseph Forshaw Stove & Heating Co., 111 North Twelfth Street, St. Louis, is clearing the site for a new seven-story and basement building, 50 x 100 ft., contract for which has been awarded to the James Godfrey Co., Wainwright Building. It is estimated to cost about \$75,000.

The Board of Education, Wichita, Kan., is arranging for a bond issue of \$1,000,000 for the erection of a new high school, including vocational department. Lorentz, Schmidt & Co., 121 North Market Street, are architects.

Detroit

DETROIT, Dec. 27.

The Michigan Chandelier Co., 1745 Brush Street, Detroit, manufacturer of brass and other lighting fixtures, has tentative plans under way for the erection of a three-story factory on Chene Street, 20 x 110 ft., estimated to cost \$75,000, including equipment. The Building Service Bureau, 1336 Brush Street, is architect.

Fire, Dec. 23, destroyed the power plant of the Consumers' Power Co., near Big Rapids, Mich., with loss estimated at \$350,000, including equipment. It is planned to rebuild. Offices of the company are at Grand Rapids, Mich.

The Dry-Kold Refrigerator Co., Niles, Mich., manufacturer of electrically operated refrigerators, has construction under way on an addition to its plant.

The Crodius Steam Pressed Brick Co., Pontiac, Mich., has tentative plans for the erection of a new factory on Sanderson Street. It is proposed to call for bids in the spring. C. J. Crawford is president.

The West Michigan Steel Foundry Co., Muskegon, Mich., is considering rebuilding its plant, almost completely destroyed by fire, Dec. 14, with loss reported at \$150,000.

A one-story power house, 38 x 60 ft., will be constructed at the plant of the Belle Isle & East Side Creamery Co., Detroit. Williams Brothers, 1111 Kresge Building, architects, have completed plans.

The Union Bag & Paper Co., Sheboygan, Mich., will make extensions and improvements in its plant, including the remodeling of the present mill, 60 x 100 ft., estimated to cost about \$100,000. G. S. Witham is general superintendent.

Daniel J. Ryan, formerly sales manager of the Detroit Nickel Plating & Mfg. Co., Detroit, has organized the General Electro-Plating & Mfg. Co., 465 York Street, with a capital stock of \$10,000, to do a general jobbing business and to manufacture brass, bronze and aluminum castings. The officers are Daniel J. Ryan, president and sales manager; James Kane, vice-president, and William Wallace, formerly connected with the Studebaker Corporation, secretary-treasurer. The company is in the market for foundry equipment and polishing lathes.

Dividend disbursement by industrial, commercial and banking interests at Youngstown, Ohio, largely representing fourth quarter payments, will approximate \$1,500,000. In most cases the dividends are payable Jan. 2. In disbursing \$575,000 on its common and preferred stocks, the Youngstown Sheet & Tube Co. will lead in the distribution, followed by the Trumbull Steel Co., which will pay a total of about \$285,000 on both issues. The Sheet & Tube Company common payment is at the rate of 50c. per share, while the Trumbull Company will disburse 15c. per share on common. The Standard Textile Products Co. will pay \$140,000 in dividends. Other dividend distributors at Youngstown will be the Brier Hill Steel Co., Newton Steel Co., Falcon Steel Co. and General Fireproofing Co.

The assets of the Federal Corporation, Westfield, Mass., have been sold by the trustee of the property to Richard J. Burton, Brookline, Mass. The real estate is not involved in the deal, since the property was taken over by the First National Bank, Boston, to satisfy its mortgage. The company manufactured spark plugs, rim tools, lamps, electric sockets and other accessories.

IRON AND INDUSTRIAL STOCKS

Values in General Have Shrunk During the Past Week or Ten Days

Values of securities in general have shrunk since last reports. The aggressive buying power which raised prices so substantially through November and early December is not in evidence. On the other hand, the pressure to sell stocks and bonds is not severe, and for the moment can be traced to higher money rates. People who heretofore borrowed money to buy securities are the chief sellers of securities to-day. There is comparatively little liquidating by real investors, because it is felt the high money rates are temporary and that following the seasonable lull in commercial buying will come a gradual improvement in business. Security investors, as a rule, do not look for a business boom, however, but rather the long pull to prosperity. The liquidation of frozen credits is progressing favorably and should end within the next few months. Prices for staple commodities in a great many instances have been thoroughly liquidated. It only remains for a buying power to develop, and a buying power in a country with as much money as is contained in the United States cannot lie dormant indefinitely. Which explains why the real investor is not anxious to sell stocks and bonds. There are, of course, people who recently have sold stocks because they were uneasy over developments in certain industries, but this does not apply to iron and steel stocks. It is true that holders of some iron and steel stocks are uneasy due to curtailed plant operations with resultant negative earnings, but these conditions in a very large measure are offset by consolidations of properties possibilities, attractive from the economic as well as the conversion viewpoint.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Allis-Chalm. com. 37½-39½	Lackawanna Steel. 43½-46½
Allis-Chalm. pf. 87½-89	Midvale Steel. 26-28½

Purchase of Haskell & Barker Car Co. Approved

At a special meeting at Chicago on Dec. 20, stockholders of the Pullman Co. voted to approve the purchase of the property and assets of the Haskell & Barker Car Co. and to increase the capital stock of the Pullman Co. from \$120,000,000, consisting of 1,200,000 shares at \$100 par to \$135,000,000 consisting of 1,350,000 shares at \$100 par each. Terms upon which the Pullman Co. will take over the Haskell & Barker interests are as follows: The Pullman Co. is to assume all debts and obligations of the Haskell & Barker Car Co. It will then issue to the directors of the other concern, 165,000 shares of Pullman stock. The Haskell & Barker Car Co. will have the right to declare and pay the stockholders out of its assets, before the purchase by the Pullman Co., an extra dividend of \$1.25 per share upon present outstanding capital stock, amounting to \$275,000. The stockholders of the Pullman Co. consent that the 150,000 shares of new stock of that company authorized by amendment to the charter, may be issued and delivered to directors of the Haskell & Barker Car Co., as part of the 165,000 shares called for by the terms of the purchase. Three new directors of the Pullman Co. were elected by the Pullman Co. stockholders: Edward F. Carr, president Haskell & Barker Car Co., Inc.; John R. Morrow and Arthur O. Choate, both of New York.

The report that the Lima Locomotive Co., Lima, Ohio, will be added to the consolidated car company, has not been confirmed up to date.

The Elwood Foundry Co., Elwood, Ind., has been declared a voluntary bankrupt in the federal court at Indianapolis. Liabilities amount to about \$12,000 and the assets, including real estate, to a trifle more than that sum.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The quotations given below are for small lots, as sold from stores in New York City by merchants carrying stocks.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

---	--------------

Old Metals

Prices are firm but business is quiet. Dealers' buying prices are nominally as follows:

	Cents Per Lb.
Copper, heavy crucible.....	11.25
Copper, heavy wire	10.75
Copper, light and bottoms	8.25
Brass, heavy	5.50
Brass, light	4.50
Heavy machine composition.....	8.00
No. 1 yellow brass turnings	5.50
No. 1 red brass or composition turnings.....	7.00
Lead, heavy	3.75
Lead, tea	2.50
Zinc.....	2.50

THE IRON AGE

New York, January 5, 1922

ESTABLISHED 1855

VOL. 109, No. 1

Lowest Output in Relation to Capacity

Nineteen-Twenty-One a 38 Per Cent Year in Steel—Steadily Declining Prices, But High Costs Due Largely to High Freights and Restricted Operations

THE iron and steel industry entered 1921 well persuaded that the depression that came upon it three months before the end of 1920 would grow more acute in the new year. Yet it is truth to say that no prophecy made at the beginning of 1921 went so deep into depression as both prices and production went, as the result of the year's developments.

Prices declined steadily throughout the year, with an occasional eddy unrelated to the general trend, and the plotted curves for rolled steel are all at high point in January and at low point in December. The production curve is different. Its high point is in January, but its low point is in July, while December is about half way between the two.

Hopes of Rebound Dashed

Just as in the second half of 1919 and the greater part of 1920 most manufacturers believed that the war reckoning had been dodged, because it did not come as soon as they expected, so in the early months of the present depression there was a belief that the demand for iron and steel dropped off so precipitously in the fall of 1920 that some rebound was inevitable. The spring of 1921 was the time generally set for renewed buying, and the theory was that as restriction in output, particularly in pig iron, had been drastic, there might be some stiffening in prices along with the revival in demand. All such hopes were disappointed.

At the beginning of April it was said in THE IRON AGE's market summary: "Production [of

pig iron] to-day is the smallest on record in proportion to the country's capacity." The same statement could have been made in succession at the beginning of May, June, July and August. But in August the turn came and for four months there was a succession of increases in output. Steel ingot production likewise was at low point in July.

1921 in Iron and Steel

A YEAR of severe depression, of steadily declining prices, of unemployment and successive wage reductions for workmen, and of heavy losses for iron and steel companies.

Output was on a smaller scale, in relation to capacity, than in any other year in the history of the industry.

Pig iron production was about 16,400,000 tons, 44 per cent of the 36,925,000 tons of 1920. We must go back 13 years, or to the 15,936,000 tons of 1908 (the year after the last panic), to find so small a pig iron year.

Steel works produced about 19,250,000 tons of ingots, against 40,881,000 tons in 1920. In terms of the country's ingot capacity, 1921 will rate as a 38 per cent year.

The decline in prices was from an average of 3.082c. per lb. on Jan. 1, for the seven leading forms of finished steel, to 2.062c. per lb. on Dec. 31. At the beginning of the year the average of these seven products stood at 85 per cent, and at the close of the year at only 24 per cent, above the 1913 average.

Using Up Stocks to the Utmost

The one thing in the record of 1921 as a steel year that stands out above all else, and that was continually a marvel, was the way in which consumers got along without going to the mills. There was much more steel in the country, in the hands of jobbers, manufacturing consumers and others than had been thought. The country never got along before on a 38 per cent operation of its steel capacity and it would not have done so last year but for using up to the last ton what was carried over from 1920. Thus the effort of consumers in all lines to reduce their steel inventory to the lowest point dominated mill operations. As prices steadily declined resort was had to every expedient to avoid drawing on the mills for fresh supplies. Railroads

shipped steel across the country from one repair shop that had fair stocks to another that had little. Jobbers in iron and steel traded with competing jobbers, shipping sizes and forms in which they were overstocked in exchange for sizes and forms of which they had little. Steel companies at times shipped from their warehouses at mill

prices rather than start up a mill for a meager rolling on which delivery was due.

Blast furnace yards were full of ore bought at the high prices of 1920. Throughout the year such stocks were a heavier and heavier incubus on the ore and pig iron markets. As illustrating the inclination of the whole trade, particularly in the early months of the year, to take the most hopeful view possible of the future, the estimate was common at the end of March, and it appears in our market summary of March 31, that "less than 40,000,000 tons of Lake Superior ore will be shipped this season," seeing that fully 31,000,000 tons was then in furnace yards and on docks. "Less than 40,000,000 tons" was quite correct! But there was no idea on March 31 that the season's movement down the lakes would turn out to be so little as 22,300,000 tons.

Consumers Turn Jobbers

An unprecedented thing was added to all the other influences at work to restrict demand for steel. Along in the second quarter of the year large manufacturing consumers turned jobbers, selling off bars, plates, structural shapes, or whatever they had on hand, at less than warehouse prices. Many of the Steel Corporation's contracts of 1920, taken at much below prevailing prices, were written down as firm orders and the buyers took the deliveries when due. In some cases they could not use the steel, but generally the reselling was prompted by the belief that it could be replaced later at lower prices.

Steel Corporation and "Independent" Prices

The low prices maintained by the Steel Corporation in 1919 and 1920, ranging from \$10 to \$30 per ton below those of independent steel companies in different products, extended their influence into 1921—but not for long. The year opened with the Steel Corporation operating at 85 to 90 per cent of capacity. Independent companies, which for many months in 1920 had sought prompt rather than contract business, had little work ahead and early in January ran at less than half the Steel Corporation's rate. Later in that month independent mills operated at but 20 to 30 per cent of capacity. Some followed the plan of shutting down certain mills altogether, then after two weeks or so starting up to take care of orders that had come in.

The difference in the position of the Steel Corporation and the independents early in the year will appear from the fact that in December, 1920, the latter curtailed pig iron production by blowing out 19 furnaces, whereas the Steel Corporation had three more furnaces at work on Jan. 1 than on Dec. 1. In January the independents blew out nine more furnaces while the corporation blew in one. In February, however, the Steel Corporation was made to feel the effects of the universal contraction, its list of active blast furnaces suffering a net loss of 15 in the month.

At the beginning of the year the Steel Corporation was still adhering to the so-called Industrial Board prices of March 21, 1919. But only a few weeks had passed before the independents went lower. In the first week of February the Midvale Steel & Ordnance Co. announced that it would quote prices low enough to bring business to its mills, some of which had been shut down since early December. Cuts of \$5 per ton below the Steel Corporation schedules came promptly, the products chiefly affected being plates, shapes and bars. The decline went on for several weeks, the Steel Corporation meanwhile maintaining the prices to which it had adhered for about two years.

By April 1 plates had declined from 2.65c. on Jan. 1 to 2c., beams from 2.45c. to 2c. and bars from 2.35c. to 2c. On April 12 the Steel Corporation announced that

it had decided to make substantial reductions, putting bars at 2.10c. and plates and shapes at 2.20c. Billets were reduced from \$38.50 to \$37, wire rods from \$52 to \$48 and tin plates from \$7 to \$6.25 per box. At the same time independent companies, which had been selling below these prices, advanced their quotations to those announced by the Steel Corporation. It was apparent in May that these prices were not holding, some plate mills having made a 2c. price, while bars were sold at 1.90c. Pittsburgh. These price cuts did not increase the volume of business, there being no evidence of a stabilizing influence.

On July 5 the Bethlehem Steel Co. announced reductions amounting to \$4 per ton for bars, plates, shapes, billets, skelp, sheet bars and blue annealed sheets, \$5 for black and galvanized sheets, and \$10 for tin plate. On some products this announcement merely recorded what the market already had done. In mid-July aggressive competition between the Steel Corporation and independent steel producers developed in the Chicago market, Pittsburgh basing having gone by the board in that district.

Through the remainder of the year prices kept on declining. One small counter current was started by an advance of \$2 to \$3 per ton in wire products, made by the Steel Corporation, effective Sept. 10. The real effect of this advance was to bring a large amount of business on its books at prices previously prevailing, which were \$2.75 per keg for wire nails and \$2.50 per 100 lb. for plain wire. While considerable business was done later at the advanced prices of \$2.90 for nails and \$2.60 for plain wire, it turned out that these prices were not really enforced. Later in the year there was considerable cutting in wire products and on Dec. 21 the Steel Corporation announced formal reductions to \$2.50 for wire nails and \$2.25 for plain wire.

There was a jog in the pig iron price line, most noticeable in the Eastern market. Low point was reached in all pig iron markets in August, and in some a slight turn upward came in September, lasting through October. In November prices began falling away again and the decline continued through the year.

Uneconomical Operation

Throughout the year steel companies were constantly at work to get costs down. Naturally wages were reduced, as will be referred to later. But economies in operation were enforced, such as were not possible in the strain for output which marked most of the months of 1920. Crews were recast, and in some instances mill foremen were given such general orders as, Use five men to do the work formerly done by six. Fuel economy was studied anew, in view of the war wages paid at coal mines and the high freight on coal. New economies were found in the use of refractories, lubricants and all other supplies, on which costs had run up beyond all precedent. Per capita output was increased in some classes of operations. At blast furnaces accumulated flue-dust piles were made available by sintering, replacing in some cases considerable percentages of high priced ore in blast furnace mixtures.

But every effort at economy, even that secured by the easiest and least desirable route of wage cuts, met eventual defeat at the hands of High Unit Overhead. All that steel producers had learned of the incomparable value of large tonnages as a divisor into fixed charges had to be forgotten. Small runs, spasmodic starting and stopping of mills, and at all times fractional operation of producing capacity were insuperably baffling. Cases are known in which, rather than start up a mill to make a scheduled delivery, the producer bought the material from a competing company. The latter got the benefit of a longer run, which helped

its cost, while steel company No. 1 was able to buy at less than it would have cost it to start its mill.

Sources of Demand

The railroads are credited with consuming each year a large percentage of the country's steel output. They did not consume much last year, as is told below, but it is to be said in passing that the railroad consumption of steel is always exaggerated in the general thinking. It is doubtful if it has gone above 25 per cent in any year in the past 20, apart, possibly, from 1906 and 1907, and commonly it is not above 20 per cent.

Throughout the year it was the constant comment in market reports that in the heavy products—rails, plates, shapes and bars—demand was indifferent. The lighter products did better—wire, sheets and tin plates. On the whole, there was a good business, particularly in the second half, in wrought pipe. The new oil fields of Texas and the revival in the petroleum market after a period of flatness brought out some good contracts for line pipe.

What saved the day for plate mills, in the small demand from shipyards and car works, was the unusual amount of tank work called for by the oil fields, particularly the Mexia field of Texas. In the second half of the year tank works in the West and Middle West were unusually busy on this account.

New construction, commonly called an index of activity in steel, was held back by excessive labor cost. There was a good deal more house building throughout the country than was commonly credited. This is established by the fact that foundries making heating furnace castings ran at a much better rate than others and that radiator companies really had a good year. Manufacturers of sanitary equipment and builders' hardware fared well also. A good deal was done in the erection of school houses and other public buildings, but not much in business structures, and very little in bridges. The bookings of the fabricating companies averaged for the year about one-third of their capacity.

Agricultural implement warehouses were pretty well stocked with machinery throughout the year, and manufacturers in these lines did little. No large buying of steel from that quarter is to be looked for until the farmer gets on his feet, and that will not be until after the next harvest. The automobile demand was about what was expected of it—considerably less than half that of 1920.

Replenishment demand, after months in which the country had been swept bare of steel in all forms, caused the larger operation of steel works and rolling mills that dates from the early fall of last year.

Meager Demand from Railroads

Railroad buying in 1921 was most disappointing. From early in the year until its end steel producers held to two main hopes, neither of which was realized. One was that the Government's settlement of the railroad claims for losses during the period of control would give them means with which to buy equipment and do track work, thus helping the steel mills in their time of need. The other was that freight rates would be put down and the steel trade relieved in part of the heavy burden of transportation charges nearly double those of pre-war time.

The special hardship of the 40 per cent rate increase of August, 1920, on the raw material of steel making was put before the carriers time and again. Many of them conceded the force of the argument that there is no parallel in other industries for the hauling, often for long distances, of five tons of raw material for the making of one ton of finished steel product. But the railroad presidents were so engrossed with issues growing out of their relations with the labor unions that they could not take the plight of the steel industry into their thinking. Nor could they be made

to see how far any increased buying of steel that might result from lower freight rates on its raw materials would go in improving their own business.

From time to time predictions of betterment in the steel trade were put out, on the promise of legislation, favored by the administration at Washington, for the funding of \$500,000,000 of railroad indebtedness to the Government for property expenditures in the period of control. But this legislation never came through. Various settlements were made on war-time claims of the railroads against the Government, and following these there were belated payments of railroad obligations to the steel mills. Substantial relief to the railroads came in a 12½ per cent wage reduction on July 1 and in changes in shop rules made by the Railroad Labor Board in December, working savings of many millions of dollars per year.

Out of all the expectations of railroad buying entertained at the opening of the year the actual outcome was far below that of 1920. And 1920 was a year in which the railroads directly and indirectly, consumed not more than 15 per cent of the country's steel output. New cars ordered were only a fraction of the 84,000 placed in 1920, being only about 20,000, and locomotives ordered for domestic use were fewer than 250. The repair of 40,000 cars helped in a measure to make up to the mills what they missed in steel for new cars.

Production

The output of iron and steel in 1921 was the smallest since 1908, which was the year following the panic of November, 1907. Pig iron production last year we estimate at 16,400,000 tons and steel ingot production at 19,250,000 tons. Counting ingot capacity at 50,500,000 tons 1921 was thus a 38 per cent year. The output of steel ingots and steel castings together was probably not far from 19,850,000 tons. Comparison with the five preceding years is made in the table below:

	Pig Iron Gross Tons	Steel Ingots and Castings Gross Tons
1916	33,434,797	42,773,680
1917	38,621,216	45,060,607
1918	39,054,644	44,462,432
1919	31,015,364	34,671,232
1920	36,925,987	42,132,934
1921	16,400,000*	19,850,000*

*Estimated

The variations in pig iron production appear in the following statement of the number and daily capacity of the furnaces in blast at the beginning of each month:

	No. in Blast	Daily Capacity Gross Tons		No. in Blast	Daily Capacity Gross Tons
Jan. 1...	201	76,540	July 1....	76	32,195
Feb. 1....	188	70,500	Aug. 1....	69	29,175
March 1..	153	61,850	Sept. 1....	70	30,170
April 1..	102	41,530	Oct. 1.....	82	35,650
May 1...	96	39,105	Nov. 1.....	96	43,500
June 1..	90	37,085	Dec. 1....	120	51,665

In the low month of the year, July, 864,555 tons of pig iron was made. Not in 17½ years had any month yielded so low a total. In December, 1903, the country produced 846,695 tons.

The Year's Iron and Steel Exports

Starting in under the momentum of the 1920 movement which made the January total 547,394 tons, the export of iron and steel from the United States tapered down rapidly until in August, with 75,827 tons, a figure was reached lower than for any month since January, 1909. An encouraging but slow growth after August, month by month, brought the figure to 122,290 tons for November, which is 28.2 per cent of the November, 1920, movement. Up to Nov. 30 the total was 2,075,674 tons, or 47.15 per cent of the 4,402,056 tons for the first eleven months of 1920.

In only two items did the shipments last year exceed those of 1920 these being welded pipe and fittings,

Manganese Steel Made in Electric Furnace

Melting Practice for Castings Discussed—Use of Manganese Steel Scrap—Deoxidizing with Manganese Ore—The Heat Treatment

BY LARRY J. BARTON*

THE electric furnace has again shown its superiority over other steel-making methods. This time it is in the field of manganese steel. Up to a few years ago all of the American production of this metal was by means of the converter, the ferromanganese being added molten in the ladle. One company has made extensive trials with the electric furnace, over the last three years. Its results have been so gratifying that they have decided to replace all the

Tapping a Heat of Manganese Steel from an Electric Furnace in the Plant of the Southern Pacific Co.

converters with electric furnaces. Manganese steel, made in the converter, was considered very good steel, but electric steel is so superior in every way, that it might be considered a "super-manganese steel." The following paper is intended to cover this subject in detail.

Production and Uses

Manganese steel was first brought to the attention of the steel world by the researches of Sir Robert Hadfield, in England, about the year 1887. Its first introduction into the United States was in 1892 in the form of manganese steel castings. Since that time there has been a gradual increase in the tonnage until

*Metallurgist Southern Pacific Co., Sacramento, Cal.

the present time, when about 100,000 tons is the yearly capacity. This product is being shipped in quantity to all parts of the world, from the gold mines of Alaska to the great dredgers of South America. The great work of the Panama Canal was only made possible by the use of this metal.

Manganese steel is a steel of many uses. Being one possessing great wearing qualities and toughness, it finds unlimited use where abnormal strength is required. Dredge pins and buckets, rolling mill pinions, crusher parts, crane wheels, sheaves, tractor links, railroad frogs and switches, are some of its more important uses.

Physical Properties

Manganese steel, when heat treated, has the following properties as the result of a large number of tests:

Tensile strength, lb. per sq. in.....	100,000 to 110,000
Elastic limit, lb. per sq. in.....	50,000 to 55,000
Elongation in 2 in., per cent.....	30 to 35
Reduction in area, per cent.....	35 to 40
Brinell hardness	180 to 200
Scleroscope	40 to 50

Manganese steel is practically non-magnetic, and for this reason finds great use as a protecting plate on electric magnets. Most of the steel parts on the

*Hadfield, *Journal Iron and Steel Institute*, vol. II, 1888, p. 70.

famous North Pole "non magnetic" ship were made of manganese steel.

Its shrinkage is about 5/16 in. as against 1/4 in. for soft steel. This makes it a much more difficult metal to cast from the standpoint of the mold. Manganese steel when solidifying is prone to crack and check; and for this reason all corners or sharp edges are avoided wherever possible. Many castings must be shaken out while red hot and the cores broken in to overcome this trouble. Due to its great solidity

the shrink heads on castings must be larger than on carbon steel castings, and the gating must be very carefully done to avoid tearing during the cooling period.

Its Manufacture

The steel being described was made in a standard 3-ton Heroult furnace. This furnace was lined in the ordinary way, basic bottom, basic brick to above the

Part of a Battery of Heat-Treating Furnaces for Manganese Steel Castings

slag line, with silica brick from there up and a silica brick roof. Due to the heavy reducing conditions and the large amount of lime necessary in the slags, the life of the linings and roof are much less than on carbon steel. This has been overcome to a great extent by the use of what are known as "metalkase" brick. These are a metal lined magnesite brick which do not spall and give superior service when lined directly to the roof.

Manganese steel generally runs from 11 to 13 per cent manganese, with carbon 1.10 to 1.30 per cent. The main point in its successful manufacture is to keep the carbon always below this proportion, and if possible lower. Disregarding the remelting of manganese steel scrap, which will be taken up later, there are several methods of furnace practice available.

1. The metal can be melted under an oxidizing slag, the slag removed, a second slag added, and cleared under a heavy reducing atmosphere, as if carbon steel were being made. When the slag is white and powdering, the ferromanganese can be added in lots of several hundred pounds at a time and the bath brought to the proper temperature and tapped.

2. The heat can be run as above, adding the manganese after slagging off, before the final slag.

3. The heat can be melted, the manganese added and the steel finished under the first slag.

In the first two methods all the manganese in the

charge is wasted, flowing from the furnace in the first slag. This is saved by the third method. Then, too, there is a considerable saving of slag-making material by using the last method. The only objection to this method is the fact that if you melt down high in carbon you are faced with an off analysis. By carefully watching the charge and melting, this is a point which very seldom happens, and then only when having electrode breakage. Under the circumstances the last method has been adopted as the standard practice.

Melting Practice

The charge is either shoveled or thrown by hand into the furnace, depending on its character, care being taken that the scrap is so arranged that it forms as compact a mass as possible. This is an important point, especially in a shop where heavy penalties are imposed by the power company on high peak loads. The more compact the charge, the easier the melting down and the quicker the time for a steady load to be obtained. The lime, generally about 2 per-cent of the charge, can either be added with the charge or as the bath is melting down. During the melting the rust and scale on the scrap reacts on the carbon, man-

Quenching Tank for Treating Manganese Steel Castings

gane and silicon, cutting them down according to the reactions:

When using ordinary soft steel scrap containing carbon, 0.20 to 0.30; manganese, 0.30 to 0.50, and silicon, 0.05 to 0.20 per cent, the bath will melt down without any further additions of ore or scale to about carbon, 0.03 to 0.08; manganese, 0.05 to 0.10, and silicon, 0.01 to 0.03 per cent.

If a heat of low phosphorous is desired it will of course be necessary to draw off the first slag. As the phosphorous limit of around 0.06 to 0.08 per cent in manganese steel is easy to meet, it will not be necessary

End Section (Left) and Sectional Plan (Right) of Heat-Treating Furnace for Manganese Steel

to do this except in unusual cases. When the charge is all melted, any pieces of metal on the side walls are knocked into the bath and a preliminary test for

Mold (Left) for Test Bars and Bending Block (Right) for Bending Manganese Steel Bars

carbon taken. This can be either a fracture test by eye or can be a quick analysis by the chemist. As it is so easy to tell by a fracture test, the chemist is very seldom used for this preliminary. If your carbon is as low as desired it is time to go ahead. If not, scale or

Drop Test

Bend Test

Length to suit

Pulling Test

Test Bars for the Various Tensile, Bending and Drop Tests on Manganese Steel

ore must be added, the bath boiled and the carbon burned out until the test shows the carbon is low enough. The required amount of ferromanganese having been weighed out to give the desired analysis, it is added at the rate of 100 lb. per min., each lot being added through alternate sides of the furnace.

The slag is now given a dusting of coke dust or some other reducing agent and the final period begins. The slag slowly begins to turn from a black to a brown, then greenish gray, and is finally white, powdering to a fine powder in the air. This is not always the case, however, as the slag may hang up and remain a green or a blue throughout the heat. The best indication is the metal test, disregarding your slag entirely. This test is taken in a sand mold, made of two cores pasted together, poured on end. While still red hot

this test is quenched in water and broken on a block. If the bend is good the metal is ready to pour. If not, the bath must be held under further reduction and deoxidation takes place, according to the reactions:

the metals being reduced back into the bath and the oxygen going off as a gas.

Under the influence of this heavy reducing atmos-

Method Used in the Recording of Heats by Means of Bending Treated Test Bars

phere, together with the large amount of lime in the slag, nearly all of the sulphur is eliminated from the metal. This may take place in several ways:

Testing the Temperature

Assuming the metal test is now satisfactory the

Special Tool for Drilling Manganese Steel Samples

steel is examined as to temperature. This can be ascertained in several ways:

1. By means of the rod test. A soft steel rod is immersed into the bath for a pre-

Photomicrographs of Manganese Steel Castings; Etched with Nitric Acid in Alcohol and Magnified 125 Dia. The one at the left is the metal as cast and the other (right) is the steel after treatment. The composition was Mn., 11.89; C., 1.28; Si., 0.24; P., 0.04, and S., 0.02 per cent

determined number of seconds and the effect of the heat noticed by the way the end of the bar is eaten away. If cut off clean the metal is hot; if cut pointed the metal is medium, and if not cut at all or sculled the metal is cold.

2. By means of pouring over the lip of a small test spoon and noticing how clean the spoon pours, together with the appearance of the metal to the eye.

3. By means of drawing a spoon full of metal and taking the number of seconds necessary for the top of the metal to skin over.

The last method is the one now in use and the required number of seconds is close to 60. This test is reliable only when there is over 0.50 per cent silicon in the metal and as soon as the spoon is taken from the furnace small pinches of ground silicon are added to give this condition. While this test varies according to the initial heat of the spoon before filling with metal, in the hands of the same operator it proves very reliable.

When the steel is hot enough it is tapped, the ferro-silicon being added in small pieces to the ladle. Tea pot ladles are used and give very good service.

Analysis of Slags

The following shows the analysis of a few slags, recording the difference as the heat progresses:

	1 P.M. Dark Brown	2 P.M. Brown	2:10 P.M. Light Brown	2:45 P.M. White Powder
Silica	28.02	34.70	33.60	33.60
Iron oxide	20.70	16.00	10.00	9.40
Aluminum oxide	48.38	49.49	56.45	58.42
Lime	7.02	4.45	3.75	1.59
Manganese oxide				

Some slag losses on different heats are as follows:

Manganese in Steel, Per Cent	Manganese in Slag, Per Cent
10.53	6.45
11.11	1.26
11.92	6.67
11.26	2.79
	3.91

These were all on heats where the slag was difficult to clear and where the metal test alone was used to show condition of metal.

Logs of the Heats

Some of the actual heat logs were as follows:

Charge	Lb	Steel Analysis, Per Cent
Heads and gates (carbon steel)	800	Mn 11.62
Punchings	3,000	C 1.26
Turnings	650	P 0.055
Total	4,450	Si 0.45

CaO	None	0.17
MgO	None	0.13
S	0.20	None

Remelting of Manganese Steel Scrap

This is the one great point where the electric furnace shows its superiority over the older processes. Under the old system this scrap was remelted in an air furnace, very similar to an open-hearth, with the exception that there are no regenerative chambers. These furnaces were also used to melt the ferromanganese. Large losses of manganese occurred, with the resulting raise in the proportional carbon content, giving great trouble in keeping the carbon low in the final metal. With the electric furnace this is largely eliminated. The scrap consisting of old heads and gates, defective castings, etc., is melted the same as ordinary carbon steel scrap under a heavy lime slag. Then towards the finish of the heat all this manganese in the slag is reduced back into the bath.

The best success is obtained when the charges are rattled and cleaned from all adhering sand and scale. This lowers the oxidizing condition of the melting down period, tending to lessen the manganese slag contents. When the bath is melted, a sample is taken for the chemist to analyze for carbon and manganese. From this analysis the resulting charge of ferromanganese is calculated. These tests cannot be taken by fracture as the high manganese content of from 6 to 10 per cent changes the grain to such a point that any estimate is unreliable.

Some Heats of Manganese Steel Scrap

Manganese scrap, per cent	50.0	70.0	80.0	70.0	50.0
Condition	Rusty	Rusty	Rusty	Rattled	Rattled

	60	40	60	40	45
Mn, per cent, theoretical	13.43	13.29	14.14	13.22	13.25
Mn, per cent, actual	13.23	11.86	12.14	12.55	12.50
C, per cent, theoretical	1.30	1.25	1.33	1.29	1.29
Side walls:					
Before	OK	Thin	Thin	OK	OK

After Bottom: Before After Metal	OK Hole	Thin OK OK	Thin OK OK	Cut OK OK	Cut OK Cut
tapped, lb.	6,430	5,655	6,010	6,200	6,400
Kwh. total	2,500	2,500	2,500	3,000	3,000
Kwh. per ton	812	887	838	968	938
Time per ton	1:05	1:40	1:50	1:25	1:35

The above data were collected during the experimental period on remelting manganese scrap and the results are not as good as future practice developed, especially upon such points as time and power. Since that time many heats of 100 per cent returned scrap have been melted with no difficulty. This process is the greatest event in the history of manganese steel making, as it allows for the remelting of shop scrap and old worn out castings with no loss of the manganese alloy.

Manganese Ore as a Deoxidizer

When ore or mill scale is used to cut the carbon it is a known fact that the manganese is also oxidized and goes into the slag as MnO . It was therefore decided to try manganese ore in place of the mill scale. Theoretically this would cut the carbon and yet leave a high residual manganese in the steel, according to the reaction

This was tried with a heavy blue black manganese ore analyzing 50 per cent metallic manganese.

Manganese Ore versus Mill Scale

	Manganese Ore	Mill Scale
Number of heats taken for comparison	13	13
Average weight shop scrap in charge, lb.	1,421	1,290
Average weight total charge, lb.	7,225	6,827
Average weight total pour, lb.	7,028	6,661
Average melting loss, per cent	2.7	2.4
Manganese ore added per heat, lb.	36	
Average manganese in total charge, per cent	12.68	12.53
Average manganese in steel by analysis, per cent	11.61	12.11
Average manganese loss on total charge, per cent	8.45	3.35
Average carbon in steel by analysis, per cent	1.03	1.09
Average manganese-carbon ratio	11.29	11.10
Average preliminary carbon, per cent	0.27	0.19
Average carbon in charge, per cent	0.38	0.37
Average carbon oxidized from steel, per cent	0.11	0.18
Average kwh. per heat	3,154	3,384
Average kwh. per ton of charge	876	936

From these experiments it was found:

That the manganese losses were greater with the ore.

That the preliminary carbons and the final carbons were higher, due to the fact that not as much carbon was oxidized.

That it required less power when using manganese ore.

That the manganese-carbon ratio was better giving a final steel lower in carbon, even though higher at first.

That when the scrap was rattled and free of scale, the results were excellent.

The practice of cleaning the scrap and using manganese ore has now been adopted as standard practice. When used in this manner the ore is highly efficient.

Mn C	Ore Efficiency, Per Cent	Bend on Test Bar	Mn in Steel, Per Cent	C in Steel, Per Cent
10.30	97.4	Very good	13.88	1.35
11.20	73.5	Very good	11.72	1.05
11.30	90.5	Fair	11.72	1.14
10.50	91.0	No good	11.09	0.96
11.20	86.5	No good	10.76	0.90
10.85	64.5	No good	9.76	0.90
10.70	79.0	Good	11.24	1.05
11.65	101.0	Excellent	12.58	1.08
11.85	100.0	Excellent	12.08	1.02
11.85	90.0	Excellent	12.68	1.05
11.85	91.5	Excellent	11.97	1.01
10.15	96.5	Excellent	12.25	1.21
11.12	88.45		12.00	1.08

The following covers 86 heats, intermittent operation:

Average pour of metal, 6708 lb., or 3,354 tons.
Average charge, 6942 lb., or 3,471 tons.
Melting loss, 234 lb., 0.117 tons, or 2.55 per cent.
Time, 5 hr. 26 min.

Kwh. per ton of steel poured, 1002.
Kwh. per ton poured on first heat of day, 1655.
Kwh. per ton poured on second heat of day, 943.
Highest kwh. per ton of steel poured, 1885; lowest, 700.
Average manganese lost from total charge, 2.16 per cent.
Average manganese lost from ferromanganese, 1.26 per cent.
Average manganese effective from alloy, 98.74 per cent.
Average manganese in charge, 11.80 per cent.
Average manganese in steel, 11.63 per cent.
Average preliminary carbon, 0.18 per cent.
Average preliminary carbon using shop scrap, 0.26 per cent.
Using no shop scrap, 0.10 per cent.
Average pick-up in carbon from 100 lb. ferromanganese, 0.096 per cent.
Average manganese-carbon ratio, 10.77.
Average heats from roof, 25.
Average heats from lining, 35.
Electrodes per ton of steel poured, 33.8 lb.

The thermal efficiency of the furnace is represented by the following formula:

Weight of steel in kilograms \times specific heat + latent heat of fusion

Kwh. used \times calories per kwh.

Using: Latent heat of fusion as 20; specific heat of steel as 470; specific heat of basic slag as 600; slag equals 1/10 of steel by weight; and 1 kwh. equals 860 cal. we found:

Thermal efficiency of furnace, per cent	53.0
Total heat utilized in furnace, per cent	59.5
Total heat in steel, per cent	58.0
In slag, per cent	6.5
In cooling rings, per cent	2.55
Electrode holders, per cent	1.92
Transformers, per cent	1.23
Heat utilized in overcoming cold furnace plus radiation, per cent	34.70

Losses on the cooling rings, electrode holders and transformers were obtained as follows.

	Deg. C.
Water to transformer	19.8
To holder	22.6
From No. 1 holder	26.3
From No. 3 holder	27.3
Temperature of No. 2 could not be taken, drain pipe in the way	
From No. 1 ring	31.2
From No. 2 ring	32.7
From No. 3 ring	32.9

No. 1 ring	1 liter water in 4 1/2 sec., or 14 kg. per min.
No. 2 ring	1 liter water in 4 sec., or 15 kg. per min.
No. 3 ring	1 liter water in 4 1/2 sec., or 14 kg. per min.
Total	43 kg. per min.

Transformer:

(Temp. H_2O to holders — temp. H_2O to transformers) \times total kilograms equals calories per min.
(22.5 — 19.8) 43 equals 116 cal. per min

Holders:

(Temp. from holder — temp. to holder) \times kg. equals cal. per min.

No. 1 (26.3 — 22.5) 14 equals	53 cal. per min.
No. 2 (averaged) equals	60 cal. per min.
No. 3 (27.3 — 22.5) 14 equals	67 cal. per min.
Total	180 cal. per min.

Rings:

(Temp. from rings — temp. from holders) \times kg. equals cal. per min.

No. 1 ring (31.2 — 26.3) 14 equals	69 cal. per min.
No. 2 ring (32.7 — 22.5) 15 equals	93 cal. per min.
No. 3 ring (32.9 — 27.3) 14 equals	78 cal. per min.
Total	240 cal. per min.

Transformer, $\frac{116 \times 60}{860} = 8$ kwh.

Holders, $\frac{180 \times 60}{860} = 12$ kwh

Rings, $\frac{240 \times 60}{860} = 16.6$ kwh.

Total, 36.6 kwh.

4000 amp. \times 104 volt \times 0.90 power fac. \times 1.73 = 650 kw.

Transformer loss, $\frac{8}{650} = 1.23$ per cent

Holder loss, $\frac{12.5}{650} = 1.93$ per cent

Ring loss, $\frac{16.6}{650} = 2.53$ per cent

Grand total, 5.70 per cent

Heat Treatment of Manganese Steel

Manganese steel in its raw or untreated condition, as taken from the mold, is as brittle as glass and is not suited for any purpose. The castings are cleaned and loaded on small brick topped cars. These are put into the annealing furnaces, which are so built that the top of the car becomes the bottom of the furnace. These furnaces are oil-fired with the flame jets so arranged that a very even and soft flame is obtained.

Brighter Prospects Indicated for 1922

What a Study of Production, Prices, Failures, Finance and Foreign Trade Shows—Activity Evident in Construction—Much Depends on Disarmament

BY NATHANIEL R. WHITNEY, PH.D.*

IN the early part of 1921, the author of this article published a résumé of the business situation in which the obstacles to business revival were outlined as (a) the unsound economic conditions in other parts of the world; (b) the uncertainty as to prices; (c) the excessive issue of paper currency in European countries; (d) the burden of national debts of the world; and (e) the scarcity of capital. It was said that, "the most significant fact upon which to fix attention in endeavoring to predict recovery is the rate of interest for long-time loans. As this rate declines business will improve." Evidence was presented that the situation was already showing signs of improvement and attention was called to the gradual accumulation of capital. It was predicted that, although improvement had begun, the process of recovery would be slow.

Much has happened since that time and the scarcely discernible signs of improvement have now become more clearly marked, but the writer still feels that progress toward recovery will be slow. Anyone who predicts an immediate or rapid return to normal is merely deceiving others and seeking to delude himself. The accumulation of capital, increase in output, decrease in costs of production, readjustment of prices for various commodities to a more normal relation, and elimination or rather reduction of economic and political friction throughout the world—all these require considerable time. It is futile to look for restored prosperity, however, until these requisites are to a considerable extent achieved. But this does not mean that conditions cannot get better—in fact, there is plenty of evidence that they are improving and that they will continue to improve. Progress toward normal is not likely to be continuous; there will be an advance, then a halt or downward trend in certain industries, followed by another advance, and so on, each complete movement carrying business activity to a constantly higher level.

The 1921 Depression in Figures

If we divide the business cycle into the customary four sections—prosperity, decline, depression, and recovery—it is clear that 1920 and the early part of 1921 were in the period of decline. The greater part of the past year was in the depression area, while during the last few weeks of the year the indications pointed to recovery. The year 1921 was one of decline in prices, wages, and profits; of reduction in business activity as shown by bank clearings; of reduced productivity in many lines—iron, steel, bituminous coal, lumber, cotton manufactures. It was a year of record-breaking unemployment and of business failures on a large scale. In short, it furnishes the usual evidence of a period of liquidation.

The index for wholesale commodity prices, which in December, 1920, stood at 189, by the end of July had got down to 148. Since that time a slight advance has been noted. Bank clearings for the year up to the end of the first week in December were about 20.5 per cent less than the clearings for the corresponding period of the year 1920. For the first ten months of 1920 and 1921, the index number for production of bituminous coal was 122.5 and 92.3 respectively; for

receipts of lumber at Chicago and St. Louis 82.5 and 74.3; for pig iron production 133.2 and 58.7; for steel ingot production 126.2 and 59.5; for cotton consumption 116.3 and 96.3. The cotton crop for 1921 was estimated to be the smallest since 1895. The production of copper ranged about 20 for 1921. The production of crude petroleum showed a different tendency since the index for 1920 was 191.5 and for 1921 was 207. It is to be understood that normal production in each case is represented by 100. Gross earnings of 184 railroads for the first nine months of the year were 7.83 per cent less in 1921 than for the same period in 1920.

A marked falling off in the value of our foreign trade occurred. For the eleven months ended November, exports for 1920 were \$7,508,000,000, and for 1921 \$4,191,000,000; imports for 1920 were \$5,012,000,000; and for 1921 \$2,272,000,000. The excess of exports over imports for 1920 was \$2,496,000,000, while for 1921 it was \$1,919,000,000. The decline in the physical volume of our trade has not been so marked as these figures would indicate for allowance must be made for changes in the price level.

Earnings of labor during the year have shown considerable reduction although the rate per hour for some groups of labor has not yielded much. The reduction in earnings was due to the elimination of overtime pay, to either a reduced number of working days or complete unemployment, and to reductions in the wage rate for many employees.

The Maladjustment in Prices

The complete story of changes in the price level would not be told unless attention were directed to the uneven decline for different groups of commodities. The following table illustrates these variations. The figures are those compiled by the Bureau of Labor Statistics and are based on the prices of commodities at wholesale. The first column gives the highest figure reached by each group (although it should be noted that these high points for the different commodities were not all reached at the same time); the second column gives the index number for the first of September, 1921.

	Highest	Sept. 1, 1921
Farm products	246	118
Metals	195	120
Food, etc.	287	152
Chemicals, etc.	222	161
Cloths and clothing	356	179
Fuel and lighting	284	182
Building materials	341	198
House furnishings	371	230
Miscellaneous	247	147

An examination of this table demonstrates that the producers of certain of these commodities are at a disadvantage when they purchase from some of the other groups. For example, at the date here given farm products were only 18 per cent while house furnishings were 130 per cent above normal. These are the extremes but it is clear from the figures that there is still maladjustment in the prices of many different commodities. So long as this situation prevails the producers whose commodities have declined most in price will be unwilling to purchase the commodities which are selling much above their normal level. It has been estimated that the farmer's dollar purchases fewer commodities now than it has at any time during

*Professor of Finance, University of Cincinnati.

the past thirty years. The tremendous slump during the past year in the sales of the mail-order houses, a large part of whose business is obtained from the farmers, furnishes striking evidence of the fact that the uneven decline in the prices of the various groups of commodities is responsible for much business stagnation. Fortunately the position of the farmer seems more favorable for the future since the decline in the price of his produce cannot go much further.

Corner Probably Turned

The rapid and uneven decline in prices has played havoc not only with the farmers. The record for commercial failures during the year as reported by Dun is an extremely bad one. The following table is of interest in this connection. The failures for each November during the past few years were as follows:

	No of Failures	Liabilities of Failed Concerns
1918.....	570	\$13,815,166
1919.....	551	9,177,321
1920.....	1,050	30,758,130
1921.....	1,988	53,469,839

For the eleven months of each of these years the figures were as follows:

	No. of Failures	Liabilities of Failed Concerns
1918.....	9,299	\$150,770,496
1919.....	5,890	104,990,805
1920.....	7,366	236,250,260
1921.....	17,207	639,899,501

In spite of the difficulties through which we have been passing and in spite of the obstacles yet to be overcome, we are undoubtedly in a very much better position on the threshold of 1922 than we were at the beginning of 1921. We have endured the rigors of a serious industrial depression and while we cannot look for immediate restoration to great activity, nevertheless it seems probable that we have turned the corner and are on the way to betterment. However, before we can correctly interpret the signs along the way it is necessary to know the goal. We are seeking prosperity. It is essential therefore to know upon what foundations prosperity rests.

That the basis of prosperity is not correctly understood by the majority of persons has been shown by events of the past two or three years. Toward the close of 1919 and early in 1920, trained observers of business movements were forecasting the proximity of an industrial depression. These predictions were made in the midst of a period of extraordinary business activity. There was an insatiable demand for labor at the highest wages ever paid. Wage earners were spending these unprecedented incomes with a lavish hand. On all sides were persons who had made and who were still making huge profits from a great variety of industries—farming, manufacturing, selling, and speculating. In the face of these conditions there were observers who predicted that the end was near. On the contrary, many writers in the newspapers and financial journals, and most business men were very impatient with such pessimistic predictions. The outlook seemed rosy. A prominent financial journal said, "The year now beginning gives promise of being one of the most active industrially in the world's history."

Why So Many Misinterpret Conditions

It required only a few months to demonstrate conclusively which of these predictions was correct. What knowledge did the one group possess which the other group lacked or ignored? The facts were available to everyone; yet the great majority of persons accepted the erroneous point of view. How can this be explained? The answer is clear. The vast majority were deceived by surface conditions. Because business was active, labor fully employed, and retail selling going on in large volume, and because it was evident that the world needed large quantities of goods of all kinds, it was assumed that prosperity must necessarily

result. There was well-nigh universal failure to look beneath the surface and to inquire upon what foundation prosperity really rests.

Prosperity may be said to stand on three legs—(1) a large and expanding scale of human wants; (2) productive capacity to satisfy the bulk of these wants; and (3) the provision of facilities and resources to maintain and improve the situation.

The visible evidence of a state of prosperity consists of the steady employment of the majority of employable workers, a noticeable improvement in the general standard of living, and the accumulation of capital in large quantity. It is extremely difficult to evaluate and measure prosperity in specific terms; and this difficulty is not made less troublesome by the fact that so far as surface appearances are concerned a period of activity preceding an industrial depression is nearly identical with a period of prosperity. There are, for example, in both periods great demands for laborers, great activity in retail buying, and considerable launching of new enterprises. This similarity explains why many people form an incorrect judgment of the economic situation.

How to Tell Bogus Prosperity

Although the two periods look alike, the difference between them is fundamental. In a community which is really prosperous, the physical volume of production is increasing, and a considerable portion of the output of industry is embodied in the form of capital goods—raw materials, machinery, buildings, etc.—used for the purpose of aiding production thereafter. In a period of bogus prosperity production is either falling off absolutely or is not increasing at a rate as rapid as should be expected. Furthermore the character of production differs. Output consists to a greater extent of consumers' goods than of producers' goods or capital.

The final test of prosperity is capacity for self-perpetuation. The question is, in which direction are we headed? In a period of real prosperity we are not only enjoying a rising standard of living but are building a firm foundation for the maintenance and improvement of that standard. In a period of false prosperity we are devoting our energies to the gratification of immediate wants with little regard for the future. This leads to an undermining of industrial morale which affects both employers and employees, and the ultimate result of which is a falling off in the total volume of production. Since prosperity depends upon an ample supply of want-satisfying goods, anything that causes a decrease in the output of such goods undermines prosperity. Is there any evidence that the bases of prosperity as here defined are being prepared?

While it is the opinion of the writer that real improvement has occurred in the business situation, the evidence of improvement is to be found in underlying financial conditions rather than in superficial commercial conditions. But this is as it should be; there can be no real improvement in commercial conditions—in retail sales, activity of manufacturing, in employment of labor—until financial conditions are sound.

Distinguishing Credit from Capital

The fundamental requirement for a solid financial structure is an ample supply of capital. Capital should be sharply distinguished from credit. Credit is merely the device by means of which capital is rendered transferrable from those who do not wish to use it themselves to those who do desire to use it. Capital consists of accumulations of material goods or wealth; credit consists merely of commercial and banking instruments which furnish a temporary claim to such wealth. Capital is accumulated only by production and saving; credit may be manufactured within

certain limits by the banks. These limits, while flexible to a degree, are fixed by the supply of real capital, and the credit advanced by the banks must ultimately be liquidated out of capital.

The confusion between these two is responsible for many of the unsound proposals advanced for restoring business activity. It is responsible also for the many bitter attacks which have been made during the past two years upon the Federal reserve system. We seem to feel the need for a "personal devil" in financial as well as in spiritual affairs. It is known that the Federal reserve banks have the power to provide credit in large volume. It is not so well known that it is the duty of these banks to maintain a proper relationship between the supply of credit and the supply of real capital. It was only when credit was being used beyond the point where a safe relationship was maintained between credit and capital that the Federal Reserve Board called a halt. That it was necessary to put on the brakes when they did can scarcely be doubted by any careful and unprejudiced observer. It is incredible that anyone can seriously believe that there would have been no depression if the Federal reserve system had not been in existence. The lack of balance between credit and capital was bound to bring on a depression under any circumstances, and it would have been very much more serious in the absence of a regulative body such as the Federal Reserve Board to exercise financial common sense.

Interest Rates as the Clue

Since financial conditions are more fundamental and more significant than commercial conditions and since the supply of capital is the most important of the financial factors, the interest rate for real capital—that is, the rate charged for the use of long-time funds, as distinguished from the rate charged for short-term loans, which are based largely upon the supply of credit—indicating the relation between the supply and demand, is the most significant single clue to the business trend.

There is ample evidence that capital is becoming available in larger amount. The following table indicates the change in the interest yield of a few selected bonds between the beginning and the end of the year.

	Yield, Per Cent—	
	Mid-January, 1921	Mid-December, 1921
4th Liberty Loan 4½s (1938).....	5.34	4.36
New York City 4½s (1960).....	5.07	4.34
Dominion of Canada 5s (1931).....	6.52	5.13
United Kingdom 5½s (1937).....	7.01	5.79
Atchafalpa General 4s (1995).....	5.16	4.68
Northern Pacific 4s (1997).....	5.16	4.72
American Tel. & Tel. Co. 5s (1946).....	6.46	5.40
Armour & Co. 1st 4½s (1939).....	6.48	5.20

These figures may be supplemented by other evidence. For example, new bond issues of states and municipalities for the first nine months of this year exceeded by about \$250,000,000 the issues for the corresponding period of 1920, and far exceeded such issues for many years preceding. A large issue of Pennsylvania State bonds was sold during November at a net interest cost of approximately 4.35 per cent. The recent New York State issue of \$55,000,000 was oversubscribed four times. Investment bankers in all parts of the country testify that their problem is not that of selling bonds, but rather of getting sufficient bonds to meet the requests of their customers.

Despite the depression, deposits in eleven savings banks in New York City are considerably higher now than they were at any time during 1920. Although the deposits in the postal savings banks have declined during the year, the December bulletin of the Postal

Savings Department calls attention to a slight but steady increase in deposits in the smaller post-offices throughout the country. The chief losses in deposits have occurred in the large cities and industrial centers. In considering the status of savings deposits, account must be taken of the fact that a considerable part of the savings which have been withdrawn from banks and the postal department have gone into the purchase of bonds and other securities selling at bargain prices.

With the increase in the supply of capital and the resultant strengthening of the banking position, there has come an easing of the credit strain. Loans of the Federal reserve banks, which reached their highest level in October, 1920, had declined more than one-half by the close of 1921. About the beginning of January, 1921, the reserve ratio against notes and deposits in the Federal reserve system started upward from 44 per cent and progressed steadily, reaching nearly 73 per cent during the week ending Dec. 3. This increase in reserve ratio was brought about by an increase in gold reserves from \$2,059,333,000 in the first week of January, 1921, to \$2,849,397,000 in the first week

of December; by a decrease in Federal reserve notes from \$3,344,686,000 to \$2,366,006,000; and by a decline in deposits from \$1,846,093,000 to \$1,728,497,000 during the same period. The discount rate in the reserve banks now averages about 5 per cent for all classes of paper, and in some of the Eastern districts a rate of 4 per cent is predicted for the near future.

Unsatisfactory Foreign Financial Situation

While domestic financial conditions are sound and are improving steadily, foreign financial affairs are still unsatisfactory. The committee appointed by the Chamber of Commerce of the United States to study economic conditions in Europe emphasized the fact that real recovery in the United States cannot be attained without great economic improvement in Europe. The committee enumerated as requisites for recovery in Europe, (1) appreciation of foreign exchanges; (2) growth of export trade; (3) reduction in governmental expenditures; and (4) strengthening of bank reserves.

As to the first of these, the present situation is unsatisfactory. The trend of practically all European exchanges has been downward since the Armistice—the general index for foreign exchange having declined from December, 1918, when it was slightly above par to September, 1921, when it was just a little above 50 per cent of par. This average was carried down mainly by the great decline in marks, although other monies declined heavily also. English exchange has shown improvement during the past year, being 71 points higher in the week ended Dec. 17 than it was during the first week in January. There has recently been a marked advance in sterling and slight improvement in French and German exchange. If this upward movement is maintained better financial conditions in Europe will be indicated. With improved financial conditions there will come increased demand for American commodities and a resulting stimulus to American business.

Healthy Trend in Foreign Exports and Banking

Recent reports on the trade of leading European nations call attention to the growth of their exports. Steady progress in exportation is being made by England, France and Germany. While the exports of none are equal to their pre-war exports the tendency is a healthy one.

Little advance has thus far been made by European

The four sections of a business cycle:

PROSPERITY
DECLINE
DEPRESSION
RECOVERY

The greater part of 1921 was in the depression area.

Indications of last few weeks of 1921 point to reaching recovery.

nations in reducing government expenditures. In the case of some nations the annual revenue of the government does not equal its expenditures. It is to be hoped that the Conference for Limitation of Armaments will reduce the danger of war and the need of war preparations so that government expenditures for all nations may be sharply curtailed.

As to the fourth requisite, there is evidence that the banking position is being strengthened in most countries. Germany and Russia are the outstanding exceptions to this improvement. The weakness in these countries is due to their reckless issues of inconvertible paper money. In Germany the quantity of paper marks has increased from 1,890,000,000 in 1914 to more than 86,000,000,000 at the end of September, 1921. The amount now probably exceeds 100,000,000,000 marks. Against these issues of notes there was held in the banks at latest report something over a billion marks in gold. This indicates a gold reserve against note issues of about 1 per cent—a reserve totally inadequate to maintain the value of the paper money.

Banking conditions in South and Central America and in Cuba, while still very unsatisfactory show improvement. In China, however, the banking situation is ominous. Runs on all the Chinese banks have been heavy, and the leading banks recently suspended payments to depositors and noteholders. A number of American banks have lost heavily through operations in various foreign countries and it is a noteworthy fact that a considerable proportion of the foreign branches established during the war and immediately following have been closed in some cases temporarily, but in many cases permanently. Financial conditions outside the United States are thus seen to be in general unsatisfactory but, except for a comparatively few localities, are improving.

Signs of Commercial Improvement

As was said earlier in this review improvement in commercial conditions is not thus far so clearly marked as in financial conditions. However there are a number of indications that the situation is mending and the improvement will soon be sufficiently noticeable to attract general attention. The number of business failures as recorded heretofore is curiously enough a hopeful sign, for it indicates that weak and inefficient businesses are being driven out of existence and that sound concerns can therefore make progress without being hampered by the existence of unsound competitors. Failures always become very frequent and the total of liabilities becomes very large toward the close of a period of depression. While the number of failures is likely to be large for some months to come, the tendency will undoubtedly be toward fewer collapses.

Rapidly declining prices have had an unsettling effect upon the market and have hampered production, but it is now possible to note improvement in this respect. Within the past few months greater stability has been shown in prices both in the United States and in Great Britain. This enables purchasers to stock up with goods in larger volume since there is less danger now of decline in price. This is only a temporary phase, however, for the prices of many commodities are certain to work lower. Unemployment which has been very serious is, according to reports of the Department of Commerce, decreasing. During October, 44 out of 65 selected cities showed a net increase of persons employed of 1.01 per cent over September.

Reports from the retail trade also indicate improvement. While the total value of sales in dollars is smaller than last year because of price decline, the actual amount of goods sold has apparently held up fairly well and has recently shown a tendency to

increase. Sears-Roebuck sales gained 17.3 per cent in October over September. Montgomery Ward & Co. showed a 21 per cent gain. The sales from Woolworth stores during the first ten months exceeded those of 1920 by 3.18 per cent, while the sales of the Kresge Co. exceeded 1920 by 8.6 per cent. Reports collected by the Federal Reserve Board from 872 department stores showed a decline in value of sales of 6.2 per cent in October, 1921, as compared with October, 1920, but this figure for October shows an improvement over the September business; and in volume of sales October, 1921, exceeded October, 1920, by nearly 20 per cent.

Construction Activity in 1922

The best prospect for improvement is found in the tremendous amount of construction in all lines, which only awaits a favorable opportunity to begin. It has been estimated by Walker D. Hines, formerly director general of railroads, that the railroads must spend more than a billion dollars a year for some years to come if the transportation facilities are to be kept equal to our needs. The great demand for tax-free municipal securities has stimulated the issue of such bonds to an unprecedented extent. Hence states, cities, and minor civil divisions have obtained funds with which they are planning to carry on public works, such as road construction, erection of public buildings, and similar projects. This will create a demand for structural materials and labor, which added to the private demand for housing and investment property will work considerable improvement in conditions during 1922. Architects in the various cities of the country agree that plans and estimates in their hands for the construction of dwellings and other properties in the near future will give a considerable stimulus to business. Building material dealers report large inquiries for building projects to be undertaken in the spring.

The movement toward increased construction made headway even during 1921. Despite the decline in prices as compared with 1920, the figures for new building in October, 1921, were 25 per cent greater than for October, 1920. The value of construction during the first ten months of 1921 was nearly equal to all of the construction for the whole year of 1920. The increase in the supply of capital has made funds available also for corporations. This will undoubtedly stimulate construction work by railroads and other public utilities. From all these points of view, therefore, it seems reasonable to expect that 1922 will show a tremendous increase in construction activity. This will in turn be reflected in improvement in all other lines of industrial activity.

Importance of Disarmament Conference

Finally, attention should be called to the possible betterment which would be inaugurated by a successful termination of the Disarmament Conference. It has been estimated that the head of every family of five in the United States is paying nearly \$100 per year in taxes solely for war debts and in preparation for future wars. The people of other nations are hit even harder. While a cut of \$200,000,000 in American naval expenditures would of itself have only a slight effect on the individual's tax bill, a corresponding reduction by England and Japan, to say nothing of the reduction in military expenditures by all the nations of the world, which may result from the conference, will have a tremendous influence in setting free large sums of capital now devoted to war preparation for use in private commercial enterprises.

There is universal complaint in this country that heavy taxation is hampering business revival. The obvious place to begin reduction in taxes is in the war budget. It has been estimated that the cost of maintaining the Navy Department, the War Depart-

ment, the Veteran's Bureau, paying pensions, and meeting interest on the public debt, will for 1923 be a little less than three billion dollars or 83 per cent of the total national budget. Any plan which makes possible the reduction of these expenditures immediately and

which looks toward still greater reductions in the future cannot help but have a remarkably stimulating effect upon economic activity. A favorable outcome of the conference may be counted on to hasten business revival.

Enameling Cast Iron and Steel Materials

Methods and Apparatus Used—Care Needed in Preparing Surfaces for Treatment—Burning on the Enamel

BY F. L. PRENTISS

ONE of the indirect results of the World War was the development in this country of the manufacture of cast iron enameled apparatus with high acid-resisting qualities, for use particularly in the chemical and pharmaceutical industries. Equipment of this type, formerly largely imported from France and Germany, is now being made by several American manufacturers. Cast iron enamel lined products used in these two industries include such equipment as shallow dishes for evaporating purposes, open and closed top kettles, both jacketed and unjacketed, stills for vacuum and pressure work, digesters and condensers, equipment used primarily in industries where the various processes cannot be carried on in contact with metal containers.

One of the pioneers in this industry is the Elyria Enameled Products Co., Elyria, Ohio, which established a plant several years ago under the name of the Enameled Pipe & Engineering Co. to enamel pipe used in mining and other industries requiring pipe with an acid resisting coating. Later the company, under its present name, turned its attention to the manufacture of various lines of enameled steel equipment used in the dairy industry, including ice cream making processes, in the manufacture of edible foods and oils in the preparation of canned foods, and apparatus used in the chemical and pharmaceutical industries. The demand for enameled lined steel equipment has grown rapidly the past few years, particularly from the milk handling industry. The company added a cast iron enameled ware department during the war time period.

In general, the steel apparatus is provided in much larger units than the cast iron utensils, and is used in such fields as the dairy industry, which does not require containers with the higher acid resisting qualities necessary for the more severe chemical conditions met in the chemical industries. Consequently, the cast iron apparatus is enameled with an entirely different formula from that used in enameling steel equipment.

Enamels prepared according to two formulas are used for steel, one for the dairy industries and the other for ware calling for more severe organic acid-resisting qualities. Cast iron enameled ware is being produced with high acid-resisting enamel, for use with mineral acids; but it is stated that the application of this mineral-acid-resisting enamel on steel is not practical.

The plant of the Elyria Enameled Products Co. has two separate manufacturing departments for the two lines of products. In addition, there is an assembly department where the finished parts are put together after the necessary machine operations. The shop in which the steel apparatus is fabricated, known as the tank shop, is equipped with two 5-ton electric traveling

cranes. The assembly department has a 7½-ton crane operated on a runway 36 ft. above the floor, and providing sufficient head room for assembling jackets on large tanks.

Enameled steel equipment is made of basic open-hearth steel, complying with boiler steel specifications, but not running over 0.15 per cent. in carbon, as difficulty is found in enameling steel higher in carbon, for blisters are likely to occur in the enameling. Various pressed steel shapes of thickness lighter than ¼ in. are fabricated outside the plant. Most lighter stock ranges from 16 to 24 gage.

For apparatus made in the shop, ¼ in., 5/16 in. and ¾ in. stock is used. The apparatus consists generally of cylindrical units with closed or open tops, and with various openings. After the stock is sheared, a cylinder is formed to the desired diameter on a Cleveland bending roll with a capacity for stock 1 in. thick and 13 ft. long. The longitudinal seam in the tank is made by oxy-acetylene welding; and the bottom, as well as the top, if it is a closed tank, is similarly welded on. Arc welding is used to a certain extent. The plant has 24 gas welding stations each using a No. 8 oxy-acetylene welding torch.

Seamless steel enameled tanks are made as large as 132 in. long and 120 in. in diameter, tanks of this size being used with apparatus made for the manufacture of condensed milk. In making the tanks, it is necessary that the surface to be enameled be smooth and clean. After the tank is assembled and the necessary openings are provided, the welds are ground down with portable electric grinders, and then the entire surface is sand blasted. Gas pockets and laminations in the steel, certain types of segregations and dirt on the surface, are the principal sources of trouble in enameling, resulting in blisters. Small imperfections found during enameling can be covered with additional coats of enamel, but it is impractical to try to cover up serious defects. Instead, all the enamel already on is sand blasted off and the piece is re-enameled. Sand blasting large units

Trimming, with a Bevel Shear, the Plate from Which a Tank Is to Be Made

Shaping the Plate to Its Cylindrical Form on a Bending Roll

requires one of the largest sand blast equipments ever built. This consists of four adjoining sand blast rooms, 15 ft. high and 20 ft. deep; two are 15 ft. wide and two 10 ft. wide. The sand blast plant, which was designed to meet special requirements, was supplied by the J. W. Paxson Co.

After sand blasting, the tanks are ready for the

equipment is usually confined to drying the interiors of units with closed tops. The drying equipment consists of small portable Buffalo Forge Co. blowers placed on pipe frame racks about 4 ft. high, mounted on casters. A movable table, that is raised and lowered by means of a cable and wheel above the rack, provides a base for the blower, which permits setting the blower at the proper elevation to discharge into the opening in the tank, standing on the shop floor.

For burning the enamel, direct fire furnaces are used, the practice differing from that followed by makers of enamel d kitchen ware, who generally use furnaces of a muffle type. Three furnaces are installed, one with doors 6 ft. square, one with doors 9 ft. square and a third with doors 14 ft. square, the largest furnace being 18 ft. deep.

The two larger furnaces are designed for firing with gas or fuel oil, but the latter is now used, the oil being vaporized in the burner. The small furnace is gas fired. The furnaces have double doors, which are hydraulically operated, their operation being similar to doors of open-hearth furnaces. Blast for the two large furnaces is supplied by General Electric centrifugal blowers . 3-lb. pressure, the larger supplying 3800 cu. ft. of

Welding the Seam on a Large Tank

enamel, which is applied to the surface in various ways. In plants making kitchen ware, the ware is dipped in enamel, but as this ware is not made in the Elyria plant, the dipping process is not followed. In enameling long pipe, the pieces are placed in an inclined position and the enamel is poured through while the pipe is rotated.

Enamel is applied to steel apparatus of large dimensions by the spraying process, by means of deVilbiss & Paasche air atomizers. In enameling a large closed top tank the operator of the spraying device works from the inside, getting into the tank through a manhole. Usually about four coats of enamel are applied, each coat being burned on in a furnace after it is dried.

Portable blowers circulating a cold blast are used for drying the enamel, but the use of mechanical drying

Grinding Off the Burr After Welding

Sand-Blasting a Tank in One of the Sand-Blast Rooms, Prior to Enameling

free air per minute, and the smaller 2500 cu. ft. The furnace equipment was supplied by the General Combustion Co.; furnace temperatures are taken with Brown recording pyrometers.

The two larger furnaces are charged with special Morgan type charging machines, having all the movements of a standard open-hearth charging machine, except the circular and turning over movement of the charger. These machines are electrically operated from a pulpit. In operation, a special burning rack is pre-heated, and then withdrawn from the furnace on the charger and the piece placed upon it. The furnace temperature for burning ranges from 1800 to 2000 deg. F., depending on the size of the piece. After the final coat of enamel is fired, the part goes to the assembly department.

Methods followed in the enameling of cast iron differ somewhat from those used in enameling steel. The utensils made in the cast iron enameling department are mostly kettles and stills, which are made up to sizes requiring castings 1500 lb. in weight. These utensils are made of special iron of a dense structure.

The castings, on going from the foundry, are first ground, then pickled, and then burned out in a furnace;

then, after sand blasting, they are ready for enameling. The enamel is burned on cast iron in two coal-fired, muffle type furnaces. Two charging machines are provided for charging these furnaces, one electrically operated and one hand operated.

In enameling a cast iron shape, a ground coat is applied with spraying apparatus. After drying, the work goes to the furnace, and is brought close to a bright red heat. From this point the enameling process departs from that in enameling steel. Instead of spraying liquid enamel on after the part has become cool, as in the case of steel, the enamel is applied in the form of fine dry powder, which is sprinkled on the part while hot

Spraying Enamel Upon the Inside of a Tank

by means of a device known as a "dredge," which consists of a sieve and air-operated vibrator.

During the enameling operation the part rests on a turntable in front of the furnace. By means of the turntable the ware is rotated, tipped to any angle, or, if desired, turned completely over, so that all parts to be enameled can be reached. The turntable is equipped with two motors, one for revolving in a horizontal plane

Method of Charging a Tank into the Burning Furnace After Enameling; the Charging Machine Is Similar to an Open-Hearth Charging Machine

Applying Dry Powder Enamel to a Hot Cast Iron Tank Head After the First Coat of Enamel Has Been Burned On. The piece is handled on a power-operated turntable by which it can be turned to any position so that the enamel can be applied to the entire surface

and the other for raising it on its vertical axis. Other movements are accomplished with compressed air. Beneath the turntable is a hydraulic plunger, which, after the enamel is applied, raises the piece up to a point where it can be picked up by the charging machine and again placed in the furnace.

The operations of burning and enameling continue until the desired thickness of enamel is produced. The work is kept in the furnace from 10 to 30 min., or long enough to bring it to a sufficient temperature to fuse the enamel down to a fairly uniform coat. After the final coat the work is given a longer firing than for the other coats, and the finished part comes from the furnace with a smooth surface and high gloss. All enameling of both steel and cast iron is done in blue, although any other color could be used by mixing the desired pigment into the enamel.

The plant has well equipped laboratories, the laboratory organization including ceramic engineering, chemical engineering, metallurgical engineering and analytical departments. The ceramic engineering department

has supervision over the preparation as well as the processing of the enamel in the factory, and specifies the proper enamel to be used to meet certain conditions. The chemical engineering department functions with the sales department in specifying the proper equipment to meet conditions of a given inquiry, and in developing new uses for enameled ware. The metallurgical department deals with the metallurgical problems, including selection of steel, cast iron, etc. Adjoining the ceramic laboratory is a furnace room, containing a complete experimental enameling plant. The laboratory of pyrometric equipment consists of a Leeds & Northrup potentiometer and optical pyrometer, a Thwing radiation pyrometer and a Brown portable pyrometer. This equipment is used in checking factory pyrometer equipment, as well as in experimental work.

Electric Developments in 1921

Under the above heading the General Electric Co. has made a comprehensive report of new designs of apparatus and methods of use of apparatus brought out during the past twelve months, with particular reference to the products of that company. The great bulk of the development reported has been along purely electrical lines, and largely for power plant use. Many improvements are reported, however, in motors and motor control for industrial use.

In electric arc furnaces, two new brass furnaces have been brought out during the year, one of 1500-lb. capacity and the other of 50-lb. Both are worked on the muffled arc principle, and either will melt practically any metal requiring a pouring temperature not exceeding 2370 deg. Fahr.

Particularly adapted for use in the larger non-ferrous metal foundries, the 1500-lb. unit is for three-phase operation, with a power consumption of not over 270 kwhr. per ton. The power factor is 95 per cent or better, and the metal losses are reported very low, being less than 1½ per cent for yellow brass and less than ¾ per cent for red brass. The 50-lb. unit should find a large field in small jobbing foundries, manufacturing plants, laboratories, etc. Its main characteristics are the same as for the larger furnace, except that it is single phase, and its power consumption is from 35 to 40 kwhr. per 100 lbs.

The National Association of Building Trades Employers will hold its annual convention Jan. 12, 13 and 14 in Cleveland.

Steel Tanks Under Hydraulic Test After Partial or Complete Assembly

The Operation of Basic Electric Furnaces

How to Avoid Delays in Each of the Eight Major Operations of Making Steel in Furnaces Having Movable Electrodes

BY M. W. CARUTHERS*

IN the operation of an electric arc furnace for the manufacture of steel, delays occur which are of much the same general character as those encountered in the open-hearth and Bessemer process, although differing where different methods are required for their manipulation. There are two kinds of delays: Avoidable, or those within the control of the manufacturer, and the unavoidable delays, or those of which the steel maker has no control, such as interrupted power service, crane breakdowns and numerous others of which no further mention is necessary. Both kinds of delays are an absolute loss to the steel maker in that they are enemies of production and will be treated as such in this paper.

The avoidable delays may be classified as those occurring in the eight major operations of an electric arc furnace: Charging, melting-down, slag formation, refining, decarbonizing, recarburizing, addition of ferro-alloys and breakage of electrodes.

Charging

There are two types of electric furnaces, with reference to charging, which are being used for steel making. One type has a stationary roof and the charge is thrown in through the doors on the sides of the furnace, while the other type is so designed that the roof can be raised to allow the charge to be placed in the furnace by an overhead crane.

The majority of the stationary roof type furnaces are charged by hand because the door openings are not large enough to permit a charging box of an economical size to be used by a charging machine. A review of the melt sheets will show that many minutes are consumed in hand charging that could be utilized for melting down if mechanical charging were possible or if a raisable roof type furnace were used. As mentioned above, the raisable roof type furnace is well adapted for crane charging and the time consumed in charging will be cut to a minimum providing sufficient crane service is available to take care of the pouring of the heat and the handling of the charging boxes without delaying the execution of either. The charging boxes should have collapsible bottoms so that they could be operated on somewhat the same principle as a clam-shell bucket and they could then be lowered into the furnace and the charge released with the least possible time-loss and damage to the furnace lining and bottom.

However, it is possible to remove the roof from a stationary roof type furnace, which is the one in most common use, but this requires a crane, which means that the roof must be lowered to the floor to liberate the crane so that it can pick up the charging boxes. This constant handling of the roof would shorten its life considerably, and, no doubt, would counteract the advantage to be gained by roof charging. Assuming then that hand charging through the doors is the method most commonly used, a system with regard to charging of the scrap should be followed that will bring the most

efficient melting down conditions. The importance of systematic charging can be easily determined by noting the shorter period of time required for melting down under this condition.

Heavy Scrap First

Heavy scrap, such as scrap ingots, crop ends, butts, cogging scrap, heavy gates and risers should be charged first on the bottom of the furnace and as nearly in the path of the electrodes as possible. This arrangement will retard the movement of the electrodes down through the charge until enough scrap has been melted to form a pool of molten metal on the bottom. Ladle skulls should be charged next, care being taken that they are not exposed where the electrodes will touch them when the charge is all in the furnace, for in most cases they are poor conductors, due to uneven surfaces and adhering refractory materials. The lightest scrap should be charged last and should be thrown into the furnace so that the center is kept full. If this precaution is not taken it will be impossible, at times, to get all of the charge in at one time and further charging will be necessary. Considerable time is usually lost with the additional charging operation, and the above-mentioned process, if followed, will be found to be advantageous. If there is any great amount of light scrap, difficulty will sometimes be encountered in getting a good contact, which may be overcome by placing a piece of heavy melting scrap directly under each electrode.

Care of the Bottom

It will be appropriate to mention a few rules that should be followed in the care of the bottom of the furnace. Attend to any bottom trouble promptly after the heat has been tapped while the steel in the hole is still in the molten state.

When the furnace bottom is in good order, drain it as free as possible from molten steel before charging. If there is molten steel pocketed that will not drain out, mix it thoroughly with refractory material such as dolomite, magnesite, or any of the preparations that have been found to be satisfactory for bottom repairs, by means of a rabble bar, and pull as much of the conglomerate mass out of the furnace as can be pulled out. This measure of precaution will be rewarded by fewer shut downs, necessitated by the burning in of a new bottom or the cintering in of a patch in the old one.

Melting Down

Delays in melting down can be partly eliminated if the furnace operators do not start to "push-down" until there is sufficient molten metal in the bath to envelope any remaining unmelted scrap that is pushed in. Most furnace helpers are anxious to have the heat melted as quickly as possible, especially when they are being paid on the tonnage basis and they think that, by pushing down as early as they can, they are speeding up the tapping of the heat. The reverse of this is true, for if there is not enough molten metal in the bath, the unmelted scrap will "freeze" the surface of the steel that has melted. This not only means that

*Engineer Westinghouse Electric & Mfg. Co., Pittsburgh.

more time is consumed in getting the bath molten again, but also that the refining of the heat will be delayed.

Excessive Power Demand

The power demand of an electric furnace is always greater at the melting down period than at any other time during the heat, and if the electrodes are allowed to surge with long reactionary rebounds, the greatest demand on power is being established. Hand control, for a period of from 10 to 15 min. after "power-on" has been used as a precaution against the conditions causing a peak load, but this experiment is not the solution, as the personal equation is the most important factor to be considered, and if the furnace operator has been working a heat for an hour and a half or two hours at 4 or 5 o'clock on a summer morning, it is the natural temptation to "throw it on" automatic control and go outside to get "cooled off." A peak may be established before the operator comes back to the furnace again, and that little rest which the furnaceman is really entitled to may cost his employer considerably more than it was worth to either.

An electrical device is being installed on furnaces now that greatly lessens the danger of excessive power demands being established. This equipment, known as the automatic current regulator for electric arc furnaces with movable electrodes eliminates "hunting" by shortening the distance through which the electrodes travel, thus furnishing a more constant power and resulting in a shorter period for melting down.

Slag Formation

The selection of melting scrap, used even for the making of real high quality steel in the electric furnace, can be so carried out that it is unnecessary to slag off at any time during the heat. It should be remembered, though, that scrap containing alloys should not be stocked with straight carbon scrap unless the alloy is of such a character and of such a small quantity that it will be lost by oxidation during the melting of the heat.

A good oxidizing slag which, when it has served its purpose, may be changed over to a reducing slag by the addition of lime, fluorspar and coke breeze, may be made by adding about 120 lb. of lime to the charge when it has been melting down for 15 min. This amount is based on a 6-ton charge. Other quantities for other size charges should be used in proportion.

The oxidizing or first slag has thus had an opportunity to partially do its work before the heat has been entirely melted and the addition of a small quantity of fluorspar will very often thin the slag sufficiently to make it thoroughly efficient. Although the constituents of the oxidizing or black slag are fairly stable, they can be changed to form the reducing or white slag by the addition of lime, coke breeze and fluorspar in the proportions of 11, 4 and 5 in the order mentioned. These are standard amounts for a 6-ton charge and, although additional quantities may be necessary to form and hold a good reducing slag for a predetermined period of time according to the nature of the heat, they will be found reliable in most cases.

Refining

The stirring of the heat while under the reducing slag may be carried to excess if the necessary care is not taken to avoid the mixing of the slag and the steel. It should be remembered that a slag is formed on a heat of steel for the purpose of refining the steel by its absorption of gases and impurities in the bath, but if the stirring is too violent or performed too often, small particles of slag are liable to be forced into the bath and entrapped, thereby losing their usefulness on the surface of the bath and also resulting in slag enclosures in the finished product.

Stirring of the steel should be confined to gentle agitation of the bath so that small pockets of gases will unite and minute particles of slag and other impurities will combine. This increase in the volume of both causes them to be forced to the surface. Stirring of the slag should be a replacement or turning-over process, so carried out that a fresh surface contact of an oxidizing or reducing nature will be kept on the bath until refinement of the steel has taken place.

It has been generally conceded that a heat of first quality steel should be kept under the reducing slag for at least an hour, but this time limit is controlled by different melting conditions. Steel containing alloys of high segregating powers should be kept under the reducing slag for a sufficient length of time to insure a homogeneous mixture in the bath. A preliminary check analysis of the alloys in question will satisfy the operator when this condition exists.

Decarbonizing

Decarbonizing of a heat of high quality steel by an oxide of iron is injurious to the steel, even when carried on under ideal melting conditions. There are times, however, when existing conditions demand a quick reduction of carbon in order to save a heat, and in such cases it may be treated with iron ore, mill scale, cinder, or some other oxidizing agent, to get the desired carbon content, although the heat thus treated should not be considered a first quality heat of steel, and an analysis of the finished product will show that the oxygen, hydrogen and nitrogen contents are higher than if other means of reducing the carbon had been used.

Decarburizing a heat of electric furnace steel should be brought about by the use of a low carbon steel, melting (muck) bar, Swedish iron or Norway iron. Its addition to the heat will, in no way, lessen the quality of the steel unless highly oxidized material is used, and the time consumed by this method, to get the desired carbon content, is considerably shorter than by the oreing-down process.

Furnace capacity should not be overlooked when considering the use of scrap, however, as it takes considerably more scrap than an oxidizing agent to reduce a heat the same number of points of carbon. The evolving gases, when an oxide has been used, have a scouring effect on the side walls and roof of the furnace, and the adoption of this practice for decarbonizing will shorten the life of the refractories considerably.

Recarburizing

Little can be said of the means of saving time in the recarburizing of a heat, as most methods commonly used are fairly efficient, although some have advantages over others.

The use of pig iron, or preferably washed metal, is considered the most desirable way of raising the carbon when the capacity of the furnace will permit, since it has two advantages: The carbon is raised to the desired point or limit and the tonnage is increased by the metal addition. This method is more expensive from a raw material standpoint and for that reason the introduction of carbon in some other form is very often used and found reasonably satisfactory, especially when the charge is too high in the furnace to allow of any additional metal. Coke breeze is often used by shoveling it into the furnace and heating it into the bath, but the uncertainty of the results to be obtained from it causes the furnace operator to hesitate using it, when he desires to raise the carbon more than 0.20 to 0.25 per cent.

Use of Old Electrode Couplings

The use of scrap electrode couplings has been found to produce very good results. They may be thrown into the bath and allowed to float around until the

operator, by actual experience, thinks that sufficient carbon has been absorbed by the bath. They may be used over and over again and their use is recommended in many cases, as the couplings are of very little commercial value as scrap and their use in this way can be considered as a double saving.

The lowering of the electrodes into the bath is a practice also being used very widely to introduce carbon into a heat, but the amounts of carbon obtained vary so widely with different heats that the practice should be used with precaution. It has been the writer's experience to have as much carbon absorbed from the electrodes in 10 min. by one heat as was absorbed in 55 min. by another heat, the electrodes extending the same distance into the bath in each heat and both heats were under a white slag the same length of time.

Addition of Ferroalloys

The factors to be considered in the addition of ferroalloys are the time and manner of their addition by which maximum efficiency will be obtained.

Nickel should be added to any charge as soon as the heat is entirely melted, as its stableness is so pronounced that no loss will be experienced from oxidation and ample time will be given for its dissemination.

Ferrosilicon, being the least expensive of the commonly used alloys, may be added to the heat as soon as the white slag has been formed. It has been found good practice to divide the amount to be added into two equal parts when the desired silicon content in the finished product is to be 0.55 per cent or less, adding one part after the white slag has been formed and the other about 10 min. before tapping time. When the desired silicon content is to be greater than 0.55 per cent the division of the ferrosilicon should be so proportioned that the greater amount is added first, the amount increasing in proportion with an increase in the desired silicon content in the finished product.

Introducing Chromium and Vanadium

Ferrochromium, although not as free from oxidation as nickel, is fairly stable, and its addition in quantities up to 200 lb. for a 6-ton charge is considered safe in most cases when the heat has been under a white "falling" slag for half an hour. It may be added earlier if the finished product is to finish over 2 per cent chromium. The addition of a great quantity of finely divided chromium should be avoided, as some of it will be taken up by the slag and, if not detected by the usual green tint of a slag containing chromium, will not be recovered.

Ferromanganese oxidizes slowly and may be added in appreciable quantities as soon as a good white slag has been formed.

Ferrovandium, a very active alloy, should be added from 15 to 20 min. before tapping, and to get the greatest efficiency from its use, it should be inclosed in a perishable metal container of some sort and forced down into the center of the bath. This can be done by wiring the receptacle to the end of a stirring rod and forcing it down into the bath quickly. A heat should be under a white slag for at least 45 min. before adding ferrovandium.

The same practice should be followed in adding ferrotungsten to a heat of steel as is used in adding ferrovandium, with the exception that ferrotungsten can be added from 5 to 10 min. earlier than ferrovandium on account of their relative activities.

Breakage of Electrodes

Electrode breakage, like the improper addition of ferroalloys, is a double loss to the steel manufacturer. The broken electrodes are of small monetary scrap value, and production is held up while new electrodes

are being put into place. There are electrode breakages, of course, which are unavoidable, but if proper care is exercised when new electrodes are put into place the number of these delays will be greatly reduced. When an electrode is put into place it should be tightened until the efforts of two men will not cause it to tighten down any further. This is important for two reasons: First, if an electrode is not screwed down tightly, it will form an escape for electric current and cause a "hot-spot" to form, and second, the hot-spot will weaken the joint sufficiently to reduce its resistance to shock to such an extent that breakage will occur at that point. The joint compound used when placing a new electrode into place should be plastic enough to fill the obvious crevices and firm enough to prevent its being forced out of the joint when the electrodes are tightened together and the amount used on each joint should not exceed from 5 to 10 lb. for a 17-in. electrode, with an amount varying in proportion for other sizes of electrodes.

Another cause for electrode breakage is when the surging of the electrodes causes them to work out of alignment. This happens when the cast shoulder, fitting around the bus-bar, is jarred around on the bus-bar enough to shift the electrode out of plumb and in striking a cold charge, particularly of heavy stock, it hits a glancing blow which will weaken the electrode and in time will break it off. Breakages resulting from this cause happen as a rule only during the melting down period, and will rarely occur if a reasonably light melting scrap is used, but will happen fairly regularly when the charge is made up of mostly heavy scrap.

General Remarks

The excessive demands made on the electric furnace, until a short time ago, caused by erroneous information having been circulated by furnace salesmen, make it all the more important that each operation of the furnace be studied thoroughly with the point in view of obtaining standard operating data. Such information will help to place the electric furnace on the firm basis that it should be and will help to dispel the thoughts that are injurious to the industry from the minds of those not using electric furnaces at this time, but who may consider their purchase in the future.

The electric furnace, although not fulfilling all the requirements that were expected of it at first, compares favorably with other melting mediums used for the making of steel. It is now being used to produce all kinds of steel, and is rapidly coming into prominence for use in the foundry and for the making of high-grade tool steels. It is well adapted for melting of small amounts of ferroalloys and the recent installation of two furnaces of 35 tons capacity is proof that the tonnage from electric furnaces will steadily increase. This will be especially true if the power rates on electric current are reduced, with a consequent lowering of operating costs, since the kilowatt hours per ton of steel produced are reduced as the furnace capacity is increased.

It is reasonable to believe that, with the impending scarcity of natural gas and the increased rates for the now limited supply of same, the electric furnace will make more rapid strides to the front than it has made so far.

The War Department is to use the standards adopted by the American Engineering Standards Committee by order of the Secretary of War, who directs that the supply branches utilize the specifications through a technical committee which now exists.

A. H. P. Leuf, receiver for the General Utilities Co., 1326-30 Ogden Street, Philadelphia, has arranged for the sale of the property of the company, including machine tools and other equipment.

IMPROVED DRIVE TRAFFIC

I am Steel.

Buried I lie until called to be servant to man. . . . Borne to a city of industry, fires make me flow into many forms and busy shops transform me for a world of work. . . . I am cast, rolled, cut into a myriad tools and devices, each gifted with the soul of a craft. . . .

As forge, with heart of fire, I defy cold, melt, transmute, refine. . . . I am Vulcan. . . . As motor, alive with breath of flame, I give nature's force to man. I am Titan. . . . Empowered I drive traffic over land, sea, and air, turn the wheels of industry in field, mine, and factory. . . .

My tools cut vast timbers into useful shapes, bind structures to shelter mankind. . . . With me men plow and plant, garner and grind to feed a race, and women cut and sew to clothe the world. . . . As magnet I guide commerce on trackless seas. . . . I become pen and press -- through me man's thoughts pass to the world and posterity. . . .

I am hammer and anvil of the race, and forgings. . . . I arm states with ship, tank and gun; raze far cities, overturn dynasties, bring new eras. . . . I become bridge, train, vessel, skyscraper. . . . I am forged into factories, spun into railroads, woven into cities. . . .

. . . . I make man strong of arm, --

I AM FORGED INTO FACTORIES, SPUN

Hercules; swift of foot--Atalanta;
and miracle worker--Aladdin. I scoop
out harbors, span rivers, unite oceans,
move mountains and toss them into
the sea. . . .

... My arms--tireless, strong, skilled,
beyond dreaming--set men free. . .

... My power to serve is boundless,
for in me pulsates cosmic energy. . .

... In soldier hands I carve the road
to freedom, with the surgeon I cut
the way to health, with the work-
er I build civilizations. . .

... Wise artisans endow me with
creative power in automatic machines
in which age-old crafts made per-
fect become immortal. . .

... I take man's puny crafts one by one,
make them all vast enterprises. . .

... I am steel!

... Man is my master.

... I am his master servant.

... I await his command to create
new eras.

Henry David Hubbard.

INTO RAILROADS WOVEN INTO CITIES

How the Government Is Helping Business

Great Progress Made by Secretary Hoover and His Assistants in Improving Service—Commodity Divisions Created—Important Work of Bureaus

BY L. W. MOFFETT

NEVER in the history of the Republic has industry been in greater need of a guiding hand than at the dawn of 1922. Great processes of economic readjustments are spread throughout the universe. There is a vast ebb and flow of the tide of finance, industry, commerce, agriculture and politics. Much remains to be done to complete liquidation and deflation and to quiet political and social unrest. The United States is more nearly free from these disturbances than any other great nation, but necessarily is unable to escape their consequences. Trade cannot be conducted normally where great areas of the world are still in the throes of an abnormal situation, and industry of this country has expanded to such a degree that it must increase its export business constantly. This is true of all the big industries, and assuredly included iron and steel.

Tendency Toward Stabilization

But perturbed as conditions are, the tendency toward stabilization is progressively encouraging. No satisfactory attempt can be made to indicate what the new year may develop as to recuperation, yet students who have surveyed the situation are confident that prospects have grown considerably brighter. At the same time, it offers a challenge to the ingenuity of those constituting the fabric of business and all of its elements. The keynote to a solution is co-operation. Business, however, requires a chart to point the way to the new era which is approaching. Fortunately, aid is at the disposal of business in the strong hands of the Government and it is desirable that it realize this much more fully than it has in the past, for it has only partially recognized the fact. It is perhaps true that there has been closer association between business and the Government during the past year than at any previous peace-time period. The Government, fully aware of the necessity of giving aid and advice, is showing an exceptional readiness to bring about normal conditions and to assist every branch of business to launch out in greater proportions, both in the domestic and export field. With possibly a relatively unimportant exception here and there, this gratifying inclination is evident, from President Harding down throughout the Government.

The Department of Commerce

Partly because of its function, the Department of Commerce has been and is the outstanding branch of the Government to give aid to business. That department is charged, as Secretary of Commerce Herbert Hoover has said, under act of Congress and by virtue of the desire of the Federal Government, to be generally helpful with the stimulation of the distribution of commodities. The greatest reason, however, for the new and closer relations between the department and industry, for they are decidedly closer than ever, lies in the personality heading the department. Possessed of a remarkable native ability which has been developed through a vast experience acquired under varying conditions at many points of the world, Secretary Hoover—a name known in millions of households throughout the world—has vitalized the department until it has taken on entirely new and greater proportions. His mind has many sides. It reflects the systematization of the engineer, the grasp of a big industrial leader, the poise and imagination of a successful financier, and has the solicitude of a practical humanitarian. Indeed, he has been described as a combination of all of these. Back of it all is a ceaseless energy.

This picture indicates what may have been expected of him as head of the department. It explains why that department has been so widely advertised in the United States and abroad. Mr. Hoover has been and is doing things for American industry. He has a ready ear for representatives in all lines of activities in the country. His many conferences are made up of people who constitute the woof and warp of the nation. Among them are representatives of labor, manufacturing, engineering, trade associations, agriculture, transportation, the daily and trade press, finance, etc. Still, Mr. Hoover is just starting. He does not consider that the organization he heads is yet a "real Department of Commerce," for he says in his annual report that it is not.

Relation to Industry

What, then, is the relation of the Department of Commerce to industry, under its stimulated and growing activities, which Mr. Hoover thinks will not reach their highest efficiency until there is a "thorough reorganization and entire regrouping of the Federal functions bearing upon these functions." By this he meant the giving of service to the producers, manufacturers and distributors of commodities, the ability to provide economic interpretation of importance to the American public generally, and to stimulate American trade and the merchant marine.

Too little interpretation has been applied to the phrase "keep the Government out of business," in the opinion of Mr. Hoover. "There are many lines of business that need the co-operation and assistance of the Government," he has said.

Answers as to the relation mentioned are given best in the statements that have been made by Secretary Hoover, and accompanying expressions by the heads of the three branches of the department most closely associated with industry. These are the Bureaus of Foreign and Domestic Commerce, Standards and Census, of which the respective directors are Dr. Julius Klein, Dr. S. W. Stratton and William M. Stuart, each well qualified for his position.

It will be helpful to summarize the work of the department and these bureaus. The efforts of the department itself have been devoted to reorganization of expenditures, and those bureaus concerned with industry and trade, that they may become of more effective service to the community, as explained by Mr. Hoover.

Appropriations for Next Year

The total appropriations asked for all bureaus of the department and approved by Director of the Budget Charles G. Dawes, for the fiscal year 1923, actually amount to \$19,939,970, as against the higher estimates previously made. The decrease was possible despite an enlarged program by reason of a reduction of about \$1,000,000 in the expenses of the Bureau of the Census and savings in other directions. The results of the bureaus concerning industry and trade are in part indicated by the increase in volume of demand upon the department for helpful action or information. These demands have reached a rate of approximately 1600 each work day, or over 500,000 a year. This gives a vivid idea of what the department means to industry. Much better results are contemplated.

The most striking improvement in the Bureau of Foreign and Domestic Commerce consists of the creation of 14 new commodity divisions. This development was made possible by an appropriation of approximately \$250,000, which became available on July 1. Some of the money represents new funds and the re-

mainder money transferred from other activities.

The commodity divisions were created in order that the bureau could be equipped to furnish better service to basic American industries. Before the establishing of these special divisions the bureau had practically no industrial experts connected with its Washington office. The great majority of its personnel, both at home and abroad, consisted of men of more general economic training and experience.

The units of the bureau's organization which concentrate on the geographical phase of export business have also been enlarged and expanded. In place of the old former single European Division, which covered all of Europe, also Africa and Canada, two new divisions have been established, covering Eastern and Western Europe respectively. With the establishment of these two new divisions, the bureau now possesses five geographical divisions as follows:

Eastern European Division, Western European Division, Far Eastern Division, Latin American Division, Near East Division.

Geographical Divisions

The geographical divisions supervise and attend to the preparation of reports and replies from interested American business men from the geographical point of view. This work will often supplement the more specialized commodity service performed in a like manner by the commodity divisions. The commodity and geographical divisions work in the closest harmony in furnishing maximum service to American business from both angles.

Two new divisions of a different character from either commodity or geographical divisions have also been established. They are: Commercial Laws and Transportation.

The Division of Commercial Laws collects and compiles information with regard to the laws of foreign countries which affect the transaction of American business within the borders of such countries. At the present moment, this division is planning a world-wide survey of the commercial laws of foreign countries on a scale conservatively estimated to be far greater than has ever been attempted by a Government agency. With the help of the commercial attachés, trade commissioners and consular officers, this division will shortly can-

vass the world for information on which to base numerous special booklets.

The Division of Transportation will study problems connected with the movement of freight, both by land and by sea, in an effort to be of assistance to American exporters in solving difficult problems of this kind, and in expediting the movement of American goods to foreign ports.

In line with the general reorganization mentioned, the old familiar daily *Commerce Reports*, known for years to practically every exporting firm in this country and in many foreign lands, has also felt the force of the tidal wave of better service. *Commerce Reports* is now published weekly instead of daily. The new *Commerce Reports* is conveniently arranged and classified by subjects with commodity sections to correspond with the bureau's new commodity divisions. It contains special sections devoted to the work of the Division of Commercial Laws and the Division of Transportation. Each issue

also contains a section devoted to each geographical division. The new weekly, in addition, contains at least one page of "Foreign Trade Opportunities," indicating specific openings to sell American goods. It also refers to available lists of foreign dealers, importers, and other prospective buyers of American merchandise.

Assistant Directors

To take care of the greatly increased administrative work connected with the expansion of the bureau's services, Congress has provided for four assistant directors in place of the two employed heretofore.

In connection with the older units of the bureau's organization, the Research Division plans to improve both the scope and character of the very necessary research work which it performed. There is also the bureau's Foreign Tariff Division. It is planned to improve the services rendered by this division in the supplying of technical and often complicated information regarding foreign tariffs, consular regulations, patent and trade-mark matters, rules governing commercial travelers and their samples in foreign countries, etc.

Commercial Intelligence

Another comparatively new section in the bureau's organization is the Division of Commercial Intelligence. This division is charged with the responsibility of pre-

paring trade lists. The new lists represent a vast improvement over the lists formerly furnished by the bureau. The new lists go about as far as a Government office can go in furnishing details regarding foreign firms. They will show the relative size in each community of each firm listed. They will also indicate the character of the business of each firm.

The bureau has asked in the appropriations sought to continue the 14 commodity divisions already organized and to establish 16 additional ones. These 16 which are proposed would deal with non-ferrous metals,

effect certain reforms, is to ask business what the Government can do to help it in its problems.

Of the commodity divisions set up those of most interest to the iron and steel and machinery trades relate to those lines. The practical experience of Mr. Becker, chief of the Iron and Steel Division, and of Mr. Rastall, chief of the Heavy Machinery Division, has been reviewed by THE IRON AGE so that its readers are acquainted with their past work. The operation of their divisions also has been described previously, but supplemental comment by Mr. Becker reflects further the result of work being done by the iron and steel division and efforts under way.

Mr. Becker's Work

Mr. Becker feels much encouraged over the ready response his division has met with from the various factors in the iron and steel industry engaged in foreign trade. Some of the trade associations and organizations affiliated with the industry have voluntarily established contact with the division, with the desire of co-operating with it to the fullest extent.

"The Iron and Steel Division is young and has only started in its endeavor to be of service to the interested manufacturers and exporters, and has laid plans, which for their successful execution will require the advice and suggestions of manufacturers and exporters who have had long years of experience in the problems encountered in foreign trade, and the support of every branch of the industry," said Mr. Becker.

"The plan and scope of the Iron and Steel Division embrace the following:

"It is proposed to render assistance to the American manufacturers and exporters of iron and steel in not only protecting and maintaining their share of the world's trade, but in finding new fields and opportunities to provide an outlet for the increased capacity of the steel mills as a result of the war; to bring the exporters in direct contact with foreign markets and buyers; and to act as a clearing house for foreign trade information.

"Questionnaires have been prepared by the division for these field men, in which the kind of information desired for the American exporters is outlined in concise but comprehensive form. A list of the commodities covered by the division accompanies the questionnaire, as well as complete specifications of many of them to guide the investigator who may have little knowledge of the marketing of steel products. Suggestions are also made as to where to look for reliable and accurate information. It is desired to secure complete and accurate information, leaving no room for conjecture on the part of the division when interpreting the mass of statistics received. Special investigations will be undertaken in certain sections of the world by men particularly fitted for work of this character. The reports coming to the division from these men will be of special value to the exporters of steel, because they will depict the situation, with respect to a definite trade or industrial center, in complete, accurate and up-to-date form. Foreign periodicals received by the bureau from every part of the world and in a great variety of languages form another source of information for the division.

"Information is being received in the division in increasing quantities, and the problem is to determine how best to utilize it for the best interests of those it is intended to serve. The bureau's weekly *Commerce Reports* is one of the several channels used to disseminate information; another very important medium used is the trade and daily press. Information relating to some definite foreign project or business, in which a certain branch of the industry only is interested, is distributed directly by letter to those firms particularly concerned; confidential and reserve information is sent out in a special circular to those American firms recorded on the bureau's exporters' index. Material not used for distribution is placed on file, where it is available for use in providing answers to the many inquiries being received from those interested or engaged in foreign trade. Co-operation with other divisions of the bureau enables the Iron and Steel Division greatly to supplement its service to the American exporters of iron and steel."

Vitalized Department of Commerce in Brief

Reversing the usual Government order, the department is reorganized on a basis of asking business its needs and then devising practical plans of service.

Efficiency and economy relating to all lines, raw materials, skill in manufacture, labor, and capital underlie the principle for maintaining home markets and developing foreign trade to take care of expanded production.

Restoration and continuance of prosperity is sought by stabilization of industry by wiping out removable fluctuations with their peaks and valleys of trade conditions.

Elimination of waste and sensible policy of standardization instituted, calling for proper methods of production.

Commodity divisions supplemented by others in transportation, commercial law, set up in Bureau of Foreign and Domestic Commerce, with specialists in charge of supplying industry with facts and studies of intimate and vital character. Co-operation with business interests has been extremely close with resulting benefit both to them and the department, co-ordination of interest of all being effected and interdependence of one branch of endeavor on others being developed.

It is also the purpose to develop collective efficiency of American business men, which Mr. Hoover thinks is not so high as their individual efficiency.

Through co-operation with trade associations, trade papers and other sources, the Bureau of the Census publishes vital statistics monthly under the supervision of Dr. F. M. Surface, giving a picture of business conditions and market trend and affording interpretation of future conditions.

The Department of Commerce itself publishes "Commerce Reports" weekly, material being assembled from all parts of the world and grouped according to commodities and other subjects of importance to business.

The splendid service of the Bureau of Standards is receiving increased recognition by industry in consequence of which its work is being broadened.

hardware and tools, petroleum, vegetable oils and lead stuffs, meat and dairy products, canned goods, cotton and cotton goods, wool and woolen goods, dyes and drugs, heavy chemicals, paints and varnishes and tanning materials, glass and earthenware, paper, foreign investments, advertising, packing and credit methods, and maps and commercial geographies.

Closely related to the commodity divisions is the division on standardization and elimination of waste, recently set up under the general direction of the Department of Commerce. This division is headed by William A. Durgin, for several years public utility expert for the Commonwealth Edison Co., Chicago, whose activities with that company were similar to those now devoted to the department and industry generally. Mr. Hoover has made it clear that the policy of the division, instead of being to order industry to put into

Of great aid to the commodity division chiefs are the commercial attachés and trade commissioners, whose reports have become of a more specialized character and more interpretative than heretofore, and consequently are more important to industry and trade.

The plans of the Bureau of Foreign and Domestic Commerce are to increase the personnel of attachés and trade commissioners. It is proposed to increase the number of attachés from 18 to 15. They would be established for the first time at Havana and Stockholm. Offices already established would be continued at Berlin, Buenos Aires, Copenhagen, London, Madrid, Mexico City, Paris, Peking, Rio de Janeiro, Rome, Tokyo and Santiago, Chile. One commercial attaché would be appointed at large. The estimate provides for 32 trade commissioners, instead of 18, as at present, and nine assistant trade commissioners, instead of five, as at present.

The Inter-American High Commission was transferred in December from the Treasury to the Bureau of Foreign and Domestic Commerce and Secretary Hoover made chairman of the United States section. The commission is established by treaty with all South American countries and its purpose is to act in common as an advisory body to the various governments in perfecting commercial and financial practices between the different countries.

Bureau of Standards

Ranking among the foremost Government organizations of vital importance to industry is the Bureau of Standards, whose director, Dr. Stratton, has been paid a remarkable tribute by a remarkable man. Thomas A. Edison has classed Dr. Stratton as being 100 per cent efficient. If it is humanly possible to attain such a high standing, it is easy to understand why the rating was given Dr. Stratton. His record reflects the greatest excellence of a man of science. In turn this proficiency is evident throughout the bureau, which is located high on the outskirts of Washington in an appropriate atmosphere of quiet that is conducive to painstaking research and study. Its duties and performances are manifold and its accomplishments are vast. Its functions, as its literature points out, relate to development, construction, custody and maintenance of reference and working standards and their intercomparison, improvement and application in science, engineering, industry and commerce. There is no scientific and technical problem within its wide range that it will not handle, dissect, analyze and work out to the minutest detail. Working standards involving balances ranging from that capable of measuring the thousandth part of a milligram to the large testing machine capable of measuring a load of thousands of tons all come within its purview merely as a fractional part of its work. Engineering students, as well as engineers, business men and many others in miscellaneous walks of life from the United States and foreign countries, are shown through the testing laboratories, seeking and obtaining invaluable information.

The Bureau and Industries

Dr Stratton further explains the relation of the bureau to industries as follows:

"Every one in the United States and particularly our industries are today showing much more interest in the work of the various departments and bureaus of the Government than was the case a few years ago. This is as it should be, and even where the interest is only a desire on the part of some one to increase in a general way the economy and efficiency of Government operation, such an interest is a good thing. With our industries, however, the underlying reason for this getting together of commercial concerns and the Government is more direct and of even greater importance. Industrial concerns have discovered that real service in the shape of good, practical advice can be obtained from the Government, and that this advice will often lead to greater production and increased dividends. Not long ago many manufacturers were unwilling to admit that a Government institution could tell them anything about their particular work.

"The Bureau of Standards of the Department of

Commerce has been a pioneer in this work of bringing together the Government and the industries.

"An investigation apparently of interest only from the point of view of pure science will yield results of untold value to several industries. Numerous examples might be given to prove this point, but it is sufficient to say that even pure scientific research work is well worth the hearty support of our industries, for

Dramatic Year in Foreign Trade

BY DR. JULIUS KLEIN,

Director Bureau of Foreign and Domestic Commerce

"The year which has just closed was without doubt one of the most dramatic in the entire history of the foreign trade of the United States. It has now gone beyond, however, and in the words of Secretary Hoover, 'just as 1921 was the year of liquidation, so 1922 will be the year of restoration.' Careful surveys of foreign fields show unmistakable signs of certain, if slow, improvement. They show also that there is nothing radically wrong with American export trade to-day. The principles of rational merchandising are the same at this moment as before the war. There is no fundamental cause for despondency, but there is a great deal of need for the exercise of prudence and shrewdness. To expedite rapid recovery, there must, of course, be evidence of a greater amount of care in planning sales programs coupled with a thorough understanding of the principles of economic production.

"Fortunately the coming difficult period of 'business restoration' finds the Bureau of Foreign and Domestic Commerce far better equipped than ever before to render essential service to American industries. For the first time in the bureau's history, it is now in a position to get at the heart of America's great export industries, The 'No-Man's Land' of official trade generalities has been crossed. From this time on, the coming together of business and Government for the purpose of trade promotion will be characterized on the part of the Government by an intelligent understanding and appreciation of the needs of business—not alone of its more general requirements, but also of the puzzling details and bewildering individual twists and turns which may be peculiar to each trade.

"This vastly improved and vitally necessary official trade service has come as the result of the creation of 14 special commodity divisions. The men in charge were selected with the help and upon the recommendations of the industries to be served.

"These new services were created for the special benefit of American industries and their facilities are at the complete disposal of all American manufacturers. They are in working order now and are being used to advantage by many American business men. A most cordial invitation is extended to the readers of THE IRON AGE to call upon the commodity divisions or any other service of the Department of Commerce for advice and assistance in connection with any matter related to trade promotion. No problem, no firm or no individual is considered too large or too small."

no one of them can tell when they may be recipients of highly important information of direct bearing on their own particular production process.

"Another kind of research work is that conducted with the object of solving some particular problem and is the type more often carried out in industrial laboratories. This work at the Bureau of Standards was prosecuted with great vigor particularly during

the war. The difficulty and in some cases the impossibility of securing certain materials and appliances from abroad made necessary the development of similar things in this country.

"When the manufacturers were virtually forced into unfamiliar lines of work, they turned to such institutions as the Bureau of Standards for the fundamental information which is always absolutely essential in starting any new production process. As a result of the war, very close co-operation now exists between the bureau and many of the foremost industries of the country.

"This is particularly true in the case of metallurgical work which may be taken as an example of the industrial research work of the bureau. Realizing the great importance of scientific investigation in this field, the bureau has provided a special division to care for such problems. Its laboratory is the best equipped in the world for general research work on both ferrous and nonferrous metals and alloys. As in several other lines, the bureau realizes that only by the study of actual manufacturing processes can real improvements be made. For this reason the equipment of the division includes a small experimental foundry, rolling mill, many different types of furnaces, a forging press, draw bench, etc., so that the actual processes conducted in a commercial plant can be studied on a small scale.

"The members of the bureau's scientific staff serve on many committees of manufacturers and industrial associations and through the contact thus established, the industries of the country are kept in close touch with the fundamental research work in progress at the bureau. Practically all the industries now realize the value of an unprejudiced general research organization which can take up those difficult and fundamental problems which are of interest to an entire industry rather than to the individual manufacturer.

"Through a system of research fellowships, which has now been in operation for some time, industrial organizations can send to the bureau a representative to work upon particular problems of interest to that industry. This research fellow is given the use of the bureau's laboratories and the advantage of association with the bureau's scientific staff. The funds for the development work are provided by the organization which sends the representative, and it is stipulated that the results are to be used as the bureau sees fit for the benefit of the industry as a whole. Advantage has been taken of this arrangement by numerous manufacturing concerns and industrial associations.

"A great opportunity exists for standardization in sizes and production methods, and the bureau has already done valuable work in this field. However, a start has hardly been made in comparison with what might be done in this as in other lines of industrial standardization.

"In closing, it should be pointed out that this important need for industrial research by such institutions as the Bureau of Standards can be met only if the bureau is granted the hearty support of all our industries. The work in some lines has only recently been started and in others has not even been commenced. The next few years ought to witness a steady growth in this class of research work, and it is to the interest of every manufacturer to further such a development, as upon scientific research of this sort will depend the future success of our industries."

"Probably few persons," said Director Steuart, "other than those connected with the census realize the magnitude of this undertaking and the difficulties of carrying it to completion within the three year period prescribed by law. It involves the printing and distribution of 25,000,000 schedules of questions; the organization and supervision of a force of over 90,000 enumerators and special agents employed to make a house-to-house canvass of the entire United States—including all the outlying possessions except the Philippines and the Virgin Islands—and to fill out schedules for 107,500,000 people, 6,500,000 farms, 450,000 manufacturing establishments, and 22,000 mining and quarrying enterprises; the examination, checking, and editing of the schedules when received; the punch-

ing of 300,000,000 tabulation cards; the running of the equivalent of over 2,500,000,000 cards through electrical sorting and tabulating machines; the computation of about half a million percentages, averages, and other rates; the preparation of elaborate manuscript tables; and, finally, the printing and publication of 12 or more quarto volumes averaging about 1000 pages each."

"Believing that there thus exist a great opportunity and a great need for the adequate analysis and interpretation of census figures and their application to the live questions of the day, the bureau, acting upon the earnest recommendation of the advisory committee, plans to prepare and publish, after the close of the decennial census period (June 30, 1922) a series of interpretative special studies or monographs on various subjects within the scope of the census; and I believe that this project, if it can be successfully carried out so as to realize or approach the standard of excellence which we hope to attain, will greatly increase the value and utility of the census to the public," Director Steuart says. The bureau is now publishing interesting industrial statistical data in its "Survey of Current Business," a new enterprise that has been well received.

The bureau's work is conducted by a staff of 850 employees, housed in 13 laboratory buildings. It has a technical library of nearly 22,000 volumes, and a range of subjects and variety of equipment unique in research laboratories. The research results are made available to the industries through the Bureau's publications, of which nearly 800 have been issued. During the fiscal year the bureau issued 86 new publications, comprising 33 scientific papers, 27 technologic papers, 18 circulars, 3 handbooks, and 5 miscellaneous publications. A technical news bulletin, issued each month, describes current investigations in progress and results obtained in the laboratories.

Cost of Operation

This sketch of the activities of the Bureau of Standards, although inadequate, gives a bird's-eye view of its work. And for all the splendid service it gives and offers to industry, its cost of operation is absurdly small. For the fiscal year of 1923, its estimates carried in the budget total only \$1,762,560, as compared with an appropriation of \$1,570,360, and \$1,847,560 requested. Of the estimates \$40,000 is for metallurgical research, the same is allowed in existing appropriations, but \$10,000 less than was asked for 1923.

It is all too common for the work of constructive Government agencies to be misunderstood and insufficiently appreciated. Despite the fact that its duties require it to get into touch with every institution and family in the United States and its possessions, comparatively little is known of the functions of the Bureau of Census and their vital bearing on industry and all other activities of the broad sweep of life it affects.

During the fiscal year ended June 30, 1921, the second of the three years constituting the decennial census period, the bureau completed the field work of the census, brought well toward completion the tabulation of the results, and published a considerable part of the statistics in bulletin form. The preliminary announcement of the total population of the United States was issued on Oct. 7, 1920. State bulletins on population, agriculture, manufactures, and other subjects covered by the census are being published and in addition, thousands of press summaries have been prepared and sent out. Thus the information collected for the fourteenth census has been given to the public with the least possible loss of time, and a very considerable part of it will have been made available for use long before the publication of the last of the bound volumes constituting the final reports.

This brings to a close an attempt to outline the relation of the Department of Commerce to industry. It comprehends only a part of such a big subject. But it is hoped it will bring about a greater realization of its value and increase cooperation, so greatly stimulated during the past year. It surely must be appreciated that industry is offered splendid returns on an annual investment of approximately \$20,000,000. It will indicate that the department is a safe guide to greater things for industry.

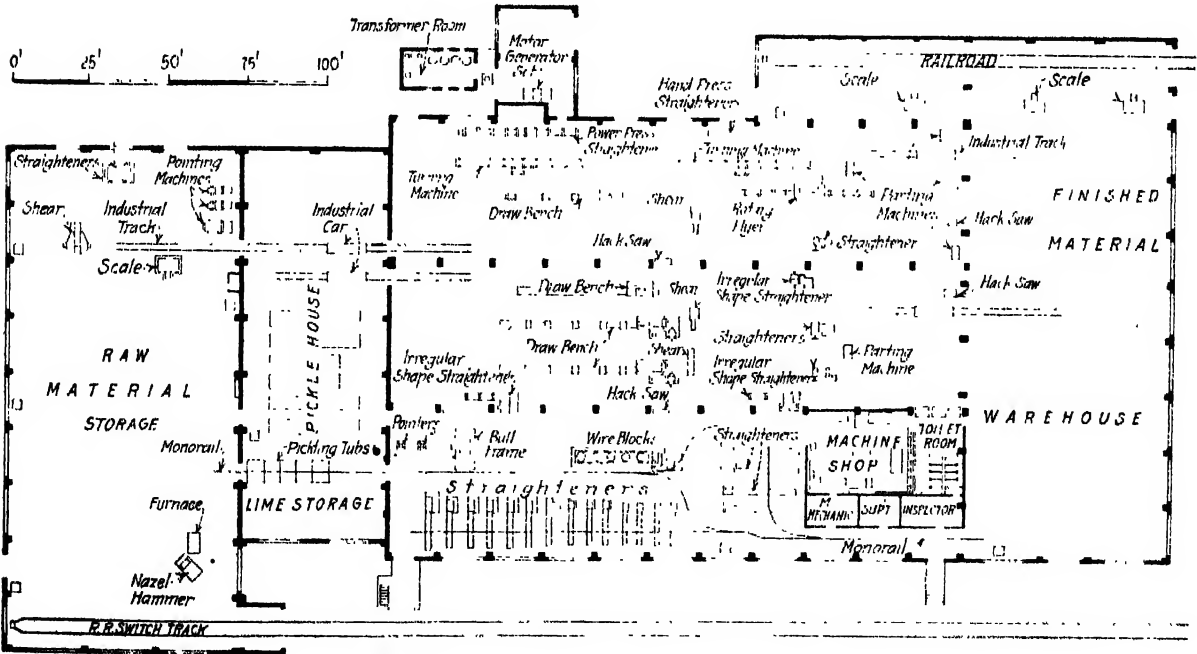

LaSalle Co. Completes Cold Drawing Plant

Designed for Handling Products in Maximum Lengths—Raw
Material Protected from Elements—Plan
Anticipates Expansion

BY GILBERT L. LACHER

QUANTITY, rather than quantity production, is the main desideratum in a plant manufacturing cold drawn steel bars and shafting. Maximum output is important in the sense that economy in operation is the aim of every manufacturer, but the necessity of producing material which will pass the rigid specifications imposed on cold finished steel demands more than usual care in the handling of material in process and in the inspection of a finished product. The recently completed plant of the LaSalle Steel Co., at Hammond, Ind., was designed and is being operated with heed for these considerations. The plant layout is such that the

progress of the product is uninterrupted from the raw material to the finishing ends. A large warehouse has been provided for incoming raw material, to protect it from the elements. Railroad sidings enter both the raw and finished material warehouses, thereby facilitating the movement of both incoming and outgoing products. The plant site comprises 35 acres and one side of the main building is constructed of hollow tile, so that all of the departments, or any one of them, may be extended as the future needs of the business may require. The plant was designed and equipped to handle material in maximum practicable lengths, bars up to 41 ft.

In the Layout of the Plant, Provision Is Made for "Straight-Line" Routing of Material, from the Raw Material Storage at Left, Through Pickling Vats and Draw Benches, to Finished Material Warehouse at Right

long being drawn and finished. Special attention has been given to the inspection of material, both in the process of manufacture and in the finished state.

The LaSalle plant consists of three buildings, a boiler house, 50 x 57 ft.; an annealing and heat treating department, 60 x 80 ft., containing a furnace of 25-ton capacity; and the main structure. The latter comprises raw material warehouse, pickling room, manufacturing department and finished material warehouse. This building, which is approximately 175 x 445 ft., contains 77,875 sq. ft. of floor space. It is built of structural steel, with an exterior of brick on all sides except that to which extensions are expected to be made. Continuous sash on the sides and in the roof monitors insure ample light in all parts of the plant.

All raw material is stored under cover in a warehouse, located at the end of the building farthest from the railroads adjacent to the property. A railroad siding enters one end of the warehouse, and here material is lifted out by a 10-ton Northern Engineering

used by the sample weight. Some of the coil stock is pointed in the warehouse before passing on to the other departments. This work is done on a motor-driven hammer, furnished by the Nazel Engineering & Machine Works, Philadelphia. Previous to pointing, the material is generally heated in a Strong, Carlisle & Hammond Co. oil furnace. This precaution is taken to prevent brittleness, which sometimes results from hammering. For the straight bar stock, three pointers have been provided, which will handle rounds up to 2½ in. Other equipment in the raw material warehouse includes a 5-ton dial scale furnished by the American Kron Scale Co., New York; a shear which will cut material up to 3 in. in cross section, manufactured by Doelger & Kirsten, Milwaukee, and a rotary straightener built by the Abramsen Engineering Co., Pittsburgh, through which all stock to be turned is passed before going on to the other departments.

Straight bar stock and coils are handled separately, from the raw material warehouse through the inter-

In the Pickle House Are Two Departments, for Coils and Straight Bars, Respectively. The coil tubs are served by overhead monorail, as shown, while the long vats, two of which appear in the immediate foreground, are served by overhead traveling crane

Works overhead electric traveling crane, by which it is distributed throughout the room. The crane drum from which the steel is suspended was made longer than usual, about 15 ft. in this case, to prevent swaying in the long bars handled. In this connection it is to be noted that raw material is ordered in maximum lengths which freight cars will permit—up to 40 ft.; at the request of the LaSalle company, cars are loaded by the mills in 5-ton lifts. Material is thence distributed in the warehouse in 5-ton bundles, and throughout the process of manufacture an effort is made to handle material in these units; four, five or six lifts of 5 tons each at a time. This method eliminates frequent weighing, which would otherwise be necessary in handling steel against specific orders, and facilitates the checking of the progress of material throughout the plant.

Material of small cross section is handled in coils, rather than in straight bar form. After the weights of a few representative coils out of the same shipment have been ascertained, a fairly accurate estimate of an order may be made by multiplying the number of coils

vening departments to the finished material warehouse. For handling the coils a monorail system equipped with four 2-ton hoists furnished by the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., has been provided. Three of these hoists are operated from suspended carriages; the fourth, in the pickle room, is controlled from the floor, because of the fumes rising from the pickling vats.

Straight bar stock is handled throughout the plant by overhead traveling crane (within each department) and industrial truck (from department to department). As the movement of stock from the raw material storage is all in one direction, the industrial tracks are laid on a slight grade, so that only a light pressure is required to set the industrial car in motion. These cars, designed by the company's engineers, are long, flat, narrow gage equipment, suitable for handling long bars.

Adjacent to the raw material warehouse, the pickle house consists of two departments, one for coils and the other for straight bar stock. The coil tubs—three for

Two of the Draw Benches Are Equipped with Pushers Which Point the Stock Before It Is Drawn. Thus Eliminating Necessity of Using Separate Pointing Machines. One of these benches appears here

acid, one for water and one for lime—are located directly under the path of the monorail hoist. The tubs are made of wood and set in concrete depressions in the floor. Six long wooden vats, commanded by a 5-ton Northern overhead electric traveling crane, have been provided for straight bar stock. Of these, one contains water, one lime, and four acid. Four of these vats are 41 ft. in length, while two of the acid tanks are 32 ft. only.

The company considers pickling the most important step in its process of manufacture, and has a chemical engineer in charge who is responsible for the practice employed. The aim is to secure a complete removal of all scale from the steel without permitting the acid to eat into the surface, and at the same time to obtain a thorough removal of the acid subsequent to pickling, without incurring bad after-effects, such as brittleness. The steel is pickled, in a solution of sulphuric acid and an undisclosed compound, for from 30 to 45 min., after which it is placed for brief periods in the hot water and lime vats. The coating of lime serves as a lubricant during the subsequent drawing of the steel.

Three parallel bays, two for straight bar stocks, and one for coils, house the manufacturing department. The equipment for handling straight bars includes two turning machines and four draw benches. Both turning machines, one of which is a 4-in. and the other a 6-in. machine, are equipped with one roughing and one finishing tool, and have beds which will handle bars up to 40 ft. long. Adjacent to these machines is a power press straightener, which will take rounds up to 6 in. in diameter, and a hand press straightener which is held in reserve for any overflow in production. The material is put through the power press straightener before turning, this being the second straightening to which the stock is subjected, the first being in the raw material warehouse.

After turning, the material is passed through a 6-in. rotary flyer for straightening and polishing. The rotary flyer takes out all sweeps in the bars, but as an added precaution, to remove any slight kinks not visible to the eye, all shafting is again passed through the power press straightener before going to the parting machine. Finished shafting is run through parting

To Straighten and Polish Material After It Has Passed Through the Turning Machines, This 6-In. Rotary Flyer Uses Wood Polishing Blocks, Fastened in the Projection Shown at Right End of the Machine. The heavy rollers in the frame do the straightening as the frame revolves at high speed

machines, to prevent the distortion which might result from shearing. Some screw machine stock too large for shearing is also put through parting machines. The plant has five of these machines altogether, ranging in capacity from 1½ to 6-in. rounds. They were made by the Hurlbut, Rogers Machinery Co., South Sudbury, Mass., but certain modifications in their operation have been made by the LaSalle engineering staff. For shearing screw machine stock, three Doelger & Kirsten shears with capacity up to 3 in. have been provided.

Of the four draw benches, two will handle material up to 42 ft. in length, and the other two up to 80 ft. The two long machines have pushers which point the stock before it is drawn, thereby eliminating the necessity of the use of separate pointing machines. It is planned also to fit the smaller benches with pushers. A feature of the drawing equipment is its flexibility. All of the benches may be used for drawing irregular shapes, as well as rounds, and three are fitted for multiple drawing. Each bench is equipped with delivery arms, which raise the material after it has been drawn and drop it on adjacent horses, which carry rollers to facilitate the handling of the steel. Each bench is served with a round straightening machine, built by the Medart Pulley Co., St. Louis, and in addition there are three irregular shape straighteners, supplied by the F. B. Shuster Co., New Haven, Conn. For cutting irregular shapes four hacksaw machines have been provided.

In the coil bay, larger gage stock is drawn through a double-drum bull frame, built by the Morgan Construction Co., Worcester, Mass. This machine will draw material up to 1 in. in diameter, one drum being arranged for drawing shapes and both drums for drawing rounds. Pointing for this machine may be done either in the raw material warehouse or on two pointers located in the coil bay near the entrance to the pickling department. For drawing sizes smaller than ½-in. four wire blocks, equipped with roll pointers, have been provided. Twelve Shuster straighteners, in a row, finish bars up to 12 ft., which is the ordinary length for screw machine work. In addition, two Shuster straighteners are used to finish bars from 14 to 24 ft. in length. Driven from line shafting, these straighteners automatically straighten, polish, and cut material to length in diameters ranging from ¼ to ¾ in.

In one corner of the manufacturing department is a machine shop, where all dies are made and repair work and modifications and changes in the equipment are handled. The company also does its own carpentry and electrical work, aiming to be as self-contained as possible. The draw benches, the turning machines, the rotary flyer, the irregular shape straighteners, and the monorail system are operated by d.c. motors. All of the manufacturing units, except the Shuster round straighteners, are driven by individual motors. Current, bought from the Northern Indiana Gas & Electric Co., is stepped down from 10,000 volts a.c. to 440 volts.

There are five Northern overhead electric traveling cranes, one of 10 tons in the raw material storage, and 5-ton cranes in the pickle house, the finished material warehouse and in two of the three manufacturing bays. All cranes are capable of taking an overload of 25 to 50 per cent. All are equipped with long cable drums, similar to the one in the raw material storage previously described, except that in the manufacturing bays the drums are at right angles to the bridge of the crane, the purpose being to keep the drum parallel to the material handled.

After material has been finished in the manufacturing department it is thoroughly sprayed with a flushing oil, free from acid and containing as small a percentage of moisture as possible. It is then transferred to the finished material warehouse. The joint storage capacity of the raw and finished material warehouse is 18,000 tons, and the manufacturing capacity of the plant is 6,000 tons a month. The output divides itself into two classifications, screw machine stock and shafting. For the former it is unnecessary that material be delivered in specific lengths. Orders for shafting, however, specify the length as well as the diameter of the stock. As an aid to the flexibility of the shipping department, shafting is ordinarily carried in lengths of 40 ft., which is a multiple of most of the sizes likely to be specified.

In the operation of the LaSalle plant, the works superintendent has no control over the finished material warehouse. The purpose of this division of authority is to prevent the head of the manufacturing department, who is naturally interested in the maximum output at minimum cost, to ship out any material not strictly up to specifications. The head of the shipping department is held responsible for all material leaving

Four Wire Blocks Equipped with Roll Pointers, Shown in Right Foreground, Are Used to Draw Steel in Sizes Smaller Than ½ In. Diameter. Behind them is a battery of twelve straighteners

Coil Stock of Larger Cross Section Is Drawn Through a Double-Drum Morgan Bull Frame, Which Will Handle Material Up to 1 In. in Diameter. Both drums are arranged for drawing rounds, and one for drawing shapes

his hands, and to this end is authorized to turn back to the manufacturing department all steel which does not pass his inspection. Frequent inspection is also required throughout all of the previous operations. Material is not permitted to pass from one department to another if it does not meet specifications. The effectiveness of inspection is probably to be attributed to the employment of a cost system, of which it is an incident.

As previously indicated, work is put through the plant in lots which are multiples of 5 tons. To facilitate this procedure a production order is made out in multiple, the office copy of which shows the amount of raw material to be used in terms of pounds, number of bars, size, shape, length, etc., the finished material to be made, in the same terms, and the specific orders against which the finished product is to be applied. Each production order is numbered, and the date on which it is sent out is registered on the office copy, and also on the raw material requisition which goes to the raw material warehouse. Copies of the order are attached, for each department through which the material will pass. On these copies are provided spaces for the insertion of the name of the foreman handling the work, the time required to perform the operation, the number of men employed on the job and the date on which the work is completed.

Before a department head will accept a production order, however, he inspects the material delivered, and in case it does not meet specifications, turns it back to the previous department. As soon as an operation is completed and material is passed on to a succeeding department, the copy of the production order showing the work completed, is returned to the office. This practice not only gives the management an accurate check on costs as compared with the previous costs for similar operations, but also enables it to keep track continuously of material in process. Separate copies of each production order go to the raw material warehouse, the pickle house, the pointing machines, the turning or drawing departments, the straightening machines, the cutting department and the shipping department.

The LaSalle plant has the advantage of excellent railroad facilities. Its sidings connect with the Pennsylvania Railroad and with two belt lines, the Elgin, Joliet & Eastern, and the Indiana Harbor Belt. The plant is only four miles from a large transfer yard at Gibson, Ind. One of the two switch backs serving the plant enters the shipping department, where box cars are spotted for loading. Raw material is weighed before shipment, three 5-ton Krone scales being located at convenient points on the shipping platform.

RATE INVESTIGATION

Cost of Production of Iron and Steel Products Will Be Involved

WASHINGTON, Jan. 3.—The bearing of present freight rates on the cost of production of iron and steel products and their effect on the market, together with a large volume of other facts, will be brought out in the course of hearings before the Interstate Commerce Commission when it resumes proceedings in the general rate investigation case. The date has been postponed from Jan. 9 to Jan. 11. From Jan. 11 to Jan. 18 the time will be devoted to direct testimony of the carriers and cross examination of their witnesses.

Then follows the presentation of the side of the shippers to be opened with subjects concerning the iron and steel industry. On Jan. 19-20 the coal and coke situation will be submitted, while on Jan. 21-23 the hearing will deal with ore, furnace materials, and iron and steel products. This gives representatives of the industry four days to present their views and they

are said to be prepared to submit a wealth of figures and observations as to the effect present high rates have on the industry, the absolute necessity of reducing them, and to go into the question of relationship of raw materials to manufactured products. This latter, however, is a subject of disagreement among rate authorities and opposing views have been expressed by representatives of the industry itself. The latest demonstration of this was in connection with informal conferences before members of the commission by Lake front iron and steel and interior iron and steel producers. The fact that the commission, as the upshot of these conferences, restored iron ore rates from Lake Erie ports to their previous high level, effective Jan. 1, has led some to think it takes the attitude that there is a direct relationship between rates on raw materials assembled to produce pig iron. This position is taken by reason of the fact that the Lake front manufacturers claimed it was discriminatory against them to permit interior furnaces to enjoy reduced rates on iron ore without allowing lower rates on coal and coke to Lake front plants. At the same time formal opinions of the commission have been handed down which do not uphold this theory.

Electrolytic Iron a Commercial Product

The Eustis Process Compared with Others—An Ore Instead of Scrap as the Anode—Tests and Properties —Fields of Usefulness

BY BRADLEY STOUGHTON*

FOR more than 50 years attempts have been made to produce pure iron on an industrial scale by means of electrolysis, which modern metallurgy recognizes as the "tonnage production" method for metals in a pure form, and which is the established process since a number of years for pure copper, gold, silver, aluminum, lead, zinc, etc. The combination of unexcelled cheapness with unexcelled utility for many purposes, possessed by *impure* iron, has diverted attention from the superior utility of the *pure* metal over pure copper, aluminum, etc., at a fraction of the price. We now know that pure iron is at least as soft and has better cold-working or drawing qualities than either pure copper or aluminum, besides having great advantages for household and machine purposes in respect of price, durability, maintenance of a bright surface, resistance to corrosion or tarnishing, to heat, etc.

Speculations as to the properties of pure iron—that is, iron of at least 99.99 per cent Fe.—which have been based upon researches carried out on metal having 99.50 per cent purity, are now known to be well below the actual quality of the metal in such properties as softness, malleability when cold, ductility, magnetic qualities and, probably, resistance to corrosion. The

extension of opportunities for research offered by the present industrial production of pure iron on a tonnage scale opens up a fascinating field of investigation for universities, research laboratories and others, with bright promise of discoveries having both scientific and commercial interest and importance.

Specimens of electrolytic iron exhibited in museums as "rare aves" may now be relegated to positions of mere historic value, because at least two industrial establishments are producing yearly hundreds of tons of metal having equal or greater purity than they possess. One of these plants is at Hawthorne, Ill., a second at Grenoble, France, and rumor has it that the Germans, under the stress of need for a metal with the softness of copper, produced noteworthy quantities of electrolytic iron during the war by the Fischer-Langbein-Pfanhauser process. And even in this brief summary mention should be made of the work of C. F. Burgess in America, and Cowper-Coles in England, because both contributed valuable aid to the final success of this useful and important industry.

Process of the Société "Le Fer"

The Société "Le Fer," which numbers among its directors the eminent metallurgist, Dr. Léon Guillet, controls the patents of Anthèlme Boucher, which were under laboratory investigation for several years prior to 1915, when the first industrial installation was made at the iron and boiler works of MM. Bouchayer and Viallet at Grenoble, France, using electricity from

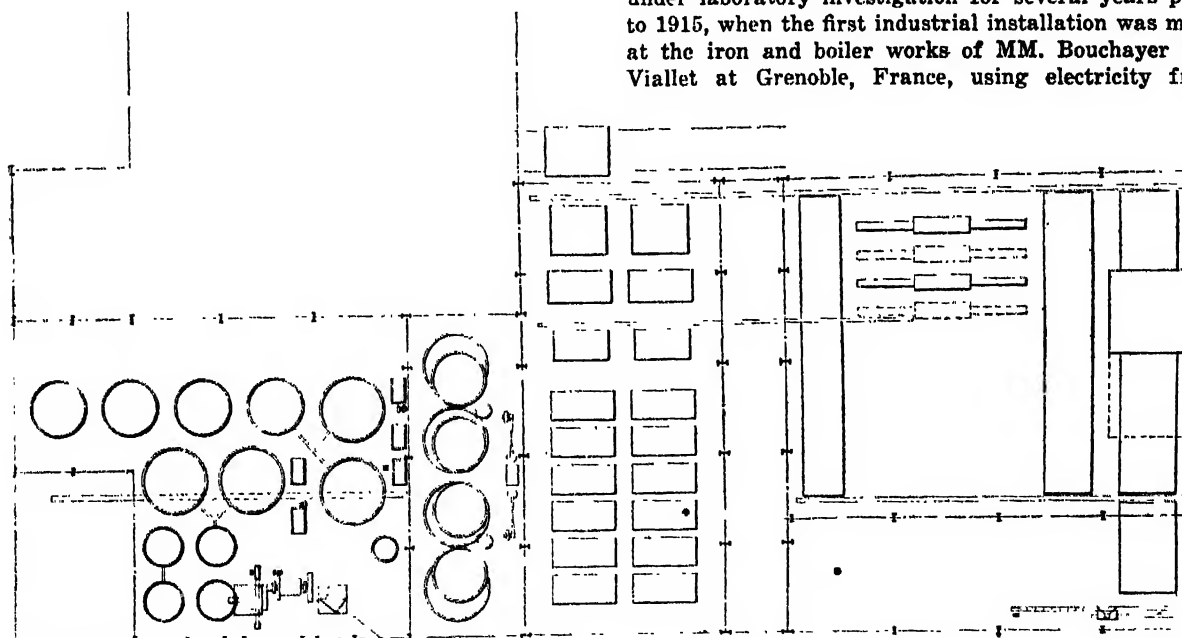

Fig. 1—Electrolytic Iron Plant Laid Out on the Unit System So As to Be Capable of Duplication. The pyrrhotite is delivered to the plant crushed through 200 mesh and concentrated by flotation so as to be practically free of any soluble impurities such as lime, magnesia and zinc

The Leaching House Contains: 4 first agitators mechanically agitated; 2 Dorr single tray thickeners; 4 final agitators mechanically agitated; 2 final Dorr single tray thickeners with the necessary filter presses; 4 cementation tanks for precipitation of copper; 3 overhead feed tanks and 2 heater tanks in which electrolyte is heated. There are also the necessary pumps and acid-proof transmission lines where necessary

The Cell House Contains: 2 or 3 acid-proof pumps for electrolyte circulation; 132 cells for deposition of 10 tons of 6-in. tubes $\frac{1}{4}$ -in. thick per day; 2 wash tanks for cathodes; 2 racks for mandrels; 2 racks for cathodes; 2 electric overhead traveling cranes and 1 transfer table

The Stripping and Drawing Room Contains: 1 storage rack for mandrels with tubes thereon; 1 electric annealing furnace; 2 motor-driven strippers; 1 tube rack and 2 tube draw benches with necessary conveyors

The Finishing and Shipping Department Contains: 1 tube storage rack; 1 tube conveyor; 1 cold saw; storage skids for finished tubes; 1 scrap hopper and 1 scrap conveyor

hydroelectric plants in the Swiss Alps. The process and works have been so well described and illustrated in the technical press, and especially by Guillet in *Revue de Métallurgie, Mémoires*, 1915, February, page 82, and by Jean Escard in *Le Génie Civil*, 1919, Aug. 23 and following issues, that details may be omitted here.

The electrolyte is ferrous chloride; the anode is iron in the form of cast iron; the cathode is a revolving mandrel upon which the pure iron (containing about

one-third of a horse-power year per ton of tubes produced.

In the matter of purity the Boucher tubes excel any other industrial product, and the process has the great advantage that a thin tube, which is the most costly to make by the prevailing boiler tube process, is the cheapest to make by the electrolytic process. M. Bouchayer says that he is able to meet all commercial competition in producing thin tubes, and he plans the construction of a second plant relatively near Grenoble, which would have double the capacity of the present plant.

Process of the Western Electric Co.

The research departments of the American Telephone & Telegraph Co. and the Western Electric Co., in seeking a commercial process for the manufacture of pure iron in a pulverized form, employed the very ingenious expedient of utilizing the hardness and brittleness of electrolytic iron from which the hydrogen had not been eliminated, in order to get the material into a finely powdered form and compress it into magnet cores which would have high electrical resistance because the particles were not soft enough to crush together into a unit mass. When these operations were concluded, the compressed cores were baked to remove the hydrogen, leaving pure iron particles.

This process proved cheaper and better than reducing the iron powder by hydrogen from the oxide. A commercial electrolytic iron plant was therefore equipped at Hawthorne, Ill., with a capacity of about two tons of iron per day. This method of securing pure iron proved to be relatively inexpensive and to afford a

Fig. 2—Characteristic Curves of Electrolytic Iron

99.97 per cent Fe.) is deposited in the form of a tube, which is annealed to eliminate the embrittling hydrogen, stripped and used as a boiler tube, either with or without drawing through a die.

The metal is so soft that no inner "ball" is used in the drawing operation. The 0.03 per cent of impurity is made up of the metalloids of the cast iron, namely: Traces of carbon, silicon, sulphur and phosphorus. Hydrogen, which deposits with the metal, is completely eliminated by heat, as indicated by chemical analysis and physical properties, which will be described later. I have before me not only the two French monographs mentioned above, but also a thorough professional report by a Swiss engineer, and two independent reports by American engineers, each of whom made a couple of visits to the Grenoble plant, where every opportunity

Fig. 3—This Characteristic Curve of Electrolytic Copper Represents the Change in Physical Properties Which Accompanies Cold Work on the Metal. The abscissae represent percentage of reduction in cold rolling

was afforded them by M. Bouchayer for inspection of the process. From the commercial viewpoint the Boucher process gains by avoiding the following operations in the making of a boiler tube: Purifying the pig iron; rolling and piercing the billet; annealing and rough-shaping the tube. The costly items are as follows: Cast iron for anodes;* loss of about 20 per cent in slimes due to the use of a soluble anode; and the use of electricity, which amounts to about one-quarter to

*Furthermore, a very impure cast iron must not be used, because some of the metalloids will migrate to the cathode.

Fig. 4—Characteristic Curves of Tubing Metal

ready means of controlling the quality of the material.

The cores of the loading coils which are introduced at regular intervals to increase the inductance of a telephone circuit are now made of this material. The electrolyte is of ferrous sulphate and chloride and ammonium sulphate; the anode is mild steel; the cathode of polished sheets of steel, from which the deposited metal is stripped when it has reached a thickness of $\frac{1}{4}$ to $\frac{1}{2}$ in.; the current density is about 12 amperes per sq. ft. A brief description of the plant and process is given in the *Journal of the American Institute of Electrical Engineers*, July, 1921, pp. 598, 599, 608, and 609. The magnetic and electrical properties of the material and the completed cores are described on pp. 600 to 608.

Electrolytic Iron Direct from Ore

The deposition of iron by electrolysis is from the electrolyte directly on to the cathode. The use of a soluble anode is only a means of keeping the electrolyte supplied with iron. Any other means of accomplishing the same result would give the same deposition, electrical efficiency, etc. For example, the circulation of the electrolyte, always maintaining it up to the desired standard of iron content, would effect the electrolytic action and avoid some disadvantageous features, such

as the economic waste due to the loss in slimes with the soluble anode, the migration of impurities from anode to cathode, etc.

This is the novelty introduced by Frederick A. Eustis and Charles P. Perin in patents issued the former and developed jointly by them. This process has passed through the laboratory stage and commercial installation is under way. The solution of iron ore is the means of keeping the electrolyte enriched in iron in proportion as it is impoverished by the electrolytic deposition. The electrolyte is ferrous chloride; the anode is of some insoluble material such as graphite; the current density is 50 amperes per sq. ft. The cathode may be a revolving mandrel on which the iron is deposited in the form of a tube, or it may be in the form of a sheet, or a traveling belt from which the crumbs are removed continuously by mechanical means.

The process thus resembles the copper leaching and deposition process so successfully carried out at Ajo,

amount of copper, and the operations will deliver in marketable form the iron, the sulphur, and the copper in one short series of processes.

Pure iron is deposited on the cathode and the ferric chloride formed in the anode compartment is used over again for leaching, thus making the process cyclical. Sulphur is recovered as brimstone and copper is precipitated out on scrap iron. The speed of leaching depends on the fineness of pulverization of the ore, but presents no difficulties whatever after extended laboratory tests, although it is important to avoid unnecessary use of chlorine by mechanically separating such oxides as lime and magnesia before solution. Leaching is assisted by the circumstance that the reaction is exothermic. Counter current extraction has resulted in delivering 97 per cent of the iron, and 90 per cent of the sulphur content of the ore.

It is unique in metallurgy for one brief cycle of operations to deliver in marketable form more than 90 per cent of any ore. In the electrolytic vats the electrolyte is circulated vigorously, resulting in smooth, compact deposits being obtained; the cathode current efficiency is 90 per cent and over. With proper control no chlorine is lost, or other noxious gases given off. Each step of the process uses standard apparatus which has been developed after years of commercial operation, so that the transition from laboratory to full-scale industrial operation involves no costly experiments. The design of a plant to produce 10 tons of finished tubes per day, using standard apparatus, is shown in Fig. 1.

Purity of Electrolytic Iron

The only serious impurity in electrolytic iron is hydrogen, and this may be entirely removed by baking at a moderate temperature. Traces of other elements may be present by inclusion during deposition, but no great precautions are necessary to produce metal assaying 99.9 per cent and higher. Tubes made at Grenoble and analyzed in America showed 99.97 per cent Fe., and tubes made by the Eustis process assayed 99.99 per cent. It is noteworthy that it costs no more to make the very pure material than to deposit metal of inferior grade, depending upon the process employed.

Mechanical Qualities of Almost Pure Iron

The mechanical qualities of pure iron are greatly affected by heat treatment and cold working; furthermore, the presence of hydrogen, due either to original deposition or to absorption at a red heat—for some persons, through inexperience, have "annealed" the metal in hydrogen gas and then tested it tensilely—destroys its strength and renders it both hard and brittle as well. The crystalline structure of the deposited metal is fairly coarse and well defined. It is refined on appropriate annealing, (see Fig. 5), and, on rolling or drawing in the cold state, it takes a beautiful fine structure and brilliant polish, which is more than ordinarily durable on exposure to the atmosphere, dampness, etc. Naturally this refining of the structure is accompanied by increase of strength.

An average of tests made by the National Tube Co. on tubes made at Grenoble, in the condition in which they were received, showed tensile strength in the direction of rolling 62,000 lb. per sq. in., and elongation of 12 per cent in 8 in.; the average of three tests of similar material, redrawn and annealed at 900 deg. C. for 20 min. gave 39,000 lbs. per sq. in. tensile strength and 30 per cent elongation in 8 in. (See tests No. 4 and 6 in the table). The bursting strength of a Grenoble tube 4 in. in diameter and 0.03 in. thick, reported by Escard in the *Génie Civil* article cited above, was 1110 lb., corresponding to a fibre stress of 73,500 lb. per sq. in. It is very probable that pure iron, like very soft steel, would increase greatly in tensile strength

Fig. 5--Photomicrograph of Electrolytic Iron made by the Eustis Process, 100 Diameters

Arizona, and elsewhere, and the established process of electrolytic zinc production. It faces the necessity of producing a metal which must sell in competition at a price lower than that of copper or zinc, but has the advantage of much lower price for ore and absence of some of the chemical difficulties encountered in the leaching and electrolysis of zinc. It may also be employed in localities where iron ore and a market for iron and steel exist, but where solid fuel for smelting is costly. It differs from the usual "direct process" in that it can deliver a product in finished form, ready for market, instead of a "sponge" which is commercially equivalent to a poor grade of steel scrap and must be submitted to several processes before it has industrial usefulness. It differs from the electric smelting of iron in that it will produce a very pure product without the use of any flux.

Obviously, it can be applied to any iron ore capable of solution, but its cheapest raw material is the abundant sulphide ores which occur in many parts of the world and which sell at a low price, because, first, of their abundance, and second, their inapplicability to blast furnace smelting until after a process of complete roasting. Such ores also yield their sulphur content as a by-product, at a price which more than covers both the cost of sulphur production and the total cost of the ore itself.

Application to Sulphide Ore

The present projected application of the Eustis process is to an iron sulphide ore containing a small

without losing much in ductility by subjection to a double heat treatment.

Table of Tensile Tests of Electrolytic Iron Tubes
(Made at Grenoble, France)

Cold-Working Properties

In *Le Génie Civil* monograph tests are described and photographs given showing the extraordinary softness and cold workability of the Grenoble tubes. Escard says it is the regular practice at Grenoble to draw five times through a die without annealing, as compared with the customary practice with soft steel to anneal before each draft. This statement is corroborated by tests made in America, at the plant of the Stanford Steel Products Co., of iron made at Grenoble and iron made by the Eustis process. Tests of cold rolling, deep stamping after cold rolling and without annealing, cold rolling and beading, threading, etc., showed that the electrolytic iron would undergo work with much less frequent annealing than soft, open-hearth steel, and would endure more cold deformation without cracking than ingot iron, Toncan metal, and, in some instances, electrolytic copper.

This softness and ductility opens a wide field of usefulness, because the saving in cost of annealings alone—which is an expensive item in cold rolling work—is an important economic feature, besides the greater ease of working and lessened defective articles. Additional light on the cold-working qualities of pure iron is shown by Fig. 2, "characteristic curve," with which are compared electrolytic copper (Fig. 3) and "Tubing Metal" (Cu 75%; Zn 25%). The latter is given because its qualities so much resemble those of pure iron.

Resistance to Corrosion

A test made at the Massachusetts Institute of Technology by Prof. Carle R. Hayward showed that a piece of Byer's wrought iron pipe corroded nearly twice as much, and Shelby steel tubing 2.6 times as much in the atmosphere as electrolytic iron made by the Eustis process. According to the same authority, an immersion test of 22 hr. in 5 per cent sulphuric acid gave a ratio of loss of weight per unit of area:

For electrolytic iron..... 1.00

For steel 4.25

* For wrought iron..... 18.50

Magnetic Properties and Electrical Resistance

The superiority of electrolytic iron for some kinds of electromagnets has already been discussed under the head of the electrolytic process of the Western Electric Co. Tests made in the laboratories of the General Electric Co. showed some samples of electrolytic iron gave lower, and some higher, values for permeability and hysteresis loss than the usual standard silicon steel sheets, depending on treatment and

source. It seems evident then that the best preparation of this material for magnetic purposes has yet to be found.

Tests made in the electrical engineering laboratories of the Massachusetts Institute of Technology showed that electrolytic iron made by the Eustis process had a specific resistance of 10.0 microhms per cm. cub. at 20 deg. C. This is six times as great as copper, but only 80 to 90 per cent. that of ordinary iron wire. These figures are confirmed by tests made by the General Electric Co. on iron from Grenoble and from other sources.

Fields of Usefulness

There are many articles whose value is dependent more upon their quality, or upon the amount of labor expended on their fashioning, than upon the cost of the material of which they are composed, so that one or two cents more per pound paid for the steel would return, with profit, in the price secured for a superior article, or would be more than made up in saving on labor in fashioning, or saving of defective product. Thus, a softer steel would require less force and less annealing than the grades now available for the manufacture of hundreds of tons of cold rolled and deep stamped articles, such as ware for enamelling; receptacles of various kinds, like oil cans; vacuum bottles; grease cups; thin stamped articles, like buttons; door knobs; shot shell steels; toys, and other thin stamped goods; bodies of automobiles, etc. There are other stamped articles, like the mirror reflectors for headlights, etc., which will not retain perfectly their shape after deep stamping, because of the springiness, or lack of softness or ductility, of the steel; softer electrolytic iron would retain exactly the mathematical form given by the dies.

This advantage would far outweigh the slightly greater cost of pure iron for this purpose. Stamped and beaded articles, like threaded caps, can be made with less annealing and less defective material. The possibility of greater thinness would find its advantage wherever heat conductivity is important, as, for instance, boiler tubes; and even the cook knows that tin cooking utensils bake quicker than aluminum, because they are thinner. The beautiful polish assumed by pure iron after cold rolling, and its resistance to corrosion, may result in cooking utensils being made without tin, and so perhaps avoiding the color which tinned articles assume after heating, and which is the great selling argument for aluminum and nickel utensils.

Thin boiler tubes is a use already mentioned, and involving enormous quantities. Many articles now stamped of copper, because of its softness, could be stamped of electrolytic iron at a greatly reduced price. Where the advantage of increased resistance to corrosion is valuable, there are many uses, such as caves troughs; boiler tubes (again); pipes and culverts; containers for water and corrosive liquids; parts of automobiles requiring to be bright; ornamental articles to be nicked and exposed to the weather, where rust soon attacks ordinary steel through its coating and mars its attractiveness; even galvanized, or tinned and painted goods would be more durable if the body of the material were of a less corrosive nature.

Add to this the economic possibility of making electrolytic iron in districts where solid fuel is now too costly for smelting, and we can visualize the commercial advantage of the new industry to localities which already use, or would use, large quantities of articles whose high price is due more to the labor expended on fashioning them than on the cost of the basic material. We are only beginning to secure the information as to the kind and amount of such articles. Where purity

alone is important, we have material like welding wire, for which a fancy price is now paid for relatively pure material. Iron for magnetic purposes has already been mentioned. It is thought that, as greater quantities of pure iron are available for research, investigation will enlarge this field. Electrical conductivity purposes should be included; and, finally, pure material as the basis for the manufacture of high grade, high priced steel for alloy steels, cutting tools, etc.

Electrolytic iron may be produced directly from the electrolytic vat in the form of a tube, suitable for use as a boiler tube; or it may be in the form of a cylinder which can be mechanically slit into strips of any desired width, gage or length in reason. These strips may be the equivalent of strips for cold rolling, or they may be of very thin gage equivalent to partially

cold rolled material, or rods for "rounding" and drawing into wire.

The "characteristic curves" of electrolytic iron compared with electrolytic copper shown in Figs. 2 and 3 indicate the use of this material in the form of wire for electrical purposes. It is evident that the wire can be cold rolled so as to have far better tensile properties as transmission lines than electrolytic copper. It will be noted from the previous tests quoted that electrolytic iron has 10 to 20 per cent greater conductivity than steel. It is therefore about the equivalent of copper clad steel; or the electrolytic iron may be copper clad, thus increasing its conductivity by another 20 per cent or so, and leaving it still not so soft and ductile as to have the objectionable stretching qualities of copper in transmission lines.

Pig Iron and Heavy Melting Steel Prices

In Nine-Year Period Iron Ranged from 3.79 to 116.8 Per Cent Higher Than Scrap—Interesting Side-lights on Law of Supply and Demand

BY H. A. KNIGHT

"HEAVY melting steel scrap is more active and higher. Recent prices have been enough below pig iron to increase the use of scrap as against pig iron at open-hearth plants."

The above paragraph is an extract of THE IRON AGE summary of market conditions for Nov. 10, 1921. It suggests a study of prices of heavy melting steel as compared with basic pig iron, both raw materials for the open-hearth furnace. For the purpose of this study, the quotations of these commodities have been investigated for nine years, thereby including the year 1913, when pre-war conditions prevailed.

The most representative basis of comparison is expressed by the percentage by which basic pig iron prices exceed those of heavy melting steel. For the nine-year period (this includes only 10 months of 1921) the price of pig iron exceeded that of scrap by 36.11 per cent on an average. The excess percentage for 1921 is the highest for the period, being 77.40 per cent. For 1920 it was 71.02 per cent; for 1919, 62.35 per cent; in 1918, only 16.18 per cent.

That this differential percentage is approaching the normal figure of 36.11 per cent is indicated by the fact that the percentage has dropped from 106.2 per cent in January, 1921, to 45.5 per cent for December, 1921.

The high water mark of this differential percentage was reached in March, 1919, when pig iron prices were 116.8 per cent higher than scrap; the low water mark was attained in March, 1916, when basic was only 70 cents higher, or 3.79 per cent.

The quotations used are those published weekly in THE IRON AGE, averaged each month. The heavy melting steel prices appear in the Pittsburgh market reports on old material, these prices representing "delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate." The basic pig iron prices are also quoted in the Pittsburgh market reports, being those prevailing at furnaces in the Mahoning and Shenango valleys. We have added the freight from the valleys to Pittsburgh, which has varied in this period from 90c. to \$1.96 a ton, in order that we may get our iron prices upon the same delivered Pittsburgh basis as the heavy melting steel.

Highest Pig Iron Prices

The highest point reached by pig iron was \$53.45, the average for July, 1917; the peak in heavy melting steel was touched the month previous, when \$41 per gross ton was the average for June. The lowest average for basic was in January, 1914, the price being \$13.40; the

lowest for scrap was in November, 1914, when the average was \$10.

When there was a difference of 116.8 per cent in the price of basic over heavy melting steel in March, 1919, pig iron was selling at \$30.34 (monthly average) and scrap at \$14. The Government had released control of prices on Jan. 1, 1919. That month the price of \$30, Valley furnace, for basic was agreed upon after it had been recommended by the price committee of the American Iron and Steel Institute. On March 21 this price was reduced \$4.25 per ton after the conference between the Industrial Board of the Department of Commerce and a special committee representing the iron and steel industry. Business in both pig iron and scrap was very poor during this month. However, the pig iron prices were kept up because of the influence of the official character of these March 21 price fixings. Scrap, however, did not have any official backing, so to speak. THE IRON AGE, reports for March 6 under a Pittsburgh date line read as follows: "Conditions in the scrap trade are no better in any direction and some dealers believe they will be worse before there is any betterment. There is no demand from consumers, whose stocks are heavy. Any scrap disposed of to consumers is by forced sales of material on cars that has to be moved and is sold at the best prices dealers can secure." Mention was made of a large list of scrap issued by the Pennsylvania Railroad, bids on which were lower than had ruled for several years.

Very Little Difference

When there was only a 3.79c per cent difference between prices of basic and heavy melting steel in March, 1916, pig iron prices averaged \$19.15 for the month and scrap, \$18.45. Again, conditions were unusual. There was a great abundance of iron. THE IRON AGE, for March 9 declared: "Production is now proceeding at the unprecedented rate of 39,500,000 tons a year." Next week it was stated: "There is thus far none of the tension in pig iron that has long been seen in the steel end, nor are there signs of famine conditions." For heavy melting steel, on the other hand, there were both an enormous demand and a great scarcity. In one week the United States Steel Corporation bought 100,000 tons of heavy melting steel for plants in the Chicago and Pittsburgh districts. According to THE IRON AGE report of March 9, "There are many evidences of difficulty of covering short sales, particularly heavy melting steel. For the present a real shortage of scrap exists, as distinguished from the not infrequent apparent shortages of the past." The United States steel

mills were busy during this period with orders for the foreign warring countries. According to THE IRON AGE, of March 2, "Steel prices are rushing up at a furious pace and in the past week conditions have grown more excited."

In July, 1917, instead of the great abundance of pig iron which prevailed in March, 1916, conditions were the reverse and pig iron touched the highest peak of the period, the month's average being \$53.45. We reported then: "Sales are light, not because of lack of inquiry, but because iron can't be had. Basic advanced in June over May \$7.26, the highest advance in one month in the whole history of the pig iron trade." Basic did not remain on its pedestal long, however,

freight rates from the principal producing centers of pig iron and scrap to the principal consuming centers. There are 80 hauls tabulated; in four of these the freight rates on iron and scrap are the same; in six, pig iron rates are higher; in the rest, or 70, scrap takes the higher rates. For instance, from Birmingham to Cincinnati, pig iron is favored to the extent of \$1.245 per ton, or 28 per cent from Chicago to Moline, the difference is 70c. per ton, or 85 per cent; from Cleveland to Toledo, pig iron is favored 42c. per ton or 17 per cent. At present it is impossible to move scrap any considerable distance because of the high freights. Theoretically, at least, scrap is therefor not in a position to compete so keenly with pig iron, which has lower rates.

The Solid Line Represents Prices of Basic Pig Iron. The broken line portrays heavy melting steel. The dotted line shows the percentage difference in price between basic and heavy melting steel. The solid and broken lines are governed by the dollar scale at the right; the dotted line, by the per cent scale at the left

because of railroad embargoes against shipment of American iron abroad, which turned iron, held up at the ports, into resale iron, bringing the market down \$3 a ton.

High Price for Heavy Melting

Heavy melting steel reached its high price one month previous, touching \$41 for the month's average. Quoting from THE IRON AGE of June 7, "The whole scrap market is very much excited, material of all kinds being scarce and dealers looking for higher prices. They point to the shortage of ore, the increase of open-hearth capacity by 3,000,000 tons in the past year without a corresponding increase in pig iron output." Next week it was stated, "It seems that steel scrap has finally come into its own." Later that month—"The supply of scrap of all kinds available for the market is short of meeting the demand and some dealers are holding scrap for higher prices."

When pig iron reached its low of \$13.40, average for the month of January, 1914, the steel industry was in a great depression. Some of the steel mills were starting to resume "after one of the longest and most extensive holiday shutdowns the industry has known." The "million-idle-men" exhibit had been paraded before Congress to call attention to the Government the serious conditions of unemployment.

Heavy melting steel's low mark was reached in the same year, but during November. THE IRON AGE reports said: "There is no inquiry for scrap from consumers and the only trade is between dealers. Operations among open-hearth steel plants have been on so low a basis for some months that the consumption of scrap has been more than cut in half." A later report stated that the mills using scrap were operating at from 35 to 40 per cent capacity.

Effect of High Freights

The use of scrap has been lessened because of freight rates, which are higher on old material than on pig iron. A scrap concern in Chicago has drawn up a chart of

Lack of competition, then, would tend to keep the prices of pig iron and scrap far apart. Perhaps that is one reason why, in December, 1921, there was still a 45.5 per cent difference.

As "history repeats itself," a study of the past should prove a guide to the future. Valuable lessons should be learned from the fluctuations of the past nine years.

Election of Officers of Allied Machinery Co. of America

The directors of the Allied Machinery Co. of America at a meeting held in New York on Dec. 23 elected the following officers for the ensuing year: J. W. Hook, president; S. T. Henry, vice-president; E. M. Hartridge, vice-president, in charge of business in Europe; T. G. Nee, vice-president, in charge of business in the Orient; W. H. Gilbert, treasurer; Gordon C. Carson, secretary. The directors of the company are the following: J. W. Hook, M. C. Brush, John E. Gardin, T. W. Streeter, H. A. Arthur and Gordon H. Balch.

Purchasing Agents to Have Exposition

The National Association of Purchasing Agents, 1408 Kimball Building, Chicago, has completed plans for its seventh annual convention, May 15 to 20, 1922, at Rochester, N. Y., in conjunction with which there will be an exposition of products of all kinds which its members buy. The exhibit feature, which has been named the "Informashow," will take place at Exposition Park, Rochester, and a large number of exhibit spaces will be provided for manufacturers who desire to take advantage of this opportunity to display their goods before the purchasing agents.

Sheet metal contracting interests at Youngstown, Ohio, have established a course of training for apprentices, classes meeting regularly, in order to solve the problem of the dearth of skilled journeymen.

New Foundry for Casting Chilled Rolls

Raw Material Charged in Air Furnaces Direct from Stock
Pile at Garrison Foundry, Pittsburgh—Parent
Company Made Cannon Balls

BY GEORGE F. TEGAN

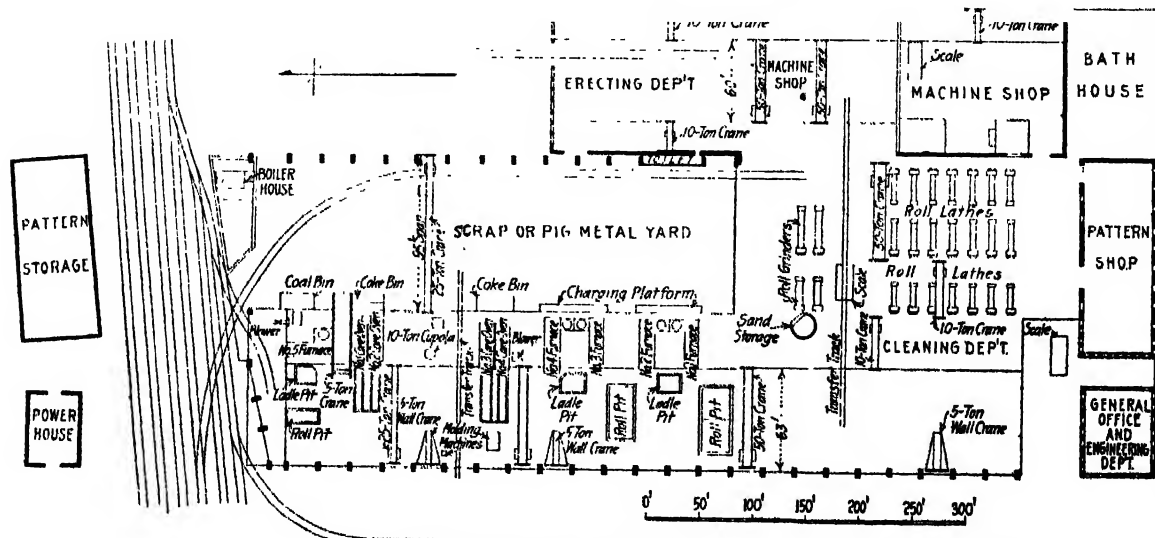

IT is a far cry from casting cannon balls for General Jackson at the Battle of New Orleans and for Commodore Perry in the Battle of Lake Erie in the War of 1812, to the building of rolling mills and the casting of rolls weighing 45 tons or more. In 1803 the company now bearing the name of the A. Garrison Foundry Co. came into existence and it has kept pace with the growth of Pittsburgh. It was the pioneer producer west of the Alleghenies of chilled iron rolls, but did not stop there; for in the development of the present day rolling mills, notably for rolling steel plates, the company played an important part. Hanging in the company's office is a photograph of a 3-high, 24-in. plate mill, which was exhibited and was awarded a grand prize at the Centennial Exposition in Philadelphia in 1876. This was more than 30 years after the company had cast its first chilled iron roll. So long has the company been making rolls and rolling mills that its name has become synonymous with those products. Keeping pace always with the demands for rolling equipment, not only for the finishing of steel but of all other metals which have to be rolled for further manufacture, the company today is equipped

to meet the most extreme demands with regard to size, whether they are for mills or rolls. This largely is so because of the completion of a new foundry, work on which has been in progress during the past year or more, which was erected without interruption to the operation of its old foundry, and over which the new one was built.

In the issue of October, 1885, of the *Magazine of Western History*, edited by William W. Williams and published in Cleveland, was a personal sketch of Abraham Garrison, from whom the company takes its name, which we quote:

"The first iron foundry in Pittsburgh, and probably the first west of the Allegheny Mountains, was built in 1803 by Joseph McClurg, Joseph Smith and John Gormley, and was called the Pittsburgh Foundry. It stood on the ground now occupied by the custom house and postoffice,* corner of Fifth Avenue and Smithfield Street, until 1852, when it was removed to its present location on the south side of the Monongahela River, embracing the squares bounded by Ninth and Tenth streets, Bingham Street and the river. On

*Now occupied by the Park Building.

(Above) The New Foundry Is at the Left. The office buildings are at the junction of the two streets; the building housing the pattern shops and pattern and lumber storage are at the right. Below is a plan of the new foundry

the shelves of its lofts are still to be seen patterns which recall the infinite variety of its former business, and the early history of western Pennsylvania. In 1812 were cast in this foundry the cannon balls which, on the outbreak of the war with England, were sent to New Orleans and used by General Jackson on the memorable eighth of January, 1815. Many of our Pittsburgh readers will remember hearing their parents tell of the time when a dozen wagons were seen waiting, at once, in front of the old foundry for the projectiles to become cool enough to be shipped to Commodore Perry on Lake Erie. After peace was declared, the molten metal was poured into ploughshares instead of cannon balls, and water pipe, hollow ware, threshing machines, castings and stoves took the place of the instruments of war.

"The first chilled roll made west of the mountains, the manufacture of which was destined to become the great specialty of the Pittsburgh Foundry, was cast in 1825 at the Eagle foundry of Kingsland, Lightner &

Garrison, and from 1863 to 1865, Bollman, Garrison & Co. In 1864 Mr. Garrison bought Mr. Bollman's interest and the partnership of A. Garrison & Co. was formed Jan. 1, 1865."

The sketch credits Mr. Garrison with having begun, in 1842, to furnish the sheet brass mills of the Naugatuck Valley in Connecticut with chilled rolls, which prior to that time had been imported from England. In passing, it might be stated that today the company is particularly conspicuous as a maker of rolls for mills running on copper and other non-ferrous metals. Besides having helped to capture the home market for chilled rolls for American manufacturers, it is an exporter on a fairly extensive scale both of rolls and mills. Recent shipments of the company were of two 44-in. plate rolls, each weighing 80,000-lb., to Japan; a 34-in. x 100-in. 3-high plate mill and a 42-in. 3-high Universal plate mill to Italy.

When the health of Mr. Garrison failed in 1862, the company passed to the management of his son-in-

A Spur of Track of the Allegheny & South Side Railroad Runs into the Storage Yard. The crane is of 25-ton capacity, with a span of 95 ft. During the war it was necessary to use this yard for erecting mills for shipment to take the load off the machine shop

Co. As rolling mills began to be built in western Pennsylvania, the Pittsburgh Foundry was equipped to supply their machinery.

"The Pittsburgh Foundry can boast of fewer changes of ownership during the 82 years (to 1885) of its existence than most establishments of its age in the United States. Shortly after its erection Joseph McClurg bought out his partners, Smith and Gormley, and with his son, Alexander McClurg, conducted the business successfully till 1814. From 1814 to 1822, the foundry was owned and operated by McClurg and McKnight and then by Alexander McClurg & Co. till 1830, when the establishment was purchased by Kingsland, Lightner & Co., proprietors of the Jackson and Eagle foundries, the business of which was merged into that of the Pittsburgh Foundry. From 1831 to 1836, the firm was known as Kingsland, Lightner & Cuddy. In 1836, Abraham Garrison obtained an interest in the business, and in 1840 Mr. Garrison, who was a nephew of Kingsland, and H. L. Bollman, a nephew of Lightner, succeeded their uncles, and associating with them H. F. Bollman, carried on the business under the name of Bollmans & Garrison till 1851, when H. F. Bollman withdrew. From 1851 to 1863 the firm was Bollman &

law, J. H. Ricketson, who held the presidency until his death in 1900. His son, J. H. Ricketson, Jr., was then elevated to the presidency, and has been active head ever since, except during the period of the world war, when he served as a captain in the 315th United States Infantry in France. The other officers of the company are O. G. Ricketson, vice-president; J. R. Williams, treasurer and general manager, and G. W. Caulkett, secretary and assistant treasurer. The officers of the company also form the board of directors.

By the completion of its new foundry the company now possesses the facilities for taking care of demands for mills exceeding in size any now installed, and for rolls of larger diameter and wider face than are now operating. The capacity of the equipment of the old foundry was taxed to the limit in the casting of one roll 42 in. in diameter with a face of 152 in. In the new plant the company has arranged for a pit capacity of four rolls, 44 in. in diameter, also for rolls having a rolling surface up to 210 in. long. Dozens of small rolls can be poured daily.

The new structure, which replaces the one of brick erected in 1852, when the company moved from its original location to its present one, is of all steel con-

In the Background and at the Right of the Molding Floor Is a Cupola. The core ovens are in the center and at the left is No. 5 furnace and ladle

struction, with the exterior of asbestos-protected corrugated sheet steel. The roofs are Pond truss type with operating steel sashes, which assure perfect ventilation and ready egress of mold and furnace gases. These roofs are covered with a gypsum compound, which it is claimed keeps out the heat in summer and the cold in winter, and also obviates the need of painting, while repairs are seldom necessary. The building begins a short distance below Bingham street and extends down Ninth Street in the direction of the Monongahela River, 480 ft. to the tracks of the Allegheny & South Side Railroad, a connecting line with the Pennsylvania and the Pittsburgh & Lake Erie railroads. A spur of the Allegheny & South Side Railroad runs into the yard of the company, which thus has the service of the two trunk lines with which that road connects. The building comprises a main bay, 60 x 480 ft., and a leanto, 30 x 400 ft. The latter has an additional floor at an elevation of 25 ft. The foundry building thus has an effective area of over 40,000 sq. ft. The entire plant, with the foundry and shops, covers several acres. The impressive features of the building are the skillful utilization of this area and the practically perfect lighting achieved by the generous use of steel sashes on all sides, aided by the fact that the structure stands apart from other buildings, and consequently is free of light obstructions.

As will be observed from the accompanying layout

plan, the deep pits for casting long rolls are located conveniently near to the melting units and the pouring pits. These casting pits, which go below the level of the bed of the Monongahela River, are water tight. The smaller of these pits is 26 ft. deep and 30 ft. long and 15 ft. wide. The dimensions of the larger casting pit is 40 ft. long by 18 ft. wide. The upper end of the foundry floor is used as storage for chills and flasks. The leanto floor forms an alcove which affords storage space for refractories and other material which must be readily available, and surmounts the furnaces, cupolas and core ovens, which thus are installed off the main foundry floor. In the old foundry was a round casting pit, 15 ft. in diameter and 24 ft. deep, which is located in the leanto of the new plant. It was the first plan of the company to fill in this pit, but later it was decided to use it for a winter storage for sand, thereby keeping it dry.

The melting units already in operation consist of two 15-ton and one 25-ton coal-burning stoker-fired air furnaces and a cupola, with normal capacity of 15,000 lb. of metal per hr. but which, if forced, can produce 20,000 lb. Two more air furnaces are to be installed later, these being indicated in the layout plan as Nos. 1 and 2. Furnaces already in are Nos. 3, 4 and 5. Nos. 1 and 2 are paired, as are Nos. 3 and 4. No. 5 stands at the lower or river end of the building. Besides the feature of stoker-firing, in which the company

A 42-In. x 152-In. Chilled Iron Roll Is Here Being Turned in a Lathe

The Fine Smooth Surface, So Necessary in Rolls for Mills for Non-Ferrous Metals, Is Obtained in This Improved Grinder or Polisher. The new type of tool has a completely enclosed headstock

has been a pioneer and claims to have had a good success, is the charging arrangement. As the furnaces back up to the storage yard, pig iron and scrap are charged direct from the stock piles and the labor and handling costs thus are reduced to a minimum. The furnaces, pits and the foundry proper are served by two overhead electric traveling cranes, one of 50 ton capacity and the other of 25 tons, while for handling the flasks for the molders there are three 5-ton wall cranes. Another 50-ton main bay crane is to be installed. The molding floor covers an area of 25,000 sq. ft. An air-operated jarring machine is used to mold medium-sized flasks, while several small machines are used for small work. Compressed air is used for ramming the sand and for chipping. In the cutting off of risers, the company has experimented with gas and electric torches, but without success—at least not for cutting the surplus metal from roll castings, which can be removed only by heavy roll lathes.

A mezzanine floor, independent of the leanto floor and below it at the lower end of the building, contains the motors and blowers for the cupola and air furnaces. This floor and the main one above are steel plate over a concrete base. A 24-ft. elevator at this end of the building, with an opening to the stock yard, lifts coke,

pig iron and scrap for charging into the cupola. It also serves a core room and core ovens on the main leanto floor. This floor is to be served by a monorail system running its entire length and to extend out to the storage yards, where the company is to construct a coal pocket, etc. Coal is to be conveyed in grab buckets from this storage to the air furnace hoppers opening on this floor. Aside from the coal handling, the monorail system will serve a multitude of purposes, among them being the conveying of coke and metal to the cupolas, the delivery of sand to the large storage pit and the transferring of patterns to the projecting platforms that extend into the main foundry building. The traveling cranes carry the patterns from these projecting platforms and place them on the molding floor.

The machine shop contains no equipment uncommon to a plant of this kind except a 42-in. milling machine with four heads, designed especially to mill bed plates for rolling mills. The machine shop is served by two overhead electric traveling cranes of 25 ton and 50 ton capacity, respectively. The entire plant is practically self-contained for, in addition to the foundry and machine shop mentioned above, the following adjuncts are in use: An extensive laboratory, a large pattern

All of the Air Furnaces Burn Coal and Are Stoker-Fired. Nos. 3 and 4 furnaces, respectively of 15-ton and 25-ton capacity per heat, are shown here. The large coal hoppers appear in the upper part of the picture

shop, an immense roll turning and grinding shop, as well as consulting, engineering and designing departments. The thoroughly equipped departments have facilities for turning out mills and rolls from 8-in. in

diameter tin foil mills to 44-in. diameter steel plate mills. At one time there could be seen on the erecting floor separate mills for the rolling of aluminum, brass, copper, lead, steel and zinc.

Bad Year for Machinery Exports

But J. W. Hook of Allied Machinery Co. Says its 1921 Business Was 40 Per Cent of That Done in 1920

"EXPORT machinery trade is bad, but whether it is much worse than domestic machinery trade at present is doubtful," said J. W. Hook, president Allied Machinery Co. of America, to a representative of THE IRON AGE. "Our reports for November and December are not all in, but I believe I am safe in saying that my company, which sells only in foreign markets and confines its efforts to American machinery exclusively, booked about 40 per cent as much business in 1921 as in 1920. Japan and France yielded the greatest portion of this volume. Belgium, England and Italy dropped back the most.

"There are two great obstacles in the way of selling machinery abroad at present. Exchange depreciation is one of them and it affects almost the entire world except Japan. German competition is the other and it is beginning to affect seriously the European and South American markets. These obstacles, when coupled with the surplus and distressed stocks of machinery in all countries, and the low buying power of everybody because of the depression, offer a resistance to the sale of American machinery that is indeed formidable.

"I am so tired of reading and hearing about 'conditions' that I've about come to the conclusion that there are none. I have sold goods for the past 18 years and there have always been conditions and obstacles and difficulties and even impossibilities. The thing that counts is one's ability to succeed despite conditions, and this is what we must all steel ourselves to do.

"If German competition is demoralizing for the moment, let us remember that it cannot remain so always. One of these days, not so distressingly far off, their prices must advance and, provided we have held our markets in the meantime, we will give them a merry chase.

"As for the exchange problem, it would be hard to find a more perfect way to show the people of the world the need for more production than by depreciated exchanges. Production is the only natural way to correct

exchanges, and production means a demand for machinery as well as for every other essential.

"The thing to do now is to protect our markets by getting a share of the foreign machinery orders even though it may cost us some money to do it. We certainly can afford to spend or lose more money than Germany, and some day those markets across the water will be indispensable to us. I have supreme faith in our foreign markets. I believe the world will demand an increasing amount of the goods we produce. I think this applies particularly to machinery, which is the converter that takes raw and worthless material and transforms it into useful and necessary merchandise. This thought alone is enough for anyone except the most confirmed skeptic. Suppose we forget about conditions and go after orders."

New England Iron League Dinner

Approximately 70 persons attended the 1921 annual dinner of the New England Iron League, which was held Thursday evening, Dec. 29, at the Boston Athletic Association. It was one of the most entertaining annual affairs ever before held by the league. Credit is due Charles H. Carter, Midvale-Cambria Co., chairman; Harold L. Stevens, Lackawanna Steel Co.; and John G. Andrews, president Boston Bridge Works, who constituted the dinner and entertainment committee.

Among those who sat at table with R. B. Wallace, Bethlehem Steel Co., dictator of the league, were M. Congdon, Congdon & Carpenter Co., Providence, R. I.; H. W. Hayes, Midvale-Cambria Co.; W. S. Locke, Carnegie Steel Co.; and E. P. Sanderson, E. P. Sanderson Co., Cambridge, Mass.

No speechmaking followed the dinner, that part of the evening being reserved for vaudeville entertainment and moving pictures.

Production and Yield of Rolling Mills

Their Present State of Development—Some Useful Operating Data—Losses Which Should Be Lessened—European Practice Leads in Yield

BY JOSEPH F. SHADGEN*

THE acute reaction and severe setback now affecting the whole business world have brought into the limelight the overshadowing importance of low cost of production in every branch of industry. Sudden or progressive reductions of selling prices, constantly shrinking margins of profit, have forcibly drawn the attention of all interested to the various factors that make up the cost of production. Economy has become the watchword in every enterprise, and efficiency the remedy, for salvation.

The iron and steel industry did not escape this universal readjustment, and had to carry a heavy burden during the shifting of economic conditions. Yet it is remarkable to notice the complete absence of discussion, even of reference, in the trade press, to the actual difficulties confronting the managers of the various plants. While selling prices are mentioned everywhere, the problem of production costs is rarely mentioned, although the close relation that links the two is obvious. No industry can neglect the one without detriment to the other.

In the light of present experience, the extravagance of recent years is bitterly paid for by many enterprises not prepared for the unprecedented slump in production. A detailed study of the cost of produc-

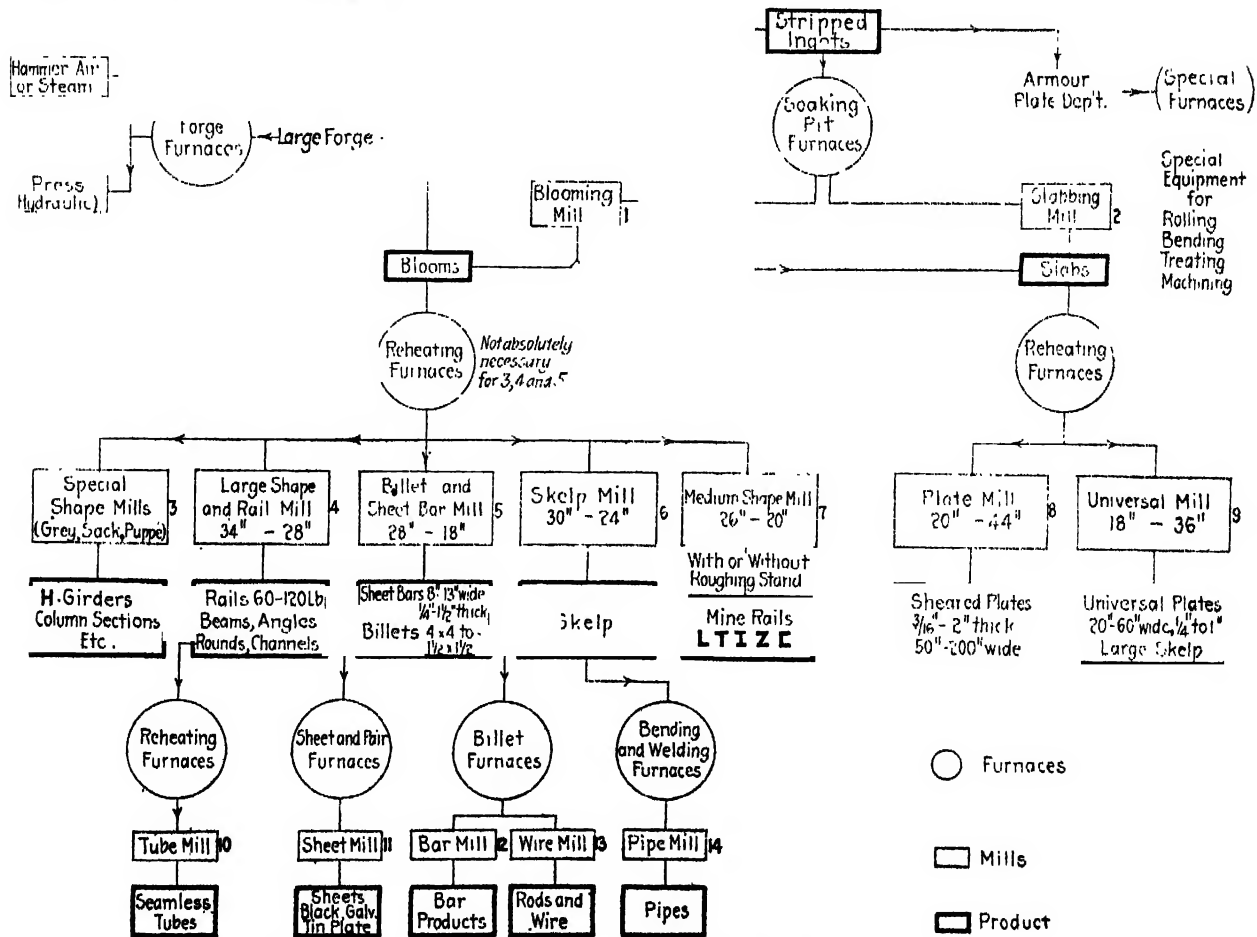

*Consulting engineer, New York.

†From the clash of ideas springs the light.

tion seems therefore most timely in order to show the relative values of the various component factors, and to enable the individual operator to compare his results with the general averages obtained elsewhere. These lines, in attempting to present these results from the modern rolling mill, represent an effort to fill a long-felt gap in technical literature. Far from being didactic, the analysis presented should form the basis of a discussion for the common good of the entire industry. Criticism therefore will be welcome as a co-operative reaction of the reader's mind. The author's attitude is clearly reflected by the French proverb: "Du choc des idées jaillit la lumière."⁴

While the practical application of the rolling mill process is the outgrowth of a century of experience, standardization is the main feature of the art today. The period of development may be considered past, and no startling novelties are to be expected. But we have ahead of us a period of crystallization characterized by the study of details, of problems of which the proper sequence of grooving of the rolls is the most important.

Starting from the ingots cast in the steel plant, the sections are progressively reduced on various rolling mills built especially for each purpose, and equipped with accessories that permit quick handling in large tonnages. The accompanying chart is a flow sheet of the modern rolling mill, showing the accepted spe-

Flow Sheet Showing Progress of Steel from the Ingot to Final Product

cialization of the industry of today. Recent descriptions of modern installations are familiar to the readers of *THE IRON AGE*, which can be usefully consulted in conjunction with this study. Special reference is made to:

Future of To-day's Developments

The practically universal application of electricity as motive power for cranes and the majority of auxiliaries, and for lighting, places its economic superiority beyond the shadow of doubt. For main mill drives, opinions vary between reciprocating steam engines and electric motors, with a decided leaning toward the electric medium. Generalities on this detail problem are not only futile but deceptive; individual study of local conditions, only can do justice to the problem. Technical literature is full of the controversy of motor versus steam engine, and there is still keen competition between these two prime movers. But it is precisely this struggle for supremacy which is responsible for the great progress and improvements realized in the last fifteen years. Electricity has won in most fields, but has found in the steam engine (especially of the uniflow type) a stubborn competitor, able to hold its own under certain circumstances, and we are not yet at the end of the story.

Blooming mills built as large reversing units are of especial interest. Of the new installations built lately in America, Weirton (1920) remains practically the only, but decided, partisan of the steam engine drive; not forgetting the large plate mill of Lukens (1917) and the Grey mill drives (1915) of Bethlehem. But electric motors in conjunction with motor-generator-flywheel sets were installed in Bethlehem, Sparrows Point, Inland, Mark Mfg. Co., Tata, Trumbull, etc., and some interesting replacements of old engines by motors, such as Lackawanna, Steelton and Atlanta, merit special notice.

The superior economic operation of the electric drive is an incontestable fact, but the high cost of first installation creates financial burdens that counteract, at least partly, this advantage. Progress lies in the direction of finding less costly electric devices, of equal efficiency. In Europe, steps have been taken in that direction, and the results will merit close watching.

For smaller drives, of the continuous-running type of rolling mill, electric motors prevail in the majority of new installations, although several large uniflow steam engines were installed in the Pittsburgh and Youngstown districts, on new mills or replacing old drives.

The second outstanding characteristic of the present day development is the increasing automaticity of all auxiliaries (largely made possible by the adaptability of individual motor drives) reducing the labor factor to a minimum. On all big mills manual skill is really superseded by mechanisms of marked dexterity. This tendency explains also the supremacy of the continuous mill principle, originated by Morgan, over the odd and ingenious solution of the billet and sheet bar mills of a decade ago. If the tonnage is large enough, there is today no doubt about their advantages; even in the European plants, where lower production tonnages

prevail, continuous roughing mills have gained favor, in combination installations, with two or three finishing trains.

Reversible Versus Continuous Running

Actual comparisons of costs of production showed the desirability of greater specialization of the blooming mill; this was done by narrowing the range of its finished product. While in 1900 a 20 sq. in. section was commonly rolled on reversing mills, in 1910 the standard bloom section averaged 35 sq. in., and today it has reached 60 sq. in. In other words, while in 1910, 4 x 4-in. billets were produced on blooming mills, today's experience teaches that the most economical bloom sections are 8 x 8 in. or 8 x 7 in., and all recent large installations have been laid out accordingly.

This means that the large mills of the reversible type have proved to be the most economical for roughing down ingots of short length, on account of the slow speed of rolling, quick gripping of the material and because of the elastic adaptability of the modern reversing drives to create, at will, conditions best suited for superior results. Modern blooming mills are therefore extremely powerful—for example, the Inland or Sparrows Point installations, which are fed by large ingots that are knocked down into blooms or slabs in tonnages over 50,000 monthly (600,000 tons per year).

Accumulated experience of modern reversing drives, adapted with great success to universal plate mills, has created new standards of operating economy and new records in quantity production. Further immediate developments in the plate mill field will be handicapped by the extraordinary expansion (rather overexpansion) caused by the war necessities and the shipping policy—conditions that will practically prevent new construction in that particular field for some years to come.

Cost of Production

While the factors entering into the cost of producing rolled shapes are known, and are similar in most plants, their relative values may vary considerably, according to geographic location and economic conditions. In last analysis, the experts have subdivided the cost into two items: (a) operating cost, (b) overhead expense. Operating costs are under the direct control of the plant management, and are made up of six factors: Fuel, power, material yield, labor, maintenance, miscellaneous.

Overhead expense is a general term familiar to accounting departments. It includes all financial burdens due to capital investment, insurance against obsolescence, interest on investment, sinking funds, etc. All these factors are specific to each company, and beyond the horizon of the operator of the plant. They are closely connected with taxation problems and questions of finance and market conditions, and they may be considered outside the scope of a technical discussion, although a greater uniformity as to their conception and application is highly desirable for the good of the industry as a whole.

To the practical operator, the tangible factors making up his various cost items are most important. Comparable figures between plants are easily obtainable, because they reflect material things specific to the rolling mill operation.

Operating Costs in Terms of Fuel

If rolling mills adjoin the steel plants, the ingots are usually rolled out hot without losing their initial heat. This is economically possible through modern soaking pits. These furnaces may be heated by an outside source to balance a possible deficiency of B. t. u., or simply consist in well-insulated holes that equalize the temperature balance of the freshly stripped ingots. Reheating furnaces are built for blooms, slabs,

billets and rods, and use fuel in the form of coal on grates or stokers, producer gas, oil, powdered coal, coke oven gas or natural gas.

To heat 100 lb. of iron or steel to 2300 deg. Fahr. rolling temperature, roughly 40,000 B. t. u. are required, equivalent to about 3 lb. of coal of 13,500 B. t. u. per lb., or 0.27 gal. of oil of 150,000 B. t. u. per gal., or 80 cu. ft. of coke oven gas of 500 B. t. u. per cu. ft. or 300 cu. ft. of producer gas at 135 B. t. u. per cu. ft.

Most of the soaking pits in America are of the heated regenerative type, and use either rich or lean gas. Under careful operation they should use not more than 2 to 3 lb. of coal per 100 lb. of steel heated, including the fuel needed during Sunday, when the furnaces have to be kept hot. The soaking time, varying with the ingot section, averages 1 to 2 hr. when hot ingots are fed, and 2 to 3 hr. when cold ingots are handled.

Reheating furnaces are built either in the form of regenerative side-door furnaces for slabs, large blooms, etc., or continuous heating furnaces (pushing type) for blooms and billets. Regenerative reheating furnaces have recorded 9 to 11 lb. of coal per 100 lb. of steel blooms or slabs, and modern continuous furnaces should easily better this performance, with proper flame control.

Billet furnaces built to reheat 1½-in. billets, 30 ft. long, for continuous mills, have averaged 5 to 6 lb. of coal per 100 lb. of steel, in spite of the transformation loss in the gas producer, and reached a production of 200 tons in 12 hr. Continuous annealing furnaces have been built to consume less than 7 lb. of coal per 100 lb. of steel, and have attained 6.25 lb. as a monthly average (producer gas fired).

Sheet mills, with their various reheating operations and annealing, should not require over 22 lb. of coal per 100 lb. of sheet bars, as some well managed plants have averaged 15 to 18 lb. over long periods. These figures can easily be bettered with proper care, and the application of recent progress in heating science and the present slump in production should be used for improvements in that respect, to stop the great waste of heat, and take advantage of the economies of modern devices. Here is the greatest field of endeavor for the alert operator to reduce his costs.

The achievements above quoted will certainly lead to some searching comparisons. With natural gas still greater economies are possible, but they have seldom been attained, as no refinements existed in the past era of low fuel cost; but the hard necessities of today will forcefully bring these problems into prominence.

Special attention should be drawn here to the importance of proper temperature of the steel to be rolled. The highest steel temperature compatible with the quality of the material should be used, as the classic investigation of Puppe has shown that 1 kilogrammeter displaces at 1300 deg. C., 90 ccm.; at 1200 deg., 45 ccm.; at 1100 deg., 30 ccm.; at 950 deg., only 20 ccm.; a reduction of 78 per cent in a 350 deg. drop of temperature.* The influence of proper heating appliances on power costs is therefore conclusively demonstrated, and it is unfortunate that these data have not received adequate attention and consistent application every day in the shop or mill.

The cost of fuel is not only the value of the coal consumed; it includes also the handling and transformation charges of the heat into the form of ultimate utilization, which usually involves labor, power and maintenance, as in the case of a producer house or a pulverization station. Besides that, gasification, including the loss of heat, brings a total charge of

60c. or \$1 per ton of coal, according to local conditions, while pulverization will be taken care of by a surplus of 30 to 70c. per ton, varying with the size of the plant. Modern oil installations are practically automatic in their operation, and necessitate very little overcharge, while the rich gases are delivered at such pressures that practically no additional cost is involved.

In large rolling mill installations, working a sequence of trains, the ingots may be rolled in one heat down to 1½ x 1½ in., or 8 x ¾ in., if continuous mills, are used in conjunction with the blooming mill, but it is not safe to figure on that performance. Shapes down to 3 or 4 sq. in. cross section (10 to 14 lb. per ft.) are also rolled in one heat, although it is customary to figure on reheating, intermediately, about one-third or one-fourth of the tonnage. Smaller shapes and bars are made from blooms or billets that are all reheated. In Europe the tendency is to standardize on 4 x 4 and 6 x 6 in. billets up to 6 ft. long, and reheating furnaces of the continuous type are commonly built for those sections. Figures for oxidation, covering various plants over years of operation, are given later.

Power Consumption in Rolling

The importance of the power cost cannot be overestimated; to give simple and comparable figures only electrical drives are considered, and only the number of kilowatt-hours per ton rolled are given, as it is impossible to go into specific details in a perspective study.

1.—Large blooming mill, with 36 to 40-in. pinion diameter, driven by 5000-hp. motors, under Ilgner system control, guaranteed to roll 45,000 to 60,000 tons of ingots monthly (24 x 24 in. of 9100 lb. and 28 x 39 in. of 18,000 lb.) to 8 to 12 elongations, average 10; and standard bloom 8 x 8 in.

Average main drive per ton of ingots.....	16 kw/hr.
All auxiliaries plus cranes plus shear.....	4 kw/hr.
Total per ton of ingots.....	20 kw/hr.

2.—Medium size blooming mill, with 30 to 35-in. pinion diameter, driven by 4000-hp. motors, Ilgner system, guaranteed to roll from 30,000 to 45,000 tons of ingots monthly (20 x 22 in. of 6800 lb. and 25 x 25 in. of 11,500 lb.) to 10 to 18 elongations, average 14, and standard bloom 6 x 6 in.

Average main drive per ton of ingots.....	20 kw/hr.
Auxiliaries.....	6 kw/hr.
Total per ton of ingots.....	26 kw/hr.

3.—Small blooming mill (roughing or billet mill) with 24 to 30-in. pinions, driven by 3000-hp. motors, Ilgner system, guaranteed to roll 20,000 to 30,000 tons of ingots or blooms per month (18 x 20 in. of 5500 lb. or 12 x 12 in.); elongations 12 to 25; average 20; standard output, 4 x 4 in.

Average main drive per ton of ingots.....	25 kw/hr.
Auxiliaries.....	8 kw/hr.
Total per ton of ingots.....	33 kw/hr.

4.—Large shape mill (continuous running, three-high type in America; reversing two-high type, in Europe), 30 to 60 tons per hr. according to layout; rolling rails, beams, etc., from blooms 8 x 8 in. to 12 x 12 in. or larger; roll diameter, 28 to 34 in.

Rails, average of mill, per ton of blooms.....	35 kw/hr.
Beams, shapes, etc., per ton.....	40 kw/hr.
Auxiliaries.....	8 kw/hr.

Total for rails.....	43 to 45 kw/hr.
Total for beams, etc.....	48 to 50 kw/hr.

5.—Large plate mill, 110 in. and upward, two-high or three-high, large tonnage, 15,000 tons or more per month, well equipped and with sufficient furnaces and large cooling beds.

Main drive, per ton of slabs.....	20 to 25 kw/hr.
Auxiliaries.....	15 to 20 kw/hr.

Total per ton of slabs.....	35 to 45 kw/hr.
-----------------------------	-----------------

6.—Small plate mill (either three-high or two-high

*An effort represented by 7¼ ft. lb., on steel at 2375 deg. Fahr., displaces 5.5 cu. in.; at 2200 deg. Fahr., 2.75 cu. in.; at 2015 deg. Fahr., 1.83 cu. in.; at 1750 deg. Fahr., only 1.22 cu. in.

universal), 12,000 to 20,000 tons per month; good auxiliaries.

Main drive, per ton of slabs..... 25 to 35 kwhr.
Auxiliaries..... 20 to 25 kwhr.

Total per ton of slabs..... 40 to 60 kwhr.

7.—Continuous Morgan mill 4 stands, 21 in. and 6 stands, 18 in.), 15,000 to 20,000 tons per month; one or two separate motors; taking 7 x 7-in. or 6 x 8-in. material and producing 1½ x 1½-in. billets or 8 x ¾-in. sheet bar.

Roll drive, per ton of blooms..... 20 to 22 kwhr.
Auxiliaries..... 2 to 4 kwhr.

Total per ton of blooms..... 22 to 26 kwhr.

8.—Billet mill or medium shape mill (rolls 18 in. to 24 in., one to four stands).

4 x 4 in. to 1½ x 1½ (10,000 tons monthly),
per ton of blooms..... 26 kwhr

4 x 4 in. or 7½ x 1½ in. to shapes (6000 tons
monthly)..... 55 kwhr

10 x 10 in. to 4 x 4 in. (6000 tons monthly)
7 x 6 in. to 7 x ¾ in. sheet bars..... 38 kwhr

Auxiliaries..... 44 kwhr

Total per ton of blooms..... 10 to 20 kwhr

35 to 60 kwhr

9. Bar and rod mills less than 18 in. in diameter:

(a) Belgian mill, 4 stands of 16-in. and 3 of 12-in.,
1 drive, monthly average 6000 tons; maximum
billet, 5 x 5 in.

Main drive..... 60 kwhr.
Auxiliaries..... 15 kwhr.

Total..... 75 kwhr.

(b) 10-in. continuous mill; 6 passes; 5000 tons
monthly; 1½ x 1½ in. to 0.5 x 0.5 in. or 0.4 x
0.4 in.

Main drive..... 54 to 56 kwhr.

Auxiliaries..... 2 to 3 kwhr

Total..... 56 to 61 kwhr

(c) Rod mill, 10 passes continuous, 6 on Belgian
stands; No. 5 rod; 5000 to 6000 tons per
month.

Main drive..... 100 kwhr

Auxiliaries..... 15 kwhr.

Total..... 115 kwhr.

(d) Bar mill, two continuous stands, three finish-
ing trains; 5 x 5 in. to all kinds of finished
sections; 5000 to 8000 tons per month.

Mill drives, per ton of billets..... 100 kwhr

Auxiliaries..... 12 kwhr.

Total..... 112 kwhr

Determined by tests:

180 to 67 sq mm (28 to 10½ sq in.), per ton..... 23 kwhr

67 to 20 sq mm (10½ to 3½ sq in.)..... 37 kwhr

20 to 14 sq mm (3½ to 2.2 sq in.)..... 58 kwhr

(e) Wire mill, continuous type all through; 1½ in.
to No. 5 rods.

Mill drives, per ton..... 120 kwhr

Auxiliaries..... 8 kwhr

Total..... 128 kwhr.

10.—Sheet mills (24 to 30 in. diameter, 6 to 10
stands; 30 x 7 x ¾ in. to sheets of 0.01 to 0.09 in. in
thickness).

Mill drives, per ton of sheet bars..... 105 to 125 kwhr.

Auxiliaries..... 10 to 12 kwhr

Total..... 115 to 137 kwhr.

These data can be substantiated by numerous concrete figures in international technical literature. As a year's average, certain plants show an energy consumption of 175 kwhr. per ton of ingots in reducing from ingots to wire, and below 200 kwhr. per ton of finished product. The figures covered the tonnage rolled and not the amount of finished product, for reasons yet to be discussed.

The net power cost includes, of course, a further amount for labor, material, etc., but the power as represented by the electric energy makes up over 85 per cent, and usually 90 per cent, of the whole item, as shown by figures of numerous mills over years of operation.

(To be concluded)

CAR ORDERS AT LOW POINT

Total for 1921 Was 20,667—Locomotive
Buying Also at Minimum

Figures compiled by the *Railway Age* show that additions to rolling stock represented in orders placed in 1921 were the smallest since these statistics began to be kept. Only 20,667 freight cars were ordered last year. The smallest previous number was in 1919, when it was 25,899. During the five-year period ending with 1917 the number of freight cars averaged 108,000 a year, or more than five times the 1921 number. Freight cars actually built for all railroads in the United States in 1921 were 40,354, the smallest number before this year being 60,955 in 1920.

In 1921 only 241 new locomotives were ordered for domestic service, the smallest previous number being 272 in 1919. The number of locomotives ordered in the five years ending with 1917 was considered small at the time, but it averaged about 2,400 a year, or ten times as much as the orders placed in 1921. Locomotives actually built in 1921 numbered 1,121, the smallest number built in any year since 1897.

During the year railroad mileage declined about 1,200 miles. About 475 miles of new track was built, the smallest known except in 1920, when it was 314 miles. Mileage abandoned during the twelve months was 1678 miles, the largest ever known. The net decrease of 1200 miles of track is the largest on record. In the five years between 1917 and 1921 more than 5700 miles of road have been abandoned, while only 3200 miles have been built, making a net decline in trackage in five years of 2500 miles.

Better Business Expected in Valley

Youngstown, Jan. 3.—While buying is inactive for the moment in the Mahoning Valley, makers generally are hopeful that the first quarter will develop considerable new tonnage in the aggregate. Business in January is expected to be somewhat sporadic, in the opinion of a leading sales executive, who looks, however, for some betterment commencing with Feb. 1. Improved buying is expected to be particularly felt in the lighter steel products, such as sheets, tinplate, plates, strips, bars and angles. Sustained demand for such products from the automobile industry is anticipated, in view of the fact that many warehouses in the Detroit district have largely depleted and unbalanced stocks.

Inquiries from larger jobbing interests are making their appearance, and buying from this source is expected to produce considerable tonnage during the next few months. Price unsettlements have acted as a retardant, but there is a more determined effort on the part of producers to stabilize the market. Efforts in this respect have been temporarily successful, at least, in the sheet market. Gross volume of sheet buying in the first quarter is likely to be less than during the last quarter of 1921, and it is unlikely that schedules in this branch of the industry will swing back to the 80 per cent mark reached last October, until in the spring. One of the leading interests, which has consistently maintained normal production in its sheet department, is now curtailing; another is operating its (preponderant) sheets capacity, in negligible volume.

Though basic pig iron was recently sold in the Valley at \$18.25, steelworks interests are endeavoring to establish a minimum market of \$19. Merchant furnaces are largely out of blast. Open-hearth sheet bars are stabilized at \$30. Valley makers are holding plate prices to a 1.50c minimum, but have been at a disadvantage with producers in Eastern territory owing to certain freight rate inequalities. Strip steel business is being accepted on the basis of 2c for hot strip and 3.75c for cold rolled. Tin plate is firmly maintained at \$4.75, for the time being, but a lower price on long-time contracts is not considered unlikely. The leading independent maker of wire products is quoting the new prices recently announced by the leading interests, of \$38 for wire rods, \$2.25 for plain wire per 100 lb. and \$2.50 for nails per base keg.

Steel Plant Installed for Sheet Mill

Mansfield Sheet & Tin Plate Company's New Steel Unit Provides Sheet Bars from Bottom-Poured Open-Hearth Ingots

BY CARL W. PEIRCE*

ABOUT seven years ago the old National Rolling Mills Co., at Mansfield, Ohio, was taken over by W. H. Davey and his seven brothers, all practical sheet mill men. The plant was remodeled, and in two months was engaged in the manufacture of steel sheets under the name of the Mansfield Sheet & Tin Plate Co. The old plant, which consisted of three hot mills, housed in a building 67x140 ft., had operated only for a few months.

From time to time, additions have been made to the old plant, so that to-day the building is 167 ft. wide by 940 ft. long, and houses seven tin mills with their accompanying equipment.

Early in 1917 ground was broken for a new sheet mill unit, which is located south of the old plant and on the other side of the Pennsylvania Railroad tracks, between the railroad and Bowman Street. This plant, mainly for the manufacture of high polished sheets, was designed and built under the supervision of Austin Davey, chief engineer of the company. The building, which houses twelve sheet mills with their pickling, annealing and cold roll departments, is 226 ft. wide by 1039 ft. long. This plant was put into operation in the fall of 1919.

On account of its inability to get a satisfactory delivery of sheet bars, the company in the fall of 1919 began to consider the advisability of building its own steel making unit. A piece of land lying between the Baltimore & Ohio and Pennsylvania railroads, and adjoining the company's property, was occupied by two hills which it was necessary to remove. This site was selected on account of its railroad connections and its proximity to the other two parts of the plant.

In March, 1920, the Fred R. Jones Construction Co. started to prepare the site for a steel unit large enough to produce what bars the sheet and tin mills would consume, and the work of designing the unit was begun. This work was done by F. A. Davey, chief engineer, with Frank I. Ellis, Pittsburgh, as consulting engineer.

Plans were drawn for an open-hearth department,

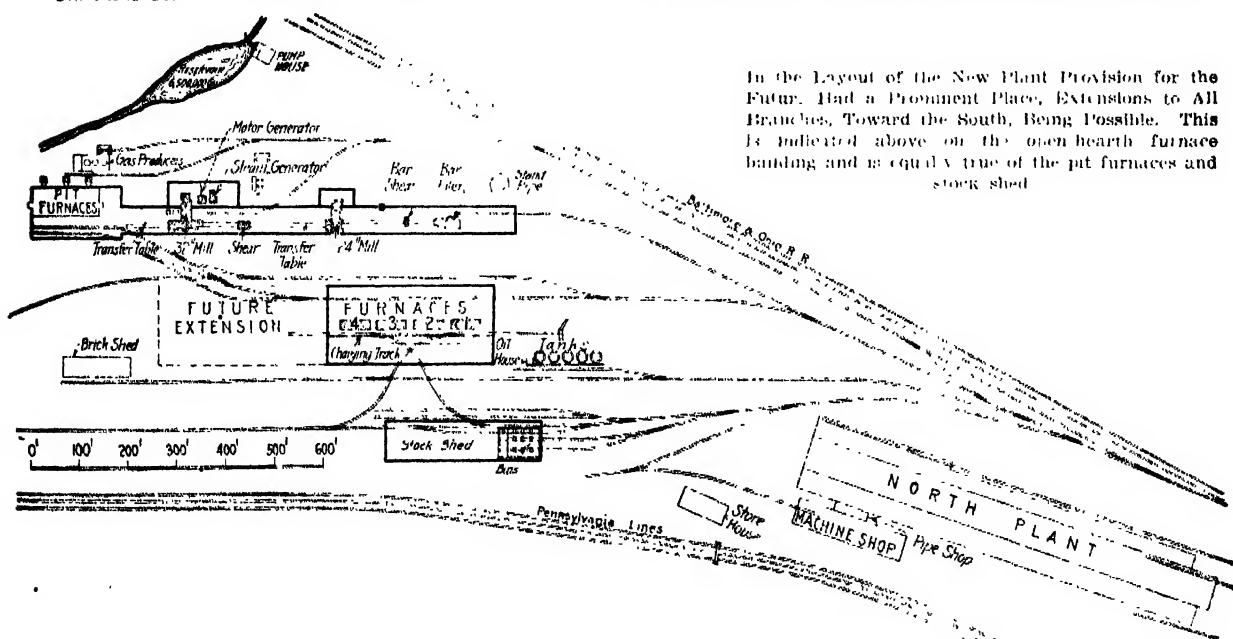

*Open-hearth superintendent, Mansfield (Ohio) Sheet & Tin Plate Co.

with four 80-ton furnaces and covered stock house, and a rolling mill department consisting of soaking pits, a 32-in. mill for breaking down the ingots and a 24-in. sheet bar mill. On account of the product of the mills being mainly highly polished sheets, it was held desirable that the steel should be poured by the bottom-case method, in order to guarantee a high grade sheet bar. The general layout plan shows the relation of the steel plant to the tin mills, and of the open-hearth and rolling mill units, indicating in dotted line the future furnace extension.

In view of the peculiar shape of the land, it was early decided to leave a part of the hill on the west side of the property, and to place the stock yard upon it, bringing it on a level with the open-hearth charging floor and parallel to that building. In making the crossovers from the stock yard to the open-hearth building, a new arrangement has been used. Instead of pulling out from the ends of the stock-yard and entering the charging floor at the ends, a double crossover track extends from each end of the stock yard and crosses to the opposite end of the charging floor, the crossovers connecting with the furnace track between furnaces Nos. 1 and 2 and between Nos. 3 and 4.

The advantage of this layout is that the stock yard engine is able to deliver a drag of loaded pans onto the furnace track over one crossover, and then to back down the floor and remove the empty pan cars to the stock house over the other crossover, performing the two functions by the one shift. By this arrangement, too, it is impossible to have a furnace blocked from charging because another furnace between it and the stockhouse inlet is being charged, as the second charge can come in over the other crossover.

The buildings, furnished by the McClintic-Marshall Co., are of strong, sturdy construction in keeping with the other equipment of the plant. In the stock yard building, which is 77 ft. wide by 300 ft. long, is a 20-ton crane for loading the charges. The first two bays at the south end of this building are occupied by large concrete bins for the storage of limestone, raw dolomite and iron ore. Two tracks run through the east side of the building. The one nearest the open-hearth build-

Bar Mill Building from the East, with Soaking Pit and Gas House Buildings at Rear. In the center foreground may be seen the lower section of 300,000-gal. standpipe under erection

ing is used for loading the charging pans, and is on a level with the charging floor; the other track used for loading is 4 ft. lower. This arrangement brings the tops of the gondola cars of scrap and the charging pans on the same level. This latter track, being 4 ft. lower than the loading track, decreases by this amount the grade of the track leading from the mill level into the stockhouse.

On the brow of the hill outside the stockhouse, and between it and the open-hearth building, are two tracks, one being used as a storage track. The other, nearest the stockhouse, is a run-around track in going from one end of the stockhouse to the other. A 75-ton two-section scale, with self-indicating weightograph attachment furnished by the Buffalo Scale Co., and located on the loading track midway between the crossovers, will weigh all charges. A 150-ton, 4-section railroad track scale, furnished by the same company, is located in the yard between the north plant and the Baltimore & Ohio Railroad.

Charging pan and ingot cars, furnished by the Pittsburgh Steel Foundry Co., are of skeleton steel casting type, equipped with Hyatt roller bearings and with a patent coupling device designed by the foundry company. These cars, in addition to all mill cranes and run out tables, will be lubricated by the Adkins lubricating system.

Between the stock yard and open-hearth buildings, and just outside the valve cellar wall of the open-hearth, is a depressed track to allow for passage of cars under the crossover tracks leading from the stockhouse to the open-hearth department. Space has been left on the mill level between the depressed track and the stockhouse for a future installation of gas producers. The depressed track also permits the wheeling of dirt directly onto the cars, when the furnace regenerators are cleaned, or for the removal of ashes from the gas producers.

The open-hearth building, housing the four 80-ton furnaces, is 360 ft. long, with a pouring aisle 65 ft. wide and a 25-ft. leanto over the valve cellar. The charging floor, which is 16 ft. above mill level, has its furnace track 6 ft. 6 in. center from the front of the furnaces, permitting the passage of standard gage

cars over it. This arrangement permits the dumping of iron ore and limestone through the tail trestles at each end of the charging floor, and will permit the unloading of a car of brick at a furnace under repairs.

The 80-ton open-hearth furnaces, which are being built by S. R. Smythe & Co., Pittsburgh engineers and furnace builders, are at 80-ft. centers in the building. They are 65 ft. 3 in. long over the brick-work, having a hearth 15 ft. x 35 ft. x 5 ft. deep. They have been designed to burn either oil or natural gas as fuel. They will be started out on oil, five 100,000-gal. tanks having been provided for oil storage. Each furnace hearth is supported upon two piers 8 ft. 7½ in. x 17 ft. 7½ in. x 15 ft. 3¼ in. high, placed 19 ft. apart. These piers are made of 18 in. of wire-cut brick on the outside, and the center filled with concrete. On these piers are placed ten 20-in., 80-lb. beams with 12-in. cross channels, the channels forming the bottom of the pan upon which the hearth is built. The chills at the end of the hearth are made of plates and angles properly braced.

Buckstays supporting the hearth and roof are made of 15-in. beams and channels, the latter reinforced by 1-in. plates riveted to them. The front and back of the furnace pan between the buckstays is made of heavy iron castings properly ribbed. The door castings are designed with the front corner cut away, for the installation of a 4-in. water line to care for the waste water from the doors, this arrangement providing for a very short connection from the door to the telescope pipe.

Port-ends and regenerators are bound with 12-in. beams and channels properly reinforced. The furnace regenerators are 22 ft. 10½ in. long and 9 ft. high from the top of the rider walls to the square of the arch, the gas chambers being 7 ft. 1½ in. and the air chambers 12 ft. 10½ in. wide, with a 3-ft. wall between them. The flues leading from the regenerators to the valves are of the standard design for 36-in. gas and 42-in. air valves, of Blair Engineering Co. design, with which the furnaces are equipped. Waste heat boilers, of 500 h.p. each, built by the Erie City Iron Works, Erie, Pa., have been installed on furnaces Nos. 3 and 4, for utilizing the heat from the waste gases from

General View of New Plant from North, with Stock House at Left, Open-Hearth Building in Center and Bar Mill Building at Right. In foreground are five oil-storage tanks. The difference in level between the two as yet ungraded tracks in the stock house is apparent

the furnaces, 60-in. Blair valves making the connections between the furnaces, the boilers and the stacks. Mechanical draft for the boilers is furnished by 7 ft. 6 in. Sturtevant fans driven by steam turbines. The fans and turbines are located on the leanto floor adjoining the boilers.

Each furnace has five electrically operated charging doors of the Knox water-cooled type, the middle door opening being 48 in. wide x 45 in. high, the others being 42 in. x 42 in. The motors and drums controlling these doors are located on platforms underneath the charging floor, and just back of the regenerators.

A 5-ton high type charging machine of Alliance Machine Co. make, with track span of 14 ft. 6 in., has been installed. This machine is designed with a 2-foot clearance between the charging rails and the lower framework of the machine. The furnace aisle has been designed for the future installation of an overhead crane.

The charging floor between the furnaces slopes gradually to the platform behind the furnaces, which is on a level with the tapping hole platforms. Six-ton electric jib-cranes furnished by the Pittsburgh Crane & Equipment Co. are at the back of each furnace, for

having a capacity of 165 cu. ft., and placed on the floor alongside the ladles. After the slag is sufficiently cooled for transportation, the box with its contents is placed on a specially designed side dump car large enough to hold one slag chunk, the box is then stripped from the chunk, leaving the slag on the car ready for transportation to the slag dump. The small dirt will be handled in 12-yd. side dump cars. A grinding house with heavy duty 9-ft. pan is on the mill level, and joins the pouring aisle at the south end.

At the south end of the pouring aisle and at a level with the top of the crane girders is a repair platform, arrangements having been made for the future installation of a mono-rail and crane for serving cranes in both the charging and pouring aisles. An escape platform has been provided for the ladle crane operators above the pouring platform, and on a level with the crane cab, extending the entire length of the building. This platform has a runway outside the building, with steps leading to the ground, to allow operators to escape in case of a bad spill.

From the pouring aisle, the ingots are taken to the soaking-pit building, which with the mill building lies to the east of the open-hearth department and

Looking into the Bar Mill Building from the Soaking Pits, with 32-in. Mill in Central Foreground and Motor House at the Left. Beyond the mill are the 8 x 8-in. Mesta shear and the 24-in. Slick sheet bar mill

the removal of the tapping spouts, which are of the V-shaped steel casting type.

On account of the steel being poured by the bottom cast method, the pouring aisle is traversed by only one track, which will serve alike for the removal of ingots to the pits, slag, dirt, skulls, etc. Two pouring platforms are provided along the building columns on the east side of the building, on the floor in front of which are placed the pouring plates. These plates are 8 ft. 4 in. square and designed to permit the pouring of twelve 14 x 15 in. ingots from one fountain. Five plates will be required to handle the output of each heat, the two pouring platforms being long enough to accommodate twenty-five pouring plates. Between the two platforms is a hydraulic stripper for pushing out sticking ingots. This stripper is equipped with a motor driven pump, making it a self-contained unit. The 90-ton ladles, with sloping bottoms and the nozzle at the lowest point, were made by the Treadwell Construction Co., Midland, Pa.

The pouring aisle has a 125-ton main hoist ladle crane with a 25-ton auxiliary trolley, and a 5-ton stiff-leg crane of the soaking-pit type, both of Alliance Machine Co. make. The stiff-leg crane was designed to be able to strip molds from the ingot, twist the latter from the bottom roots, and pile on the cars for delivery to the soaking-pits, in addition to setting the molds back on the pouring plates. This method of handling bottom-poured ingots guarantees their delivery to the soaking pits as quickly as though they were top-poured.

Overflow of slag from the ladles will be caught in large steel casting boxes of the truncated pyramid type,

runs parallel to it. A space of 100 ft. separates the open-hearth and mill buildings. The soaking pit building, which is 192 ft. long by 77 ft. wide, and with a 20-ft. leanto over the valve cellar, houses three pit furnaces of four holes 5 ft. 6 in. x 8 ft. each, built by the Smythe Co. The arrangement of the pit holes is opposite to that of the usual design, the twelve holes being in line with the length of the building, the covers being designed to back into the leanto building when open, so as to be out of the way of possible damage from the crane.

This arrangement also permits the use of a tunnel running under the line of the twelve pits, which is served by track, slag cars and boxes. Between pits are openings for the removal of the slag boxes by the crane. The pit covers are operated by a special design of shaft driven by motor, with a separate clutch for each cover. By this arrangement one motor will operate the four covers of each furnace.

These furnaces are designed to operate without regenerating the gas, no checkers being placed in the gas chambers and all outgoing ashes passing through the air regenerators. The furnaces are very strongly reinforced with three sections of 20-in. beams with 9-in. vertical channels. The bottom structure of the pit holes consists of 2-in. cast iron plates resting on 12-in. beams. The valves are of the ordinary butterfly type. The stacks are self-supporting, and are 4 ft. 6 in. in diameter and 120 ft. high.

At the east of the soaking pits and at the rear of the stacks is a gas producer building, housing three 10 ft. 6 in. stationary producers equipped with direct

Lower End of the Open-Hearth Building, from Stock House Scales, with Stacks of Nos. 3 and 4 Furnaces and Two Waste-Heat Boilers. One of the crossovers from stock house to open-hearth building appears in foreground between stacks, while the stacks of the soaking pit furnaces are at extreme left

drive Chapman agitators built by the Chapman Engineering Co., Mt. Vernon, Ohio, which will furnish gas for heating the ingots. Over each producer is a large steel coal hopper of 50-ton capacity, served by a 5-ton Northern crane and grab bucket. The coal is delivered to the gas producers over a trestle, from which it is dumped into a hopper, crushed and conveyed to a bin under the gas producer crane. The single roll crusher and belt conveyor were built by the Webster Co., Tiffin, Ohio. Between the soaking-pit stacks and the gas-house cellar is a depressed track, which permits the wheeling of ashes directly onto a side dump car.

In the soaking pit building and to the west of the pits are three tracks, the two on the outside for the delivery of ingots from the open-hearth building, and the one nearest the pits for the ingot chariot. This building is served by a 5-ton standard type soaking pit Alliance Machine Co. crane. From the pits the ingots are carried by a motor driven chariot, built by the United Engineering Foundry Co., and delivered on the approach table leading to the 32-in. mill, which is of the 3-high type, built by Wm. Tod & Co., Youngstown, Ohio.

The General Electric motor driving this mill is 2000-hp., 240-rpm., 2200-volt., a.c.; the power passing through a 20-ton flywheel, a 5 to 1 reduction gear built by the Morgan Construction Co., then through the pinion housing to the rolls. The hydraulic lift tables are operated by an Aldrich 600-lb. pressure pump and accumulator, the table on the entering side being served by a manipulator car with fingers for turning the ingots.

The 14 x 15 in. ingots will be reduced in eleven passes, the last an edging pass, to $2\frac{1}{2}$ x $7\frac{3}{4}$ in. bars, after which they pass to an 8 x 8 in. motor driven Mesta shear, from which the cut bars pass to a 24-in.

Slick patent sheet bar mill, made by the United Engineering & Foundry Co. The runout tables between these mills, the rolls of which are equipped with Hyatt roller bearings, were made by the Woodard Machine Co., Wooster, Ohio, and lubricated by the Adkins system.

The General Electric 24-in. mill motor is a 2500-hp., 240-rpm., 2200-volt. a.c.; the power passing through a 40-ton flywheel, then through the reduction gear and pinions to a 3-high stand, in which the bars make four passes, being carried from the lower to the upper passes by a series of chutes which form the basis of the Slick patent. From the final pass in the 3-high mill the bars are shoved over to the final pass in the 2-high stand by a hydraulic arm. Both stands of rolls in this mill are in line and run by the one motor.

The bars, after leaving the 24-in. mill, are conveyed by pinch rolls and chutes to a 1 x 8 in. shear made by the Cleveland Punch & Shear Co. and from there to a Kennedy bar piler made by the United Engineering & Foundry Co. Ample cooling beds occupy the space between the bar piler and the end of the building. The mill building, 850 ft. long x 55 ft. wide, is served by a 25-ton and a 10-ton crane of Alliance Machine Co. make. The output of the mill unit, which will consist mainly of a high grade sheet bar for the manufacture of highly polished sheets, will be approximately 10,000 tons of bars per month.

In the 32-in. mill motor room have been installed a 600-kw. General Electric motor generator set and a 400-kw. steam generator set, to insure sufficient power to operate all cranes, in case power should be shut off by the outside source of supply.

Control on all cranes has been furnished by the Electric Controller & Mfg. Co., Cleveland, the general control by the Westinghouse Co.; all small motors and main switchboard by the Westinghouse Electric & Mfg.

Kennedy Bar Piler and 1 x 8-In. Shear Are in Foreground in the Bar Mill Building, with 24-In. Slick Sheet Bar Mill Toward Rear

Co. The yard work is served by a 20-ton, 50-ft. boom McMyler crane and a 40-ton saddle tank American locomotive.

In the general layout of the plant, attention has been given to sewers, water and power conditions. A 36-in. reinforced concrete sewer, into which empty two 24-in. sewers from the open-hearth building and mills, and running west from the creek across the north end of the future extension of the open-hearth building, will care for all waste water. A concrete dam with two 4-ft. flood gates has been placed in the creek near the Baltimore & Ohio tracks, and the creek widened above the dam to accommodate a water storage of 6,500,000 gal. In the pump house adjoining the dam are two 10-in. 2000-gal. per min. Manister centrifugal pumps, which pump the water through a 12-in. line to

a 300,000-gal. standpipe, located at the south end of the bar mill building. All water will be measured through a Venturi tube, giving an accurate estimate of the total water consumption.

In the designing of the plant, special attention was given to the elimination of hand labor by the substitution of machinery and labor saving devices. The location of the plant, too, is particularly well chosen, as it has railroad connections with three trunk line roads, the Pennsylvania, the Baltimore & Ohio and the Erie; and, as it is the only steel making unit in the district lying north of Columbus, and between Cleveland-Canton on the east, and Gary on the west, it has a marked advantage in freight rates on the steel scrap produced in this district. It is also close to its supply of pig iron, limestone and coal.

Practical Aspects of Electric Gray Iron

Advantages Over the Cupola—Actual Results from Heats Made Recently—Effect of Nickel and Chromium—Comparative Costs

BY C. H. VOM BAUR*

WHEN it is considered that it takes but very little oxygen in iron to make it weak or blowy and that this oxidation can be overcome by combining it with some of the carbon of the bath at a high temperature, we get a mental picture of what the electric furnace does to insure good iron regularly. As an indication of this phenomenon, iron of practically the same chemical composition, after being superheated in the electric and consequently deoxidized, often for only half an hour or less, shows increased transverse strength of from 2800 to 4800 lb. per sq. in.

More than 10 years ago Schoenawa mentioned briefly some of the possibilities of the electric furnace for gray iron. Some work was done in the next five years, notably at a small foundry in California where coke and pig iron are expensive and scrap and electricity are cheap. However, it was not until 1917, when a basic electric furnace was installed in a Cincinnati plant as described by Elliot two years later, that real interest was aroused among a few to install electric melting and refining furnaces with cupolas as preheating furnaces for the charge, or to install them alone where the electricity is cheap enough. Since then Dr. Moldenke's paper on electric gray iron has appeared, further discussion and tests have been made, as well as new installations. With each new installation the higher quality of the electric gray iron is being recognized. The lesser cost of this superior iron is one cause of the newer installations, irrespective perhaps of the higher quality.

Use of Borings and Turnings

In considering the lower cost of the electric gray iron, as mentioned later on, compared to cupola iron one feature stands out pre-eminently. This feature is also a determining factor of the lower cost of the electric iron. It is the fact that cast iron borings and steel turnings are used for the major part of the charge and no pig iron. Sometimes some cast scrap is used in the mixture of borings and turnings. It is the difference in the cost of the raw materials between the cupola alone and the electric furnace charge, that makes the first main difference in the final saving. Borings have so far really never been used to advantage in the cupola.

When these boring mixtures, with or without turnings and cast scrap, are preheated in a coal or coke fired furnace and then charged hot into the electric, the saving in favor of the electric is even greater. Electricity has to be very cheap indeed, in order to beat out this preheating, yet the preheating always has the advantage of producing a greater output and a greater tonnage for the capital invested. When the cupola duplexes with the electric, the older type can use the cheapest mixtures of all cast scrap, irrespective of the silicon, sulphur, manganese or carbon content. Phosphorus can be entirely absent, as it is not needed, the electric heat producing abundant fluidity. The other four elements can be altered to suit, the test samples taken during the progress of the heat showing what is necessary.

Advantage of Superheating

Further advantages making for the importance of this subject are that as electric iron can be superheated, no cold iron need be poured into pigs for there will not be any; consequently there will be a greater amount of castings shipped compared to the iron poured. Second, there is the deoxidation mentioned in the opening paragraph. Third, with the basic bottom, sulphur is reduced to 0.02 per cent with ease and to traces if desired. The interference of sulphur with the silicon action therefore has no more terrors for the foundrymen. Lastly any adjustments in the chemical composition can be made with ease before pouring.

Some Heats That Have Been Made

Numerous heats have been made recently of which very accurate results were kept. Some of the mixtures have been all No. 2 cast scrap; some 50 per cent cast, 25 per cent borings and 25 per cent turnings. When steel scrap is added, depending on the specifications to be met, different adjustments must be made, and the ease with which these are accomplished is one of the delights of the process. The carbon to be added, when in the form of coke is about three times the theoretical when charged with cold or preheated scrap in the beginning, where steel is part of the charge. It is better to have too much recarburizer than not enough, as it is more difficult to recarburize later on, (unless pig iron is added, which is not economical) than to lower the carbon which is often done by adding steel scrap. This also lowers the silicon somewhat and dis-

*Consulting, electrical engineer, 25 Church Street, New York.

turbs the graphitic carbon ratio, yet the desulphurization at the end of the heat will rectify this to a certain extent, the lower sulphur allowing a lower silicon to do its work in making a gray iron.

Any steel scrap addition also lowers the phosphorus and it can be increased by adding stove plate. As the basic bottom is preferable, in all campaigns made with it the sulphur is lowered with the heavy basic lime slag, fluor spar and coke breeze, all added toward the end of the heat when the superheating takes place. If the carbon is too low, this can be raised by adding coke mixed with enough borings in the form of a brick to make it sink in the molten bath. Manganese usually is not too high but too low. After the bath is only partially melted test samples can be taken, poured into vertical flat bars, chilled on one side, the depth thereof showing the relation of the division of the carbon; after that, adjustments are made as desired.

Thus any chemical and physical changes can be made while the electric is in operation, and these corrections consummated with a degree of finality which is impossible in the cupola, and made at a trifling cost. Thus poor cupola metal can be superheated and refined in half an hour in the electric.

Effects of Nickel or Chromium

The effect of small amounts of nickel and chromium is interesting. The silicon will not do its work of throwing out the carbon, even when the silicon is nearly 2 per cent, with these two elements present in small amounts yet iron with as low a silicon as 1.30 per cent will more than do this when there is no nickel and chromium present. The resulting combined carbon may be as high as 1.25 per cent with the nickel and chromium present and the iron, though hard and extraordinarily strong, can yet be machined.

Scope and Future of Electric Gray Iron

The economical limitations of the electric melting and refining furnace in the iron foundry to-day are defined by the size of the output, not too small and not too large—the price of electricity, available scrap and some form of suitable recarburizer.

The output should not be smaller than 3 to 4 tons a day of 9 to 12 hr. The higher production is perhaps only limited by the size of the electric furnace. A company having a very large foundry, as in the case of some of the large automobile manufacturers, might possess a blast furnace having an output the same as the foundry, a mixer between the two, and the electric might be of 40 or even of 60 tons per heat. At present a 12-ton electric will give 100 tons in 24 hr., when melting cold cast scrap, and 50 per cent more when preheating the scrap. Electric power should not cost over 1.75c. per kw.-hr. Near some of the water power stations it can still be purchased for less than ½c. per kw.-hr. For raw material, the cheaper the borings, turnings and other cheap scrap compared to pig iron prices, the cheaper the process. Recarburizer costs from \$4 to \$12 per ton, depending on the material and the location.

Concretely, then, what does the process offer? Taking specific cases where electricity is 1.50c. per kw.-hr., turnings and borings \$5 per ton; cast scrap \$11; pig iron, \$24; coke, \$10, and an output of 20 tons of electric gray iron in 10 hr., the saving over the cupola, when melting cold scrap in the electric consisting of 75 per cent borings and the balance turnings, is \$10 per ton. When this same material is preheated, the saving is \$18 per ton. When melting a mixture of all cast scrap in the cupola and refining in the electric, the apparent saving when in the ladle may be only a dollar or two. However, the real saving with any of the foregoing electric processes is in having a greater percentage of merchantable gray iron castings go out of the shipping

room for the money expended, compared to any straight cupola castings. This greater ratio of good castings accomplishes another saving, as large as the direct saving mentioned. The so-called semi-steel can also be made in any of these electric processes.

More water powers are now being rapidly developed. Millions of tons of high sulphur scrap are yet to be remelted. Specifications for better and stronger gray irons are called for daily. The cupola alone cannot make the newer and higher class iron and it cannot operate cheaper than it does. Truly this is the age of the electric furnace.

Will Investigate Coal and Other Industries

WASHINGTON, Jan. 3.—As one of the results of the recommendations made by the President's Unemployment Conference, Secretary of Commerce Hoover next week will name a special staff to conduct a survey of the bituminous coal situation. It will relate specifically to intermittency of production and employment as well as to questions of reduction of operating costs and prices, and probably will take five or six months before it is completed. The work is to be financed by funds raised from coal operators, but the cost is not expected to exceed \$6,000 or \$7,000. The services of engineering societies, superintendents of mines, mine operators and employers, and others, have been volunteered, and by reason of this co-operation the cost of making the survey will be kept at a minimum, and will make it possible to expedite the work.

The study to be made with regard to the soft coal industry is one of a number of others that will be instituted with regard to intermittent and cyclical employment based on recommendations of the Unemployment Conference. Machinery already has been set up which will enable the conduct of these studies and as pointed out by Secretary Edward Eyre Hunt of the conference, in a recent postscript to the report of the conference itself, public opinion, for the first time in American history, has been focused on unemployment, and municipal committees have been organized for the first time on a nation-wide scale to relieve the situation. Other results of the conference also were stated by Mr. Hunt, such as the unprecedented sale of municipal bonds for public works, the appropriation by Congress of funds for important public works, and the introduction by Senator Kenyon of the bill for long range planning public works.

Changes Proposed in Engineering Contracts

Six changes in engineering contracts are urged by the Engineering Association of Nashville. The association has sent a copy of the proposed changes to the American Engineering Council of the Federated American Engineering Societies, of which it is a member, and to the Association of General Contractors to be considered by them in the drafting of a general uniform engineering condition to a contract. The Nashville recommendation is that the general provisions to a contract should include clauses on the following subjects:

1. A satisfactory arbitration clause should be adopted and should be legally binding on both parties.
2. A definite policy of inspection should be adopted and if two or more separate interests are concerned in payments for work, one authority shall act for all.
3. The contract should specify results, or the method to be followed, but not both.
4. The time of acceptance should be as early and period of maintenance as short as practicable.
5. The contractor should not be held responsible for contingencies beyond his control, and contingencies should be defined.
6. Reasonable limits should be placed upon the engineer's power to increase, or decrease the amount of work to be performed by the contractor.

The Connecticut Labor and Factory Inspection Department estimates the average weekly earnings of factory workers decreased 15 to 20 per cent in 1921.

Lowest Output in Relation to Capacity

(Continued from page 3)

of which 332,375 tons were shipped, as compared with 245,133 tons; and steel sheets, of which shipments were 159,069 tons, as compared with 151,513 tons in 1920.

Japan was a very heavy buyer in certain lines. This was particularly true of steel sheets, Japanese purchases of 97,710 tons representing 62 per cent of our entire sheet exports. In rails Japan took 32,589 tons, which is far more than any other country. One explanation of the great quantities of steel sheets taken by Japan is that they are used extensively for roofing, for billboards and for the making of toys and small household utensils. Considerable tonnages also are going to galvanizing plants in Japan.

The table below shows how export shipments of products which are stated in the statistics in tons compared with previous years:

Exports of Iron and Steel, Gross Tons				
	1918	1919	1920	1921
January	495,345	360,456	333,601	547,394

Wage Reductions

In striking contrast with the preceding year, 1921 was not marked by any serious labor troubles, although numerous threats were made, including that of a general railroad strike to be called on Nov. 1. There were many reductions in wages at iron and steel works. As the year came in, cuts of 20 to 25 per cent went into effect at independent steel mills. The Steel Corporation made its first wage reduction on May 16, amounting to 20 per cent. This reduced common labor from \$5.06 to \$4.05 per day. Salaries were reduced also. Up to that time the Corporation had adhered to its schedule, announced Feb. 1, 1920, which recorded the ninth advance since Jan. 1, 1916. The Steel Corporation abolished overtime on July 16 and on Aug. 29 made another reduction, bringing the wage of common labor to \$3 per day. There was serious unemployment in steel works communities throughout the year. At some Eastern Pennsylvania plants the wages of common labor went as low as \$2 per 10-hour day, or to the level of 1915. At some Central Western works the rate for common labor declined to 25 cents per hour as against 30 cents at Steel Corporation plants.

An Unemployment Conference assembled in Washington through the efforts of President Harding and Secretary Hoover adopted various measures to improve the situation and succeeded to some extent.

Federal Trade Commission Cases

The Federal Trade Commission early in May, by a vote of three to two, issued a complaint in the now famous Pittsburgh price basing case, setting forth alleged violation of the Clayton anti-trust act. The Steel Corporation filed its answer about a month later and the Government attorneys have been busy since in studying the case, but it is not known when the hearing will be or when a decision may be expected. The complaint is directed against the Steel Corporation and its subsidiaries only, despite the fact that independent steel producers participated in the hearings and the arguments of the original case in 1919 and 1920.

Another matter before the Trade Commission attracted considerable attention—the charge made on

behalf of domestic producers that British makers of ferromanganese and their American agents had been dumping that product in this market. There were protracted hearings. The final decision was that the charge of dumping had not been sustained.

The Federal Trade Commission has taken a position of antagonism to many iron and steel companies in its efforts to compel all such companies to submit to it regular detailed reports of their costs. The demands of the Trade Commission for data and for the filling out of forms entirely different from those used in company business, involving in some cases an expense of thousands of dollars a year, are being contested vigorously and the case is now before the Supreme Court of the District of Columbia.

Consolidation Tendencies

The probability that a number of independent steel companies would be consolidated has been before the trade in the past year or more. The strain all producers were under in 1921 and the prospect that a condition of unprofitable operation would continue for some time have caused leaders in the industry to think seriously of various merger projects. Saving in overhead and the benefits of mass production through concentrating operations in a given line of product at a particular plant have been among the advantages considered. Just as the consolidations of the late eighteen-nineties and the early nineteen-hundreds came after the depression that began in 1893, so the present period of distress for iron and steel works is developing a tendency to concentration.

Seven companies are involved in the most important consolidation project now being worked on: Midvale Steel & Ordnance Co., Lackawanna Steel Co., Youngstown Sheet & Tube Co., Republic Iron & Steel Co., Inland Steel Co., Steel & Tube Co. of America, and Brier Hill Steel Co. Their combined steel ingot capacity is about 20 per cent of the country's total, while that of the Steel Corporation is 45 per cent.

A separate project involving the merger of the Youngstown Sheet & Tube Co., Inland Steel Co. and Steel & Tube Co. of America had been under negotiation before the seven-company merger was seriously taken up. More recently the three-company merger has seemed to have better prospects of consummation than the other. A number of smaller mergers are also talked of, and in the last 10 days of 1921 the American Rolling Mill Co. acquired the Ashland Iron & Mining Co., Ashland, Ky., with its two blast furnaces, six open-hearth furnaces, sheet mills and coal and timber lands.

Profits Disappear

The year was disastrous for producers of iron and steel in all lines. A statement submitted at Chicago in December at the hearing on Lake Superior iron ore rates before an examiner of the Interstate Commerce Commission, made the following showing of deficits in the first three quarters of the year: Republic Iron & Steel Co., \$2,177,472; Lackawanna Steel Co., \$2,182,687; Midvale Steel & Ordnance Co., \$3,933,731. The United States Steel Corporation showed net earnings of \$32,286,722 in the first quarter, against \$42,089,019 in the first quarter of 1920; \$21,892,016 in the second quarter, against \$43,155,705 in 1920, and \$18,918,058 in the third quarter, against \$48,051,540. The corporation paid its preferred and common dividends for all three quarters. After such payments it had a balance of \$2,816,905 in the first quarter and deficits of \$4,571,668 and \$6,965,504 in the next two quarters. The more favorable showing for the Steel

Corporation than for independent companies may be explained in part in the light of the \$95,000,000 fund it set aside from surplus "to absorb any sudden and

violent diminution in inventory valuations." Charges and allowances for depreciation have been considerably less than in times of good earnings.

Poorest Iron Ore Production in Many Years

Reduced Mining Operations and Ore Shipments—Agitation Concerning Rail Rates Continues

WITH the movement of iron ore from the mines reduced in greater proportion than the consumption, 1921 was the poorest ore year in 17 years. Lake shipments were only 22,300,726 gross tons as compared with 21,226,591 tons in 1904. Compared with these figures is the record year of 1916, when the movement by water was 64,734,198 tons. The average shipments by water during the past ten years have been slightly over 50,000,000 tons.

With the reduced demand for ore, mining operations in the Lake Superior district were materially reduced early in the year and later many mines were shut down entirely. Many ore boats did not leave the docks during the season, the ore cargoes being insufficient to keep half the lake vessel capacity busy. As the iron and steel industry continued to go backward during the first half of the year, early estimates that ore shipments would reach 35,000,000 to 40,000,000 tons were scaled down.

Before the opening of the season of navigation, a number of consumers having long-time contracts advised shippers that they would be unable to take any ore during the year, for, with reduced consumption during the previous winter and early spring, they had carried over enough ore from the previous season to last them through 1921.

There were no reports of sales of Lake Superior ore in the East during the season and very little was taken by Eastern consumers on long-time contracts. Had conditions created a demand, the high freight rates would have shut out lake ore, as delivered prices on foreign ores were much lower. The shipping season got under way very late and with most shippers closed early, there being very little ore shipped after October.

Greatly Curtailed Shipments

Ore shipments were curtailed during the year to a greater extent than the reduction in consumption. As a result, the year 1922 starts with over 3,000,000 tons less ore on the lower lake docks and in furnace yards than on the same date a year ago. On Dec. 1 the amount of ore on docks and at furnace yards was 38,300,000 tons as compared with 41,500,000 tons on Dec. 1, 1920.

On May 1 last, stocks on docks and in furnace yards amounted to 31,500,000 tons, being over 10,000,000 tons greater than on the same date in any previous year. This large surplus was due to the slump in the iron and steel industry that started late in 1920. Figured on the rate of ore consumption in November, 2,188,000 tons, the balance on docks and in furnace yards on May 1 this year would be approximately 27,300,000 tons, or a reduction of over 4,000,000 tons from the amount carried over from May 1 last. However, there was an increase in the rate of consumption in December owing to the blowing in of additional furnaces. The probable balance on May 1 compares with a normal ore reserve at furnaces and at lower lake ports of 18,000,000 to 20,000,000 tons on that date.

Ore Market Lags

Owing to the condition of the iron and steel industry, no interest was taken in the ore market early in the year and ore prices were not fixed until June 16, or the latest in 30 years. The prices named represented a reduction of \$1 from the 1920 prices, but with a reduction of 30c. in the vessel rate on ore for last season, the mining companies took a net cut of only 70c. a ton. The new prices brought ore down to within 50c. a ton of the prices that prevailed in 1917, but mine oper-

ators claimed that this 50c. reduction was more than offset in advances in transportation costs and taxes over 1917. At any rate, with the light sales, few Lake Superior mines were operated at a profit during the year.

Railroad rates on iron ore was one of the most important matters to which shippers devoted their attention during the year and the only headway made in securing lower rates was a temporary reduction in the carrying charges on ore from both the lower lake ports and the seaboard, which was made by the Interstate Commerce Commission Oct. 20. This was a 28 per cent reduction and brought ore rates virtually back to where they were before the 40 per cent general freight advance Aug. 26, 1920. This reduction was ordered to remain in effect until Jan. 1. In December, the railroads agreed to extend the reduced rates to March 31, but the Interstate Commerce Commission refused to allow this extension of time. This was a victory for lake front furnace and steel interests, some of which had asked that the ore rates be restored Jan. 1, claiming that a reduction in ore rates, without a cut in rates on coal and coke, was a discrimination against them. No further change in rail rates on ore from lower lake ports is expected until the Interstate Commerce Commission makes a general rate reduction.

In connection with the demand for lower rail rates on ore, an application from consuming interests is pending for a reduction in dock handling charges. These charges were advanced 40 per cent shortly after the advance in rail rates, but with the temporary reduction in rail rates, a corresponding reduction in the dock charges was not made.

Lower Rail Rates Asked

While interior furnaces were striving for lower rail rates on ore from Lake Erie docks, the interest of the iron ore mining companies on rate matters was centered largely during the year in efforts to secure lower rail rates from the mines of the Lake Superior district to upper lake ports. In December, 1920, the mining companies belonging to the Lake Superior Iron Ore Association filed a complaint with the Interstate Commerce Commission against the rail rates on ore from the mines to the upper lake ports, charging that the successive rate advances made during the war had brought rates up to a point where they were unjust and unreasonable. With this action pending, the four Michigan and Wisconsin railroads, Feb. 25, 1921, made another advance in rail rates on ore from the old ranges, this advance being 15c. a ton on shipments to Ashland and Escanaba, and 10c. a ton on the rate to Marquette. Mining companies in the two States protested against these advances because the increased rates virtually wiped out the freight differentials that old range mines had previously enjoyed. An appeal was made to the Interstate Commerce Commission to suspend these new rates, but this being refused, the higher rates remained in effect during the shipping season. Later the mining companies consolidated their complaint against the Michigan and Wisconsin rate advances with their bill of complaint asking for a reduction of rail rates on ore from all the Lake Superior districts.

The action to bring down ore rates from the mines to upper lake ports dragged along during the year with the shippers anxious for an early hearing and the railroads apparently playing for a delay. After a postponement made at the request of the railroads, the first hearing finally took place in Chicago in July before an examiner of the Interstate Commerce Commission. The hearing was resumed in Chicago Dec. 7,

when leading representatives of the steel and iron ore interests appeared as witnesses and presented strong testimony in behalf of lower rates. If this case takes its regular course, a decision by the Interstate Commerce Commission cannot be expected until near the end of this year.

Miners' Wages Reduced

As in other branches of the iron and steel industry, miners' wages were reduced during the year. Successive advances had brought these wages to 171 per cent above the pre-war scale. Several leading independent

producers made a 15 per cent wage cut Feb. 1, following cuts by individual companies. The Oliver Iron Mining Co., operating the mines of the Steel Corporation, made a wage cut of 20 per cent May 16, and another cut of 10 per cent Aug. 1. Other wage reductions were made by independent mining companies during the year, and outside of the Steel Corporation mines uniform wage scales to a large extent disappeared. Near the end of the year, some mines resumed operations at further wage reductions, not that they needed to get out the ore, but solely to furnish work for their men who would otherwise have been idle.

Steel Companies Dominate Pig Iron Market

Surplus Bar Important Influence—Downward Tendency Almost Continues Throughout the Year

PIG iron production in the United States in 1921 showed a marked contrast with that of 1920. In 1920 blast furnaces were crowded at maximum capacity to meet the large demands, with a total output of 36,925,987 tons, a figure not far below the best results ever achieved in the greatest production years, whereas in 1921 demand for iron fell off so sharply that the year's total production only slightly exceeded 16,000,000 tons—the lowest mark since the depression of 1908.

Though the operation of steel company furnaces was in larger ratio to capacity than that of merchant furnaces, the decline in output among both classes of producers was a striking reflection of the drastic contraction in consumption of iron and steel in all divisions of the metal-working industry.

Steel company furnaces dominated the pig iron markets throughout the year. Many owners of merchant furnaces kept their stacks in idleness rather than engage in selling iron at prices which in the latter part of the year represented actual losses of several dollars per ton. Those merchant furnaces which remained in blast were constantly in competition with the steel companies on both steel-making and foundry grades. Forced liquidation of iron ore stocks by the steel companies placed iron on the market at constantly declining prices, which were only slightly checked beginning in September, weakness again developing late in the year with some further declines.

On basic iron the net loss during the twelve months is indicated by the January average of \$30, Valley furnace, as compared with the December average of \$18.62. Foundry iron in the Pittsburgh and other producing districts declined correspondingly.

High Freight Rates

Throughout 1921 the high freight rates greatly reduced the degree of competition between districts. As usual, Buffalo and eastern Pennsylvania furnaces competed actively in New England and other intermediate Eastern territory where freight rates to consuming points were about equal, but in most districts iron business was definitely localized. This, of course, particularly affected the Alabama and Virginia furnaces, which had always been obliged to seek a considerable part of their orders out of their own districts. Very little Alabama iron came north. The Virginia furnaces, with high producing costs and high freight rates, were so completely shut off that in the latter part of the year that iron producing district was entirely idle, not a single furnace remaining in blast.

Features of the Pittsburgh Market

The Pittsburgh pig iron market was headed downward almost constantly from the beginning to the end of 1921. An attempt was made about the middle of August to advance prices, and for about six or seven weeks there was sufficient demand to sustain a rally

from \$18 to \$19, and later to \$19.25 for basic and of about \$2 in foundry grades, which moved up from \$19, Valley furnace, for No. 2 (1.75 to 2.25 silicon) to \$21. Before Nov. 1 the market began to give way and December found prices only slightly above the low point of the year reached early in August, when basic touched \$18 and No. 2 foundry \$19 at Valley furnace. It was one of the worst years the pig iron makers in that district ever experienced as far as business was concerned, and while coke prices were fairly reasonable and even low compared with those of 1920, neither that nor the reduction of \$1 per ton in ore, a dip in limestone prices, nor the cut of 30c. per ton in the lake freight on ore, enabled producers to get costs down to a point where profit remained at the prices obtainable. High freight rates kept up costs for all makers, the common claim being that the assembling costs on the materials required for a ton of iron were from \$9.60 at Youngstown to about \$10.50 at points just outside Pittsburgh, though within the Pittsburgh district. The reduction in ore of \$1 per ton did not help much because most makers had a good deal of ore brought down in 1920, which had not been used up and as bearing on costs the ore had previously been written down about \$1 per ton. Moreover, purchases of ore were small because the need of supplies did not exist.

The cut in rail rates on ore came practically at the end of the lake shipping season and too much was down at furnaces to help iron makers.

The lot of the merchant producers was a hard one. They had to carry a lot of high priced iron made up against old orders, on which shipping instructions could not be obtained because the buyers were able to do better at other than their regular supply sources, while on the steel making grades and occasionally on foundry iron they were constantly in competition with the steel companies. A Youngstown steel maker made up at least one lot of 10,000 tons of foundry iron and the supposition is that this was not the only instance or that others did not do likewise to some extent. The steel companies made the iron market during much of the year. They were slower to curtail production than were the merchant producers, some being obliged to keep on furnaces to use up coke from by-product plants, which once started cannot be entirely stopped without serious impairment and consequential loss. Little merchant, as distinct from steel company, basic iron, figured in transactions during the year, the bulk of the iron coming from steel works' stacks.

In July the Carnegie Steel Co. went as low as 13 furnaces active out of 59, the lowest point ever touched by the company. Only one merchant furnace in the Pittsburgh district was in blast throughout the year, this being a stack of the American Manganese Mfg. Co., Dunbar, Pa., which was on foundry grade most of the time.

Steel Companies Also Dominated East

During most of 1921, the eastern Pennsylvania pig iron market was dominated by three steel companies, which, however, are regular producers of merchant iron.

The exclusively merchant operators kept their stacks idle during a considerable part of the year, but there was resumption at three or four merchant furnaces late in the year. The price tendency of steel-making and foundry iron was downward, beginning with the first week of January. Re-sale iron was freely offered during the first few months and to a certain extent dominated the market.

Steadily declining prices met with resistance on the part of producers on two or three occasions, even slight advances being put into effect, but these were short-lived. Whenever a fairly good tonnage was inquired for, the competition of producers for the business resulted in further concessions. The price decline halted in August, when \$18.50, furnace, was reached on No. 2 plain iron, this comparing with prices of \$30 to \$32 early in the year on the same grade. Buying became more active when the low price had been reached, the principal large consumers being the cast iron pipe companies, but later in the year the furnace and stove companies were fairly active buyers. The improvement in buying set in in August and was followed by a very good September. In the latter month, the active furnaces succeeded in selling enough iron to fill their order books for the remainder of the year. After the fourth quarter buying had subsided, the market lapsed into quiet again and this continued until inquiries for first quarter of 1921 made their appearance early in December. First quarter buying was in fairly good proportions, but the competition for business resulted in lower prices in late December, despite the expectation of some sellers that first quarter prices would be slightly higher than for the last quarter of 1921. One sale to a New England melter was made at \$19.30, eastern Pennsylvania furnace, for No. 2 plain, and though this was a special transaction that was not duplicated, the market settled to \$19.50 for No. 2 plain and 50c. or \$1 higher for No. 2X at the close of the year. One sale of No. 2 plain was made as low as \$18, furnace. Basic iron sold in December at \$19, furnace, a net decline in quoted prices of about \$14 within the year. Low phosphorus, malleable and gray forge grades were in small demand and prices remained nominal much of the time.

Pig Iron Demand in New England

During the summer months the consumption of pig iron by the New England foundries dropped to within striking distance of the vanishing point, but before the end of the third quarter improved business conditions set in. It is doubtful whether the average melt of the jobbing foundries since improvement in business started has exceeded 30 per cent, at best, of the 1920 average. The showing of New England as a whole probably would run near that figure because of the activities in the textile machinery, heating and stove industries. Makers of such equipment have consumed large pig iron tonnages. The year closed with textile machinery makers less active, the stove makers only fairly so, and the heater interests operating at capacity, while the jobbing foundries were operating indifferently.

Competition for business in New England among furnaces in these two districts has been unusually keen. On the almost steady decline in prices throughout 1921, eastern Pennsylvania furnaces at first were leaders in price cutting. Possibly this was largely due to the activity of the Eastern steel mills for pig iron business. The advent of a Buffalo steel company in the market brought a change in price cutting leadership. Even with a freight differential against them, the Buffalo furnaces by the end of November practically forced the eastern Pennsylvania furnaces to give up the fight for business in New England. The Buffalo furnaces accomplished this by disregarding silicon differentials. Central Pennsylvania furnace interests, entering the market late in the year, were obliged to meet Buffalo prices.

Cincinnati Market Extremely Quiet

The Cincinnati iron market, in common with that of other districts, was a quiet one during the whole of the year 1921. True, there were some spurts, but nothing that could be termed activity developed. Practically

all of the jobbing foundries, which cater principally to the machine-tool manufacturers, were closed for several months early in the year on account of a strike of molders, and when this was settled business had fallen away to such an extent that only about one heat a week, on an average, was being secured.

Prices of pig iron steadily declined throughout the year, Southern foundry having been quoted at an average of \$36.50, delivered, in January, and at \$22, delivered, in the last week of December. The same condition was true of Northern iron, the average quotation for January being \$33.77, while that for December was \$22.27. Silvery irons showed an even greater decline, the quotation for 8 per cent on Jan. 1 being \$52.52, delivered, while on Dec. 29 the quotation was \$30.02, delivered.

The output in the Ironton-Ashland district during the year was the smallest for many years. Practically all the furnaces in that district were down for the greater part of the year, and early in February there was only one furnace operating. For the first time in many years, during the month of March, pig iron production in that district ceased entirely, though one silvery furnace in the Jackson County district was in operation during the whole of the year. At the close of the year two furnaces were operating, one at Ironton making foundry iron, and one at Ashland on basic. The prospects for the year 1922 were brighter, as the Portsmouth stack was about ready to go in, and one of the Bessemer furnaces at Ironton was expected to blow.

Cleveland Iron Buying Small

With Ohio foundries operating at around 25 per cent of capacity or less, the demand on lake furnaces for pig iron was light throughout the year. Only two important industries appeared to keep up to near the normal consumption of pig iron, the radiator manufacturers and the makers of enameled iron sanitary ware. These bought iron in liberal quantities. There was virtually no demand from the large stove foundries in this territory. The demand from foundries engaged in automobile work was very light, as large quantities of motor castings were carried over from the year before. Pig iron buying during the year was almost wholly in small lots for early shipment.

At the start of the year there was a large amount of foundry iron carried over on old high priced 1920 contracts. Furnaces have worked this iron off slowly. Different plans have been followed in cleaning up these old contracts, but the more general plan has been for a furnace to ship a consumer one ton of iron at the current market price and another ton on his old contract carrying the high price. There is still a large tonnage of this high-priced iron on the furnace books. A disturbing feature of the market was the offering of considerable resale iron by foundries, either directly or through brokers, during the early part of the year at from \$1 to \$2 a ton below regular prices.

Prices steadily declined during the first seven months of the year. At the beginning of the year No. 2 foundry iron was quoted at \$34 lake furnace. By April it had got down, to \$25 and late in July to \$20. In August the market stiffened up 50c. to \$1 a ton, but it gradually slipped back to \$20 in October. In December the market was rather weak and some sales were made at \$19.50.

Chicago Pig Iron Market

The dullness of the Chicago pig iron market during 1921 was accentuated by the fact that the agricultural implement industry, ordinarily a large consumer in that territory, was practically idle the entire year. The railroads bought practically nothing until June. At that time, the St. Paul entered the market for iron for its Milwaukee foundry and continued to buy from month to month through the remainder of the year. Railroad equipment manufacturers like Griffin Wheel Co., American Steel Foundries, and others also became more active in the latter half of the year. Buying by

Iron and Steel Prices for Twenty-One Years

Monthly Averages Computed from the Weekly Market
Quotations of THE IRON AGE in the
Period of 1901-1921

IN this issue of THE IRON AGE are our two annual charts, in which lines are plotted to indicate the course of prices for pig iron, billets and leading forms of finished iron and steel and non-ferrous metals in the 21 years ended with 1921.

The diagrams are based on monthly averages of prices quoted week by week in our market reports from the leading selling centers. In the tables following are the monthly average prices on which the charts are based.

Monthly Averages of Ferromanganese Quotations

KEY TO CHART ON FERROMANGANESE PRICES

- I. August 6, 1914, the first week of the World War, saw German shipments cut off and British deliveries uncertain; ferromanganese sold as high as \$150 per ton spot. The average shown is for three weeks.
- II. During February, 1915, "married contracts" were made by consumers of British ferromanganese holding contracts at \$38 per ton, which were averaged with the new \$68 quotations. Spot sales were made as high as \$90 per ton.
- III. Hereafter quotations are based on spot domestic prices.

- British shipments were uncertain and prices were based on \$63 per ton or on "married contracts."
- IV. In April, 1918, the standard of ferromanganese was reduced from 80 to 70 per cent with adjustment of \$4 per unit from the \$250 per ton quotation. We quote 80 per cent.
- V. From May 22, 1919, until November 13, 1919, we quote British ferromanganese, which dominated the market at from \$5 to \$10 below domestic prices.
- VI. These quotations are all on a delivered basis.

(Continued from page 56)

car builders did not become a factor until relatively late in the year, when heavy railroad car orders were placed. The automobile industry was a small buyer this year, although it did account for the movement of some iron during two relatively short periods. During April and May, some of the foundries serving the automobile industry became more active, but this activity consisted principally of the shipment of finished castings on which they had not yet received releases from the car manufacturers. In the latter part of July, August and September, there was a fair amount of buying of iron by foundries of this class. The most prominent purchasers of the year were manufacturers of sanitary ware, plumbing goods, heating apparatus and other household appurtenances. The American Radiator Co., the Standard Sanitary Mfg. Co., United States Radiator Co. and Kohler and Rundle in Wisconsin were among the companies of this class which bought frequently throughout the year. This activity was accounted for by dwelling house construction, which was stimulated by high rents.

From the first of the year until Aug. 1 there was a steady reduction in pig iron production in the Chicago district and out. It did not again start to increase until early in October.

Resale iron was a factor in this market in January and February, but by the end of the first quarter had largely been absorbed. While the decline in prices was uninterrupted until early in August, there was a moderate revival in business in March, April and May. The leading merchants, Pickands, Brown & Co., reported that their shipments in March were 30 per cent larger than in February, that April shipments were 30 per cent greater than those of March and that May shipments were 40 per cent larger than April. June and July, however, were exceedingly dull months. When the last Pickands, Brown furnace went out, the Inland Steel Co., which had been selling merchant iron throughout the year, advanced its prices and considerable business was closed at the old quotations on the eve of the advance. At the end of August, Inland again advanced its prices to \$21, forcing in considerable business at the old quotation of \$20. Early in September, it made a third advance to \$22, but this was not effective. The first break in the market resulted from the unloading of speculative tonnage bought by a broker at the old price of \$21. By Nov. 15

the price had dropped still lower to \$20 base and in December there was a further recession to \$19.

Buffalo Iron Down to \$19.50

In the twelve months just closed Buffalo prices sagged from \$32.50 base—the ruling quotation Jan. 1, 1921—to \$19.50, the present market. Furnace operation picked up materially in the closing weeks of the year. The minimum operation was touched in July, when only three stacks were in blast out of a complement of 22. Nine stacks are now going. The lowest price the Buffalo market reached was \$18.50, but this concession was only in special instances when radiator interests came into the market for unusually large tonnages.

Coke Reverses Preceding Year's Record

Light Demand, Low Prices and Small Production Natural Results of Reduced Operation of Blast Furnaces

THE coke market in 1921 reversed its 1920 course. Instead of a demand well in excess of supply, which carried prices to the highest levels attained since coke production began on a commercial scale, there was always a sufficient supply and prices descended to the most reasonable bases in several years. The coke business usually is either a feast or a famine with the Connellsville producers. They enjoyed a "feast" in 1920, but in 1921 they had to put up with very lean times. Not a factor which contributed to the 1920 conditions remained in 1921. Steel companies operating their own by-product coke plants were not forced in 1921, as they were in the previous year, to depend on the beehive ovens, for a goodly part of their coke requirements, due to Fuel Commission regulations, which made it difficult to secure coal for their by-products plants; nor in the year just ended did the steel companies have transportation difficulties to defeat their coke producing efforts, and export demands were lacking as an excuse for pushing up the price of coal.

As a matter of fact, the coke requirements of the steel companies were moderate in the extreme last year, because of the subnormal demand for steel and

some of them having by-product plants actually became commercial producers of coke, not having a sufficient number of blast furnaces in operation to absorb the production. Merchant producers of pig iron were not pressed for tonnages and the number of such furnaces in blast rarely in recent years has averaged as low as in the past year. Only one merchant furnace in the Pittsburgh and nearby districts was in blast throughout the entire year, and this stack, one of the two operated by the American Manganese Co., Dunbar, Pa., oddly enough, runs on by-product coke, that company operating a Semet-Solvay installation. In late June, not a merchant blast furnace in the Mahoning and Shenango valleys was in blast and at the end of the year only three of the 14 merchant furnaces in that district were making iron. Operations of furnaces in other districts usually served from Connellsville ovens, also were low last year.

Greatly Reduced Production

The records, as compiled by *The Connellsville Courier*, indicated a production for 1921 of less than 3,400,000 net tons, or less than one-third of the output of the previous year and the ton value of last year's

production was less than one-third of that of the previous year, calculating on the average price for the whole year. The average price of spot or prompt Connellsville furnace coke for 1921, based on the weekly prices of THE IRON AGE, was \$8.32 per net ton at ovens. The highest price of the year, which was made early in January, was \$5.50. The 1920 average price of this grade was \$11.32, while the peak price was \$19. The descent in foundry coke prices in 1921 was in like ratio, although the demand for this grade relatively was better than that for furnace fuel, because the foundries averaged a slightly better relative operation than did the blast furnaces. The average price for spot or prompt Connellsville foundry coke for 1921, was \$4.63 per net ton at ovens, which compared with \$13.10, the 1920 average, while the top price in 1921 was \$7, as compared with \$20 in 1920.

Wage Reductions

There were several wage reductions during the year which materially reduced the costs of the Connellsville mine and oven operators, but they did not avail much in producing profits because never during the year was there very full mine or coke oven operations. The wage scale now in effect is that posted by the H. C. Frick Coke Co., effective Aug. 1, last. This schedule is the same as that of Nov. 10, 1917, of the same company. Independent operators for a time were paying a lower scale, but the threat of a strike and possible unionization of the district resulted in their adoption of the Frick scale, which, as compared with those unionized coal mining districts, gives the Connellsville operators a decided advantage as to costs. It is because of this advantage that the results for 1921 were not worse than they were, since it permitted the naming of prices on coal with which operators of union mines could not compete, and Connellsville coal moved to a number of markets not usually reached.

Not a Prosperous Year

Last year was not a prosperous one either for the by-product coke oven operators. Most of the steel companies having such plants operated at as low a rate as possible, without injury to the ovens, for they did not need much coke with many blast furnaces idle.

Commercial by-product plants had to keep going to meet gas requirements and the coke had to be sold cheaply, if at all. In the East, Connellsville coke was available usually at a delivered price well below that quoted by the by-product coke plants, which were at a decided disadvantage by reason of the high freight rates on coal.

There was a little change during the year in the relative standing of the by-product and beehive oven capacity. Few beehive ovens have been abandoned, while costs did not decline sufficiently to encourage additions to the number of modern coking plants. There are built and building in this country, 11,628 by-product coke ovens capable of producing annually 44,000,000 net tons of coke. Such a tonnage would have exceeded the total 1921 requirements and it also is patent what a large percentage of the country's needs now can be supplied from by-products plants when it is recalled that the maximum production in one year of both by-product and beehive oven coke was 56,000,000 net tons. This considerably exceeds the country's normal annual requirements, which, if it became necessary, probably could be accommodated by the by-product plants alone.

Improving demand for pig iron during the past few weeks gives rise to hopes of the early blowing-in of a number of blast furnaces, but there were no indications of such developments in the coke market in the closing weeks of 1921. Only a few contracts, for furnace coke, were under negotiation and these were for the first quarter requirements of furnaces now in blast. The gain in active blast furnaces since the low point of last July assures production to meet such increase in demand as has lately developed.

Safe Prices for Semi-Finished Steel

Lack of Activity in Bars Affects Adversely Consumption of Billets-- Large Spread Between Billets and Rods

SHEET bars stood out last year as the most active form of semi-finished steel in a market which, generally, was decidedly subnormal in respect to demand, in keeping with the market for finished products. Not a few users of bars have the facilities for rolling them from billets and in ordinary times find it cheaper to buy the billets than the bars. Similarly, not a few makers of tubular goods, lacking the facilities for making steel, are equipped to convert slabs into skelp, and as a rule buy the slabs. Over much of the past year bars and skelp have been available at rather less money than they could have been made for at the prices which ruled for billets and slabs. A slow and uninteresting market in these forms of steel, therefore, has been an altogether natural condition. Since most commercial producers of semi-finished steel also have finishing capacity, it is also natural that they should have tried to secure as much business in finished products as possible, not only to secure the finishing profit, but to avoid the condition of being obliged to sell the semi-finished material so cheaply as to have this recoil against them in the shape of competition on the finished products. The situation with regard to sheet bars differs from that in billets and slabs in that the makers of sheets and tin plate, lacking steel making capacity, have no intermediate product to draw on as bolt and spike manufacturers or the makers of tubular goods.

That sheet bars should have shown the lead in activity, therefore, is not surprising.

Little Buying of Bars

The lack of real activity in merchant mill products such as hot-rolled flats—hoops, bands, cotton ties and strips—affected adversely the consumption of billets, but the heaviest loss in billet tonnage is directly chargeable to the very low ebb to which the buying of merchant steel bars fell in the past year. There was only limited buying by the agricultural implement manufacturers who felt heavily the contraction in buying by the farmers, who in 1921 were not better off financially than they were the year before. Railroad buying of bars amounted to little and the automobile industry was less a factor than before in several years. The automobile makers carried over rather heavy tonnages from 1920 into 1921 and even when these stocks were used up, they were careful to gage purchases by requirements. Demands upon the makers of cold-finished steel bars and shafting were light throughout the year and this affected the consumption of hot-rolled bars and, in turn, billets. Inactivity in slabs reflected the relatively light demand, taking the year as a whole, in pipe and plates. If it were not for a brisk rally in the fall in the price of crude oil, consumption of slabs would necessarily have been smaller than it was, for

the appreciation in oil prices brought out late in the year some rather good orders for line pipe and for oil storage tanks. Trading in forging steel was limited and sporadic. The automobile industry was a sparing buyer of forgings; there was little business from the implement manufacturers or the railroads and the low rate of shipyard activities also told heavily on the demand.

Demand for Wire Rods Curtailed

Every use to which wire rods are put was restricted in 1921. Wire products suffered by reason of the light demand from the agricultural regions, which usually take 50 per cent or more of the total output of the mills. Chain makers were not crowded with business, nor were the makers of screw stock or rivets.

Prices of semi-finished steel were soft throughout the year and attempts to either stem the downward movement or to establish an advance proved even more futile than did those in finished materials. This was because producers did not always have orders sufficient to absorb production and the non-integrated manufacturers exerted a good deal of pressure on prices to get the unfinished steel cheaply enough to be able to compete in the market in finished products. Sheet bars declined from \$47 in January to \$29 in September and the latter price was not exceeded on much tonnage during the remainder of the year. In the September effort at price stabilization, when sheet prices were advanced \$5 a ton, the quotation on sheet bars was put up to \$32, but just as the consumers of sheets were allowed to enter orders at the old prices, sheet makers who buy their bars were given a chance to cover their requirements at the old basis. Another advance in sheets was attempted in early October and at the same time an effort made to put sheet bars to \$34, but the

effort was a dismal failure and since it was followed by a decline in sheets to even below the early September bases, the price ideas of buyers of sheet bars declined accordingly.

The market at the end of the year was \$29 to \$30, Pittsburgh or Youngstown, this price showing a decline for the year of \$17 to \$18 per ton or about 38 per cent. Soft billets dropped from \$43.50 in January to \$29, and the latter was the basis of such business as was done in the closing weeks of the year. This was a decline of about 35 per cent for the year. Forging billets fell from \$48.50 to \$32 or about 34 per cent and wire rods from \$57 for the base size to \$38, a decline of \$19 a ton, or one-third of their January, 1921, value. As compared with 1913, the last normal year prior to the war, soft billets now show an advance of only \$3.21 per ton on the average price of that year, while rods at \$38 are \$9.60 per ton above the 1913 average. The spread between billets, and rods in the 1913 average was \$2.61 per ton; to-day it is \$9 and this presents a condition that sooner or later must find correction.

Average Monthly Prices on Semi-finished Steel, 1921
Pittsburgh

	Billets		Sheet Bars		Wire Rods
	Bessemer	Open-Hearth	Bessemer	Open-Hearth	
January	\$43.50	\$43.50	\$47.00	\$47.00	\$57.00

Plates, Shapes and Bars Dull

General Disposition to Abandon Pittsburgh Basing Point—Reduced Operations of Many Consumers

THE steel industry last year had its first taste of the effects of the war time expansion in capacity for rolling the heavy tonnage products, and is hoping fervently that 1922 is not going to repeat the dose. With capacity for caring for very much greater tonnages of plates, shapes and bars than were wanted, it is merely stating the obvious, in observing that competition for business constantly waxed keener, not only between mills in the several producing centers, but actually between the centers themselves. In the latter part of the year, there was an open abandonment of the Pittsburgh base in the quotations of mills, both East and West, and indeed, on the part of at least one Pittsburgh company, which undertook the delivery of steel products by the inland waterways and took orders on a delivered instead of an f.o.b. Pittsburgh base, with an idea of offsetting the freight rate advantages enjoyed by Western mills on Western and Southwestern business, when the latter began billing f.o.b. mill or f.o.b. Chicago. Buffalo mills, while the New York State barge canal was open to navigation, largely controlled the Eastern market by quoting delivered prices, New York, which, because of the low canal freight rate, were well below those named by mills, either in Pittsburgh or observing the Pittsburgh base. In passing, attention should be drawn to the fact that manufacturers using the inland waterways for shipments wisely quoted a delivered price instead of a mill base, and adding the water freight rate. To have adopted the latter plan instantly would have focussed the attention of the railroads on the question and possibly might have resulted in an upward revision of the water rates. The competitive conditions of the year, of which the use of the waterways was one result, accomplished what Western consumers of steel for several years have been agitating, the abolition by law of Pittsburgh as a sole basing point of steel prices. As a matter of fact, there is never, except when it will best serve their purposes, very rigid

observance by the manufacturers outside of Pittsburgh of the Pittsburgh base, but non-adherence is not usually as open as it was during the latter part of 1921. While the tendency to quote an f.o.b. mill or a delivered price embraced almost all steel products, it was more pronounced in plates, shapes and bars than in the other lines.

Previous Period of Stagnation

With regard to the demand for these major steel products, it is necessary to go back to that period of stagnation which ruled just before and after the beginning of the world war, as the last previous time when manufacturers experienced such lean times as they did last year. The early part of 1919, following the signing of the armistice, was dull, but there was a recovery which was broad and rapid in that year, while in 1921 business was good only for a period of about eight or ten weeks, roughly, from about the first of September until the middle of November. During the first eight months of the year, consumers were chiefly concerned in reducing the large stocks carried over from 1920, and since this process was slow and laborious, new buying was both sporadic and small. There was very little industrial construction, because expansion in this direction during the war was so great that the country's requirements for the next few years at least, had been anticipated. The obstinate position of the building trades in refusing to go along with the economic and industrial readjustment, while it did not entirely stop new office and other structural work, undoubtedly prevented the placing of much more work of this sort than actually was placed. It was not the cost of the steel, its fabrication or erection, that prevented the placing of structural work, for steel prices declined 40 per cent during the year and even more as compared with the 1919 peak prices, while there were projects in several parts of the country against which the fabricating shops contracted to furnish, fabricate and erect the steel

at prices around \$60 per ton, which was approximately the price for work of a like character before the war.

Work of Fabricators

According to the compilations of the Bridge Builders and Structural Society, all of the fabricating shops of the country for the 11 months ended Nov. 30, had taken orders aggregating 686,800 tons. With the country's fabricating capacity over 180,000 tons a month, the business for the 11 months would have been sufficient to keep the shops running full for less than four months. These facts bracketed with the large stocks carried over from 1920, picture graphically the causes for the lowest operation structural mills have had in a number of years. Structural beams started the year at 2.45c., Pittsburgh, and ended at 1.50c., and this price not infrequently at mill instead of Pittsburgh. While attractive tonnages usually were stipulated, it became the practice of mills toward the end of the year to regard orders for 400 or 500 tons as "attractive."

Railroads Repair Rather Than Build

The railroads were not important factors in the demand for structural material. They repaired rather than built new bridges. They were not directly, or indirectly, heavy buyers of plates and bars at any time during the year, although they did create some business for the plate mills in the repairs to equipment they started after the July 1 wage cut became effective, and later provided a fair amount of plate business by ordering some new cars, the details of which are given elsewhere in this issue. It was the oil industry, through its pretty constant orders for storage tanks, which provided the best outlet of plates during the year. Incidentally, the fabricating in transit privilege was freely exercised in connection with tank orders and this resulted in an abnormal placing of the plate orders. Mills located much further away from the fabricating plant frequently were able to underquote nearby mills by reason of having a lower through rate to ultimate destination. Demand of the shipbuilding industry for plates were small to the point of being trifling. There was no Government building of merchant steamships during the year and little private construction on either the coast or the lakes. The largest order that came out in Cleveland was 3200 tons and this was for repair work. Warship building brought no new business and much tonnage ordered now may be cancelled in the event the

naval construction holiday is approved by the various nations represented at the disarmament conference in Washington. Plate mill capacity expanded more than any other class of mills during the war and this contributed in no small measure to the weakness of prices during the year. Plates were quoted at the beginning of 1921 at 2.65c. Pittsburgh. At the close of the year they could be bought at 1.50c. f.o.b. Pittsburgh, f.o.b. Chicago or f.o.b. mills. Plate mill operations in all parts of the country were low during most of the year but because of the increase in number it is possible the output may show well by comparison with pre-war records on a fewer number of units.

Limited Buying of Bars

Steel bars suffered in demand because of the sub-normal requirements of the agricultural implement makers, the railroads and the automotive industry, which ordinarily account for the great bulk of consumption. The automobile makers carried over large stocks and though they enjoyed a couple of spurts of good business, they got along without finding it necessary to make big purchases. Railroads waited until labor became more reasonable before doing any buying and then they bought sparingly. The implement makers again were confronted with the problem of trying to find business among buyers without money. Two successive years of low prices for farm products made the financial position of the farmers so bad they simply had to make their old tools do. A Chicago hard steel bar plant, dependent almost entirely upon the implement industry, was shut down in December, 1920, and since has not turned a wheel. Bar mill activities like those in plates and shapes, rarely were good during the year, and the competition for business was so keen that, like plates and shapes, bar prices drifted away from a Pittsburgh base. The common price in Pittsburgh, Chicago, Cleveland, Buffalo and other points of production at the end of the year, was 1.50c. At that price f.o.b. Pittsburgh, bars were below the 1913 average and if prices in other markets are reduced to the Pittsburgh equivalent, there is a price as low as 1.12c., deducting the freight of 38c. per 100-lb. from Pittsburgh to Chicago. That is very close to the extreme low point of pre-war times. If pre-war prices are the ultimate goal of buyers, bars have not far to go and as bearing on the future course of the market it must be noted that bars are more fully deflated than probably any other steel product.

Lean Year for Wire Products

Low Prices of Farm Products Have Marked Effect—Efforts to Stimulate Business

HISTORY was made last year in wire products. For the first time on record, an attempt to advance prices by means of the usually successful formula of first intimating an early advance and then allowing buyers to cover for 60 or 90 days at the prevailing prices, was a dismal failure. This happened early in November, when the American Steel & Wire Co. and some of the independents notified their customers of an impending advance, but expressed a willingness to take contracts for two or three months at the "regular" quotations of \$2.90 base per keg, Pittsburgh, for nails and \$2.60 base per 100-lb., Pittsburgh, for plain wire. In September such an effort had been fairly, but not wholly, successful. In August, business, which previously, since the beginning of the year, had grown progressively worse, began to increase and with orders, notably from jobbers, coming in fairly freely, the time was considered ripe to attempt a price stabilizing effort. Accordingly most of the manufacturers advised the trade that as of Sept. 12, there would be an advance from \$2.75 per keg for nails to \$2.90 and in plain wire from \$2.50 to \$2.60; in cement coated nails from \$2.35 per count keg to \$2.45 and in galvanized wire from \$2.95 to \$3.10, and galvanized barbed wire from \$3.40 to \$3.55. The American Steel & Wire Co., which

initiated the movement, secured more than 300,000 tons of business as a result of the lifting of quotations and a number of the independents also secured substantial contracts covering the ensuing 60 and 90 days. All makers of wire products did not follow the advance, the Youngstown Sheet & Tube Co. being one of them, and some of those who made the advance failed to get many contracts.

Inasmuch as the business secured on the drive was at the old and lower levels, and that some companies never departed from these prices, the new quotations were the basis of little or no business. This is easily understood when it is repeated that all companies did not share alike in the business which came out in September and the customers of those that had the lightest bookings would be put at a disadvantage with those of the more successful manufacturers if obliged to pay the new prices. Moreover, there still remained the companies which did not make the advance. All that resulted from the advance was that distributors were able to get a larger profit, since they, of course, based resale prices on the new mill bases, although covered on supplies at the old prices.

It was to give basis to the quotations \$2.90 for nails and \$2.60 for wire that the November drive for orders

was started. With steel prices generally showing a downward slant at that time, jobbers and consumers could not see the justification in an advance in wire products and accordingly failed to respond. Some contracts were made at \$2.90 for nails and \$2.60 for wire, but being on the basis of an advance which was to follow, they became only "scraps of paper" when the advance did not take place. If there were any shipments against these contracts, they did not carry higher prices than \$2.75 for nails or \$2.50 for wire and in a broad way those were the maximum prices obtained during the last half of the year. The market grew weak in December, when wire dropped to \$2.25 base per 100-lb. and there was considerable shading of \$2.75 for nails, forced by the action of some of the smaller makers in quoting on a mill instead of a Pittsburgh base, and thus giving buyers the advantage of savings in freight. On Dec. 15, prices were dropped \$5, making wire nails \$2.50 and plain wire \$2.25.

As was true of almost all steel products, there were several attempts during the first half of 1921 to stabilize prices of wire and wire products, but it invariably happened that no sooner were prices set up as "regular" than that they were toppled over by some makers who needed orders. In the April stabilization movement when the Steel Corporation lowered its prices and independent prices were advanced, nails were put at \$3.25 base per keg, Pittsburgh, and wire at \$3 base per 100-lb., Pittsburgh, but these prices were not long

maintained and a drop of \$5 per ton, which came a few weeks later, was followed by another of the same amount, before business began to pick up in August.

It was a lean year both in business and profits. Prices over most of the year were soft and this fact, as usual, made for cautious buying, while financial distress in the agricultural regions largely cut off the most important outlet for wire products. The farmers did not have the money to buy fence or wire because there was no money in their crops in 1921 and following the disastrous results of 1920, their credit with the banks was impaired. The makers of fence did everything possible to stimulate business. As early as July they were giving November datings on orders and later they gave guarantees against a decline in prices, running up to the spring of 1922. But neither effort helped much. Nails were the most active wire product, and they, as far as profits go, are to manufacturers as sugar is to the corner grocer. There are hopes that 1922 is going to be much better than 1921, but few expect better business until the second quarter, because the farming population hardly will be buyers before then, while nails, being essentially a building necessity, can not well move freely until the weather is open enough to permit such work. As compared with other steel products, excepting only sheets, wire products at current prices have made relatively less progress back to normal pre-war prices and this may have some bearing on the 1922 demands.

Decreased Demand for Sheets and Tin Plate

Automobile Industry Not as Important a Factor as in 1920—Many Tin Plate Mills Idle

THE story of the sheet market in 1921 does not vary much from that in other steel products. Independent manufacturers, who in 1920 enjoyed highly prosperous times, with a large production sold at high prices, in 1921 experienced neither a large business nor profits. Indeed, if the estimates of producing costs have either value or basis, the prices which prevailed during most of the year must have forced incursions into the surplus accounts built up in 1920. A number of mills, notably those of the American Sheet & Tin Plate Co., were kept fairly busy by a pretty constant demand for light gage black sheets from Japan and some demand for this kind of stock also came from European countries. It was not particularly satisfactory business, since it was of the tin mill gages and dimensions and it was so costly to produce that several makers who shared in the business later regretted that they had. However, the business was something of a backlog and helped to keep some capacity going when domestic business was light and hard to get.

Domestic business was considerably below normal, taking the year as a whole, and it was really small by comparison with that of 1920. There was a good demand for sheets used for building purposes and those engaged in the building of railroad cars were relatively good buyers of corrugated galvanized sheets for car roofs and ends. The latter demand, however, was less in connection with new cars than in the repairs to old ones. The automobile industry was not nearly the factor in the market in 1921 it was in the year before, but the tonnage that industry purchased in 1920, as has been pointed out frequently before, was greatly magnified by the fact that there are so few manufacturers who can make sheets of the kind used in automobile bodies, fenders, cowls, hoods, etc., and also because the desire for rush shipments created a stir far greater than warranted by the actual business placed. It was an even lighter year for the makers of such sheets than it was in the automotive industry itself, for the reason that the automobile makers almost without exception, carried over pretty big supplies and in those periods when business was good they did not have to make many or large new purchases. Electrical sheets were dull throughout the year, not only because the slump in the demands upon makers of automobile starting and lighting systems but because it was a dull year

for the makers of motors generally. Jobbers evidently carried over pretty large stocks from 1920, because they evinced little interest in the market until late in the year.

Declining Price Tendency

The tendency of prices throughout the greater part of the year was down and until the last month or so efforts to check the decline or to stabilize prices met with little success. The beginning of the year found all makers quoting a uniform basis of 4.35c. for black, 5.70c. for galvanized and 3.55c. for blue annealed sheets. These were the prices which the Steel Corporation subsidiary had observed throughout 1920, and indeed from March 21, 1919. The independents found it impossible late in 1920 to do business at above these bases and they found out early in 1921 that they could not get business at those prices. The Steel Corporation enjoyed a business in January that permitted it to keep 90 per cent of its mills running. With independents averaging less than a third of the rate, it was only natural that such an uneven division of the business should have aroused them to action. And it did. Early February saw price cutting by the independents to secure orders and thereafter until September prices were weak under open market competition. Even in September, when prices were advanced \$5 a ton or from 2.75c. to 3c. for black, 3.75c. to 4c. for galvanized, the gain to the mills was in orders rather than in money returns, for preceding the advance buyers were given ample time to cover at the old prices. When another advance of \$5 per ton was attempted in early October, it not only failed but was followed by a fresh decline, carrying prices even lower than they had been prior to the September advance. The October attempt at putting up prices failed because so many requirements were filled on the September drive and also because it came before the September advance was established.

From Nov. 25, when the American Sheet & Tin Plate Co. opened its books for first quarter and first half of 1922 business, and named 3c. base for black, 4c. base for galvanized and 2.25c. base for blue annealed, on first quarter business, the market showed marked firmness on those bases. Business was slow but all makers seemed tired of taking business at a loss and these prices were well observed. The American

Sheet & Tin Plate Co., which profited none by the high prices of 1920, had to go along with the decline in 1921 to hold its trade, but it did have the satisfaction of having a relatively better average operation of its mills than the independents, and also of turning out a higher proportion of its potential capacity than the outside companies.

There were only trifling additions to sheet mill capacity during the year, and these were entirely by the independents, who made a net gain of about 20 mills, counting 8 new mills of the Republic Iron & Steel Co., at Niles, Ohio, and 10 new mills at the new plant of Follansbee Bros. Co., at Toronto, Ohio. The Apollo Steel Co., Apollo, Pa., added to its capacity, but there was some dismantling of units by others.

Tin Plate Market Was Disappointing

The tin plate market for 1921 was a disappointment, as following two light years, last year was expected to be good. If production was as much as 50 per cent of normal capacity, it will be a big surprise. There was not the demand in the first place and secondly, labor troubles kept a number of plants idle for several months, and in one instance for the entire year. These troubles affected mills which previously had been operated under an agreement with the Amalgamated Association of Iron, Steel and Tin Workers, and came

as a result of an effort to establish "open shop" working conditions. Three of the five companies finally signed up with the association and got going in the fall after being down since June 1, while the other elected to fight out the issue.

The demand for tin plate for perishable food was good in connection with the pack of peas and for condensed milk, which got fairly well back from the distressful conditions of 1920, where the over-production of the war time period was bearing down heavily on the industry. The pack of tomatoes and other vegetables was low and there was almost no pack of salmon, although 1921 was a year of a good run of these fish. Oil can and general line requirements were good but could have been better. Packers generally underestimated their requirements and there were a good many hurry-up orders after the vegetable packing season had started. The mills, lacking production orders, made up a good deal of tin plate and this put the market on more of a spot than a contract basis over a good deal of the year.

Prices began the year at \$7 per base box, dropped to \$6.25 in April, to \$5.75 in July and to \$5.25 in August, to \$5 in October and finally to \$4.75 in November, this latter price being the official quotation of the American Sheet & Tin Plate Co., effective Nov. 3, and applying to all shipments after that date.

Oil Well Demand for Pipe

New Field in Texas is Developed—Year Begins and Ends With Cuts in Steel

THE year began, and it might almost be said, ended with a price reduction in steel pipe, for on Dec. 15, the National Tube Co. issued new cards which lowered the price of standard or merchant pipe \$5 per ton, oil country tubular goods by a like amount and line pipe \$6 per ton. The first day of the year 1921 saw the issuance by several independent makers of steel pipe, of new cards, which reduced their prices to the levels which the leading interest steadily had observed from March 21, 1919. Throughout 1920, the independent cards had shown advances of \$7 to \$10 per ton over the National Tube Co. quotations, but the actual sales prices during most of that year had only remote relation to the card quotations. High prices in 1920 were largely, if not wholly, due to the demands of the oil industry. The collapse of the oil market late in that year cut sharply into the demands upon all makers, but hit the independents hardest since the bulk of their bookings was at prices well above those of the National Tube Co. Shrinkage of independent order books forced the revision in independent prices back to the level of the leading producer and this change came on or about Jan. 1, 1921. Four other changes, all reductions, came during the year, with the National Tube Co. usually taking the lead in putting out new cards, but only because its cards, though always adopted by the independents, soon after issue became obsolete, as selling bases, owing to the competition for business.

First Change in April

The first change in steel pipe discount cards came April 8, when the Mark Mfg. Co. issued a card increasing the discount 5 points, thus cutting the price \$10 per ton, putting the base size of black butt weld pipe at 62½ per cent off list. This reduction was not met by other independents or the National Tube Co. and the card was withdrawn, when as of April 13, the latter issued its first new card since March 21, 1919. This card made reductions of from \$4 to \$10 a ton in black butt weld standard pipe, and \$4 to \$12 a ton in galvanized butt weld in the sizes ¼-in. and larger and of \$8 to \$10 per ton in lap weld standard pipe. Corresponding reductions were made in oil country and line pipe. This card also made some changes in size groupings, ½ in. being set up as a separate size; formerly it had been bracketed at the same discount as ¼-in. pipe, and the base sizes of butt weld pipe, previously, from ¼-in. to 3-in. were changed to 1-in. to 3-in. This

new card was part of an effort at steel price stabilization, which crystallized in uniform quotations by both the independents and the Steel Corporation on all steel products, this move bearing a date of April 12.

Cards Disregarded

Observance of the April 13 steel pipe card soon grew lax, and on July 7 it was supplanted by a new one, which lowered standard pipe \$2 to \$4 per ton on the butt weld sizes and \$4 to \$6 a ton on lap weld sizes, while oil country pipe was lowered \$4 to \$7 a ton. This change merely affirmed publicly prices which previously had been made quietly. The July 7 cards remained effective for an even shorter period than the preceding one, for on Sept. 16 new schedules appeared, which made a cut almost as deep as that of April 13. The Sept. 16 cards reduced butt weld sizes of standard and line pipe \$8 a ton and lap weld sizes \$8 to \$10, with oil country goods declining to about the same extent. This card also changed the size brackets on large diameter lap weld pipe; previously 7-in. to 12-in. pipe took the same discount, while in the Sept. 16 card 7-in. to 8-in. pipe and 9-in. to 12-in. pipe were set up at separate discounts. Business in steel pipe, which had steadily declined during the first seven months of the year, improved in August along with other steel products, but not nearly to the extent of providing all manufacturers with more than part capacity operations. The upward slant of demand continued during the remainder of the year, with real activity appearing in line pipe, due to a rally in the price of oil and the opening up of the new Mexia field about 75 miles southwest of Dallas, Tex. Despite the improvement in business, however, there still was not enough to go around and there continued to be application of the stimulant of concessions from the established or regular prices. Price cuts in line pipe were particularly severe, sales of 4-in. pipe being made in November as low as \$44 per net ton, Pittsburgh, at a time when merchant pipe of the same size was quoted at around \$70 per net ton.

Disparity in Prices

On the ground of producing costs there is little excuse for such a disparity. The actual cost difference size to size, between merchant and line pipe, largely is in the fact that the coupling for line pipe must be heavier and stronger than the merchant pipe coupling.

and consequently more costly. But there is usually more tonnage per order of line pipe than in merchant pipe and the former being more desirable from the manufacturers' standpoint, there naturally is keener competition for business. The cutting of regular prices was not confined to line pipe, however, there being instances where the supplementary discounts, on merchant pipe, to large jobbers instead of the regular one point and 5 and 2½ per cent off, went as high as two full points, or 70½ per cent off list for the base sizes. This condition forced the new card, dated Dec. 15, previously referred to.

The end of the year found the card discount on the base sizes of merchant steel pipe at 71 per cent off list, as against 57½ per cent as of Jan. 1, a rise in the discount of 13½ points, the equivalent of a reduction of \$27 per ton. The year, as a whole, was an unsatisfactory one, especially when contrasted with 1920, when the market purely was a sellers' affair, while last year the advantage was with the buyer. Caution was the keynote with buyers throughout 1921, but this augurs well for 1922, since it means relatively light stocks in jobbers' and consumers' hands. This year gives promise of considerable oil well development, since oil prices are back upon a profitable basis and it also promises well for merchant pipe because there remains a shortage of housing to be partly made good in the next twelve months.

Welded Iron Pipe

The story about wrought iron pipe with respect to business is similar to that of steel pipe. There was the same transition from stout to lean order books in

the early part of the year and a gradual gain in the last four or five months. Price revisions in wrought iron pipe have been as frequent as in steel pipe, there being one March 1, another April 13, another July 7, and the last one Sept. 1. The first change was a cut by the Reading Iron Co., which canceled about one-half of the advance made by that company in December, 1920. This change put the principal makers of iron pipe on the same basis of prices. The April 13 reduction was \$6 to \$12 a ton on standard black pipe, and \$6 to \$14 a ton on galvanized. In July iron pipe prices were cut \$8 to \$12 per ton, or just double the reduction made at that time in steel pipe. On Sept. 1 came another cut, this time of \$10. The base discount on black wrought iron pipe stood at 25½ per cent off list Jan. 1; on Dec. 31 it was 44½ per cent, this being equivalent to a drop of \$36 a ton for the year.

Spread Between Iron and Steel

There has been very little narrowing of the spread between steel and wrought iron pipe during the year. It was a matter of \$64 a ton in favor of steel at the beginning of the year, and at the end of the year amounted to \$63 a ton, these figures being calculated on the base sizes of black butt weld pipe. This price advantage for steel pipe is a real hardship for makers of wrought iron pipe, in competition with steel pipe, and apparently there is little likelihood of a change in the price relation of the two kinds, because the manufacture of iron pipe involves much hand labor which does not gain in efficiency or cheapness, as do the mechanical means employed to an ever-increasing extent in the manufacture of steel pipe.

Uneventful Year in Old Material

Low Rate of Operations at Metal Working Plants Reflected in Dull Market for Scrap

IN a year in which iron and steel production was at the lowest point in many years, the demand for scrap was also at a minimum. The year was uneventful in every respect. Price tendencies were downward, with the exception of brief periods in May and again in the early fall when a slight gain in operations among steel plants, foundries, iron rolling mills, etc., created a better demand and an upward movement in prices.

While the net decline in the price of heavy melting steel, delivered in the Pittsburgh district, was only a little over \$1 a ton during the year, other grades declined much more. For example, No. 1 cast at Pittsburgh dropped from \$25 to \$16. In other districts, there were similar declines. Heavy melting steel for delivery at eastern Pennsylvania steel plants was quoted at \$14.50 early in January and at \$11.50 in late December.

During the year, production of scrap naturally fell off because of the low rate of operations at most metal-working plants and much of the scrap offered for sale came from the railroads. In the monthly sales of railroad scrap, the bids put in by consumers were frequently higher than those quoted by dealers and brokers, hence a good deal of the railroad material passed directly into the hands of its users.

The low prices reached in mid-year attracted the speculative interest of both dealers and consumers and considerable scrap was accumulated. Some steel plants have sufficient stocks in storage to last for two or three months, at least, even though a better rate of operations is reached in the first quarter of the year than has been possible during 1921. Scrap dealers have accumulated old material at varying prices, some having started to buy speculatively before the bottom of prices had been reached. The effect of this will be to withhold these accumulations from sale until prices have reached a point where a good profit can be had. Some dealers have heavy melting steel in their yards which has cost them about \$15 or more a ton and obviously will not dispose of it until prices have reached what to them is a profitable basis.

The Pittsburgh scrap market showed its greatest

weakness in April, June and July. In April, dealers seemed to tire of guessing where the bottom was and, having tied up a good deal of money in yard stocks, withdrew from the market. Steel orders, accumulated on the price stabilization effort of April 12, caused some improvement in scrap demand in May, but it was short-lived and the market turned weak in June and July. Improvement in the steel business and in steel works' activities after the middle of July filtered through to the scrap market in August, and thereafter until about the middle of November there was fairly well-sustained buying of the steel works grades. The steel mills of the Pittsburgh district had a fairly good run of business between Sept. 1 and Nov. 15, but as it was low-priced, effort was put forth to keep down costs of production, and this was largely achieved by increasing the melt of scrap. The highest prices paid for steel scrap came early in the year. Steel companies figured more heavily in the tonnages bought than foundries, few of which, with the exception of those making castings for sanitary ware, were at all well engaged. The end of the year found many yard dealers carrying large stocks, bought at prices which would net a loss if sold below \$17. While railroad lists were fairly heavy each month, offerings of industrial scrap were light. The automotive industry was a relatively small producer of scrap in 1921.

Eastern Pennsylvania Market Inactive

During a greater part of the year the demand for scrap from eastern Pennsylvania steel plants, and likewise from other metalworking industries which melt scrap, was very small. Many consumers took advantage of the situation to pick up their requirements from offers which in the terms of the trade are classed as "forced sales," and one steel company, though not operating its plate mills for a considerable part of the year, accumulated a large store of steel in small lots and this scrap it still has in readiness for the time when an increased steel production requires its use. Two or three plants which run entirely or very largely on a scrap mixture were fairly consistent buyers

throughout the year, but the grades they use are chiefly stove plate, railroad grate bars, borings and turnings. Only during a short time in the fall was there a fairly active scrap market in the Philadelphia district, and after that show of strength the market lapsed into weakness which continued up to the end of the year. If any point is worthy of special emphasis regarding the 1921 scrap market, it is that production of scrap as well as consumption fell far below normal. Scrap dealers regard the available supply as inadequate for any quick revival in steel production. Since the low prices were reached six months or so ago, dealers have been bullishly inclined and strongly of the opinion that prices will advance with some rapidity on the first dependable showing of improved business conditions in the iron and steel industry.

Much of the supply of borings and turnings naturally flows from New England to the Pittsburgh and eastern Pennsylvania steel-making districts, but during 1921, production in metalworking plants was so low that the supply of borings and turnings was exceedingly limited, this causing spurts of strength in these grades at various times during the year.

Cleveland Scrap Market

The Cleveland scrap market probably suffered more from the depression during 1921 than any other consuming center in the country, owing to the very limited operation of Cleveland mills. From being an important consuming center of scrap from outside producing points, Cleveland had to find an outside market for much of its scrap, a large share of which went to Valley mills, Canton, Weirton, and the Pittsburgh district. Previously, Cleveland mills had consumed much of the scrap produced at the Detroit automobile plants, but other outlets had to be found for the Detroit scrap, much of it going to Valley mills. The absence of a local demand resulted in unusually low scrap prices in Cleveland, as scrap sold for outside shipment had to carry a freight rate, and the lowest freight rate to an outside consuming point was \$2.10. The activity during the year was confined largely to heavy melting steel and blast furnace borings and turnings. Cleveland iron rolling mills bought no scrap during the year and sales of cast scrap were very light.

One Cleveland mill purchased considerable heavy

melting steel to lay down in its yard and little of this has, as yet, been consumed. Some of this was bought at \$10, delivered, and the highest price paid was \$13. Prices on heavy melting steel ranged from \$14 to \$14.75 at the opening of the year, but settled down to about \$10.50 to \$11 in June, and in December had worked up to \$11.50 to \$12.

Chicago Scrap Market in 1921

During 1921 there were four speculative advances by Chicago scrap dealers, only one of which, however, was of long duration. Toward the end of January dealers bought railroad material freely and advanced their prices, but this boom quickly burst early in February, following which there was a continued drop in prices until the end of April, when dealers again commenced to bid against each other for railroad material and laid in stocks in their yards in anticipation of subsequent buying by consumers. This advance continued until the end of May, when the market broke again. Declines proceeded throughout June and July, prices reaching the low point of the year in July. In the last week of July the dealers again took heart as a result of two good-sized steel purchases by mills. All through August, September and October the dealers continued to lay in stocks at advancing prices and sold some material to consumers at the rising quotation. Toward the end of October, however, the prospect of a railroad strike tended to weaken the market and distress tonnage was sold at reduced prices. During the middle of November the market advanced again, but soon broke, and at the end of 1921 prices were again declining.

Average Monthly Prices for Leading Grades of Scrap,
Per Gross Ton, Delivered, Pittsburgh

1921	Heavy Melting Steel	No. 1 Cast Cupola	Bundled Sheets	Machine Shop Turnings	Cast Iron Borings
January	\$15.50	\$25.00	\$11.00	\$10.00	\$13.00
February	16.00	22.75	11.00	10.00	12.00
March	14.00	21.20	10.30	9.40	11.45
April	12.625	18.00	9.00	8.125	9.375
May	13.30	18.00	9.00	8.70	9.70
June	12.6875	16.625	8.25	7.5625	8.375
July	12.00	16.00	8.00	7.00	7.625
August	12.70	16.20	8.60	7.85	8.30
September	13.625	16.875	9.375	9.0625	9.00
October	14.125	17.50	10.375	9.5625	10.125
November	14.30	17.10	10.80	9.85	10.40
December	14.25	16.13	10.50	8.88	9.25

Postponed Buying of Cast-Iron Pipe in 1921

Municipalities Frequently Re-advertised Because of Declining Market
—More Sales Than in 1920

THE rapid liquidation of cast-iron pipe prices during 1921 caused a year of unusual uncertainty for both producers and buyers. Municipalities continually advertised for bids, only to reject them and re-advertise later, when the chances were they would receive lower offers. Prices declined approximately 33 1/3 per cent during the year—more specifically, 25 per cent in the East; 33 per cent in the Chicago district; and 38 per cent in the Birmingham district. Gray forge pig iron fell about 31 per cent in the same period.

The first of the year saw general reductions in pipe foundry labor, averaging 20 per cent; pig iron began a gradual descent; however, pipe prices did not respond to the lower making costs until the middle of the year when the drop came suddenly. From the middle of May until the last of August, prices in New York fell from \$63.30 to \$42.30 for the 6-in. size. Two weeks later, they were raised about \$5 a ton and continued at that level the remainder of the year.

Compared with other iron and steel industries, the year for the pipe makers was excellent. Only one line of iron and steel manufacture rivaled it—those engaged in the manufacture of heating equipment, such as radiators, stoves and boilers. It was reported from Chicago at the middle of November that the "tonnage booked to date this year compares favorably with that taken during the entire previous year." Figures from two thirds of the plants of the United States show total bookings up to Dec. 1, 1921, of close to

280,000 tons as compared with 285,000 tons for the entire year of 1920.

Such a heavy demand was natural. During the war the price of pipe had been so high and labor so scarce that municipalities and private companies had postponed, where possible, the making of pipe line extensions. The past year witnessed not only greatly reduced prices, but a super-abundance of labor. Much of the pipe bought in 1921 was largely to give work to the unemployed in the various communities. Hindrances to sales were the high freight rates, the difficulties of some municipalities to float bonds and the receding prices which caused a postponement. One city in the Central South signed a contract for the purchase of 6000 tons of pipe. When it realized the freight was \$30 per ton, it canceled the order. Heavy tonnages were shipped by boat to the Pacific Coast by Southern makers out of Mobile, the freight rate being \$14.13, as compared with an all-rail rate of \$31.70. A delivery was made from a New Jersey shop to Texas by water more cheaply than it could have been made by rail from a Birmingham district shop.

There were practically no irregularities in the operation of the railroads, such as the embargoes of the year before. The only approach to transportation trouble was the threatened railroad strike in November which caused a deluge of rush shipment orders on the part of purchasers, as well as the bringing in of a few fresh orders in anticipation of a railroad tie-up.

The high freight rates encouraged the use of wooden or steel pipe, which came into competition more keenly than usual. For instance, a Missouri city purchased wood pipe; a city in Michigan asked for 5000 tons of pipe, inviting bids on wood and steel, and eventually buying 1000 tons of steel and the remainder, cast-iron; in December an up-New York State city considered seriously the purchase of 6000 tons of steel pipe, which was lower-priced, but decided on cast-iron. Cast-iron pipe, as compared to wood, is an exceedingly heavy commodity per foot, as is observed when the freight is paid.

At the first of the year we reported that: "Business has fallen very flat. Plants with old orders are running at perhaps 25 per cent capacity; other plants are shut down completely. Buyers of pipe are waiting for pig iron market to become stabilized." About the first of

February many of the shut-down plants had re-opened. Operations continued in increasing volume and at the middle of April we reported that "Pipe is the one commodity in the iron and steel industry for which there is a full-fledged demand." In December the demand was still considerable, being greater than normal for that season of the year.

Present momentum will carry the buying movement well into 1922. Many pipe laying jobs are being planned for the spring. At the close of the year, the oil companies, liberal purchasers but for some time dormant, came into the market again for flanged pipe and will continue in 1922. To keep pace with the building movement water systems will be extended; smaller pipe will have to be replaced with larger sizes; municipalities that postponed purchases will finally close. The year ahead appears promising.

Non-Ferrous Group Marking Time Most of the Year

Copper Strong at the Close—Sharp Liquidation in Tin—Steady Demand for Lead—Zinc at Pre-War Levels

AFTER a year of readjustment, lagging demand and curtailment in output—a year generally acknowledged as one of the worst on record—the major non-ferrous markets enter the new year strong in sentiment and firm in prices. The last two months of 1921 were the bright spots in a very drab year, for in those months buying was the largest of the year and the price tendency decidedly higher.

Eventful Year in Copper

The year just closed has been one of the most eventful in copper annals. Aside from the depression, which has been one of the most pronounced on record, there were three developments of marked importance: Closing down of the mines, financing of stocks of refined copper for export and foreign demand, particularly from Germany.

Late in March came the decision of the porphyry mining companies and the Anaconda Copper Mining Co., as well as others, to curtail operations completely or to the vanishing point. It was recognized that costs of operation were suicidal and that nothing else was left to be done. This resulted in a reduction of mining to about 40,000,000 lb. per month. By December active preparations had been made to resume mining on a much larger scale.

About the middle of February there was announced the successful financing of large stocks of copper, involving the sale of debentures up to \$40,000,000 against 400,000,000 lb. of copper, all to be held for export and not sold at less than 12.50c. per lb. The market price of electrolytic copper at that time was 13.25c. delivered.

In foreign demand the year was phenomenal, with Germany the leading purchaser, followed by France, Great Britain and Japan in the order named. To Nov. 1 Germany had bought more copper than the other three countries combined and had taken over 40 per cent of the total exports.

The year's price trend was not erratic. Opening at 12.75c., New York or refinery, electrolytic copper fell to 11.37½c., refinery, on Aug. 26, rising intermittently after that to 13.62½c., refinery, at the close of the year, or the year's highest, with prospects of a continued advance. Buying, as well as inquiry, for the metal from domestic sources was active in the later weeks and the year closed with the market firm and statistically and technically strong.

Severe Drop in Straits Tin

Straits tin sank to the lowest levels in many years when it was quoted at 25.50c., spot delivery, New York, on Aug. 25. The high for the year was 38.75c. in January. From the low point there was a gradual advance to the end of the year, when the market closed strong and moderately active around 33c.

The principal feature of the year was the complete liquidation that took place, probably the most severe of

any of these markets. A comparison with other years will demonstrate this. The average price of spot Straits tin, New York, in 1913 and 1914 was 44.33c. and 35.80c. respectively, and in 1920 it was 50.23c. The low point for 1921 was therefore down to half of the 1920 average, with the year's closing price of about 33c. under the 1914 average. To find a lower average it is necessary to go back to 1909, when it was 29.68c.

The year as a whole was a quiet one, with sales the lowest in many years. Not until late in the year was there any active interest from consumers. In November there were periods of old-time active buying, caused largely by the increased operations in the tin plate industry, due to an unusual demand for tin plate and depleted stocks of the metal in consumers' hands. Imports of tin were the lowest in many years.

Lead a Steady Market at Pre-War Levels

The lead market has been the most consistently strong and steady of any of the markets. There have been no features of any description. The prominent fact has been that demand has been moderate but fully equal to production and that they have about balanced each other throughout the year.

In prices the metal has ranged practically between 4c. and 5c., New York, or virtually at pre-war levels. The year's high was 5.12½c., New York, in January, and the low at 4c. in March. The 1920 average price was 8.07c., while that of 1913 was 4.40c. At the end of 1921 the price was 4.70c., New York, where it had remained since late in September. Price liquidation in 1921 was complete and the market placed on a substantial, normal basis. There were prospects of a scarcity of lead in England, with exports from this country a probability in 1922.

A Very Lean Year for Zinc

Two features characterized the zinc market in 1921. One was the import of foreign zinc in the early part of the year and the other the drastic decline in foreign demand as contrasted with war and previous years.

Early in the year 10,000 tons of German zinc was purchased for consumption in this country and there were also re-shipments to this country from England of American zinc sold to British consumers. These imports were a factor only in the early months of the year.

In exports the year 1921 was a sharp contrast to previous ones. To Nov. 1, the latest available data, only 3,733,959 lb. had been exported as against 204,178,991 lb. to Nov. 1, 1920, and 211,518,470 lb. to Nov. 1, 1919. The feature of the 1921 exports was the sales to Japan. Of the total to Nov. 1 Japan bought 2,533,310 lb., or 68 per cent. France and England, the heavy buyers in 1919 and 1920, had bought none up to that time.

Price liquidation was completed in 1921; it had not been finished in 1920. The high for the year for prime Western zinc was 6.10c., New York, in January, with

the low at 4.62½c., New York, at the end of August. At the close of the year the price was 5.15c. to 5.20c., New York. That liquidation has been thorough the citation of previous prices shows convincingly. In 1920 the average New York price was 8.08c. and in 1913 and 1914 it was 5.76c. and 5.27c. respectively. The closing

price of 1921 is therefore almost a parity with that of 1914.

Buying of zinc throughout the year was largely of the hand-to-mouth order, excepting a few cases, and the year closed with demand light but with prospects for better business in 1922.

No Serious Labor Troubles

Many Threats But Few Strikes, Except in Building Trades—Cause of Collapse of Railroad Tie-up

TRANSPORTATION and labor troubles as they affected the iron and steel industry in 1920, were largely of the barking-dog variety; they threatened, but usually failed to occur. There was a threat of trouble in the forming by the American Federation of Labor of a new committee for organizing the iron and steel industry, but it proved to be nothing more than a threat. Having learned by the experiences of the disastrous strike of the fall of 1919 that unionization of the plants was possible only by first conquering the Steel Corporation, the plans of the new committee called for a concerted and exclusive drive on the plants of that interest. The Steel Corporation, it was figured, would be the first to cut wages as it had been first to advance them, and the union leaders contemplated using the wage reductions as an argument why the men should organize. The Corporation, however, was the last to cut wages and the union hopes thereby were blasted. There was a country-wide disturbance among the building trades following attempts to revise downward the wage scales of those crafts, and these troubles exerted considerable influence upon the iron and steel industry in that the resumption of building operations following such disputes left wages of this class of labor largely unliquidated and this phase stopped a good deal of construction which might have gone forward if wages had gone down in keeping with the costs of materials.

Old Transportation Troubles

Transportation troubles entirely were absent last year, in sharp contrast with 1920, when they were a pretty constant source of annoyance, and more so to the iron and steel industry than any other, since fuel and grain took preference over iron and steel in the allocation of freight cars. It was November before the iron and steel makers finally were freed from the exacting and oppressive restrictions as to the use of cars in 1920. This condition grew out of the coal miners' strike late in 1919, the walkout of the railroad yardmen in the spring of 1920, the impairment of the efficiency of railroad employees, brought about by the fact that under such an impersonal "boss" as Uncle Sam there could not be the discipline to be looked for under a Willard, a Hill, a Rea or a Cassatt. On top of these conditions was the post-war business boom of 1920 with its huge demands upon the transportation facilities.

Changed Conditions in 1921

The picture for 1921 is quite a different one. The reaction in business from the feverish activity of 1920 was even more pronounced and rapid than the recovery from the stagnant period in early 1919, following the signing of the armistice, and demands upon the railroads, notably from the iron and steel industry and the coal and ore industries, which provide so much of the bulk freight, declined in keeping with business. There was not a time during the entire 12 months that the railroads could not handle every pound of freight offered and provide service that, as compared with 1920 and, indeed, with several previous years, was vastly superior. Throughout the year there was a surplus of freight cars, which during the height of the business depression in mid-summer reached a total in excess of 500,000.

Threatened Strike

The 12 per cent reduction in railroad wages made by the Railroad Labor Board, effective July 1, did not rest

well with the several railroad brotherhoods and unions and a strike ballot was taken, which the brotherhood and union leaders said was overwhelmingly in favor of a strike. Leaders of the steel plant strike of late 1919 also said the vote of the workmen was overwhelmingly in favor of a strike, but they never produced the tally sheets or any other evidence to support such claims, and the public had only their word for it. The same thing is true of the strike vote of the railroad employees last summer. The leaders said they had the authority to call a strike from the men of their organizations and accordingly the strike orders went forth which were destined to completely stop the operation of the railroads of the country between Oct. 31 and Nov. 5.

Numerous and feverish conferences were held in Washington and Chicago, with much noise from both points and from both sides of the controversy, but suddenly just a few days before all business was to be brought to a standstill by the suspension of railroad operations, the strike order was rescinded. There was some disposition at the time to ascribe the calling off of the strike to a vague promise said to have been made by a member of the Railroad Labor Board that further wage reductions would not be considered until after the board had completed its revision of working conditions, and since this was to take considerable time, the men thereby were assured of the July 1 scales for some time to come. This made good newspaper copy, but the real reason the strike was called off was that the union leaders discovered that the strike entirely lacked public sympathy; that the railroad management actually wanted a strike because there were so many thousands of men, who had secured railroad experience during the period of Government control and later let out, who were idle and would have been glad to be taken back and given high places in the seniority lists which those who struck would have sacrificed; and that to have gone through with the strike would have meant the end of the brotherhoods and unions and the undoing of the years of effort in their upbuilding. Self-preservation is the first law of nature and the union leaders wisely decided that it was better to go along with the economic and industrial readjustment than to take a chance on being dashed to pieces on the rocks of an unpopular strike. A strike occurred on some of the Texas roads late in October, but it was neither general nor of long duration. There were suggestions in the fall of a shortage of coal cars, but this turned out to be nothing more than a cutting down of car placements at mines which had been using cars for storage purposes.

Reductions in Steel Plants

Labor troubles within the iron and steel industry were practically unknown despite rather frequent wage reductions which carried the base or common labor rate from 46c. per hr. with time and a half for work in excess of eight hours back to 30c. an hour, with no overtime payments at the plants of the Steel Corporation and of independent companies having works in the same centers as the Corporation, and to as low as 25c. and even 20c. an hour in some centers. Moreover, the iron and steel industry did not average 50 per cent operations for the year and since during the first eight months of the year the average was nearer 30 per cent, recourse to part time schedules and to a distribution of work, in order that all might have a share, was necessary.

The industry was more disturbed from labor troubles from without than within. Chief of these was the trouble among the building trades, growing out of the efforts of employers to put wages on a basis more in keeping with economic and industrial changes following the collapse of the business boom, and price inflation during the latter part of 1920. The stubborn refusal of the building trades unions to either accept a reduction in wages or to modify working rules and conditions which would have increased production without decrease in rates, precipitated strikes in practically all of the large cities of the country during the year.

Building Interrupted

These disputes interfered seriously with building activities not only physically, but because they caused the postponement of many projects by investors, who, despite the decline in the cost of materials, still were confronted by a relatively high total cost because of the demands of labor. If the building trades had been willing to go along in the readjustment, it is safe to say new construction easily would have been double what it actually was during the year. The lack of houses has been a crying need for the past few years and if labor had been reasonable, two houses probably would have gone up where only one actually has been built. The need of new hotels and office buildings has been only slightly less pressing than new housing and that has been only a slight correction of the shortage may be charged, not against the cost of materials, which all, notably steel, have come down materially in price, but because it has been little, if any, cheaper to have a ton of steel set in place or 1000 brick laid.

Boston suffered first from a building trades strike,

which came Jan. 19, as a result of a reduction in skilled labor rates from \$1 to 90c. per hour and in unskilled labor scales from 65c. to 70c. to 55c. to 60c. per hour, effective Jan. 20. Then followed a period of three months during which employers, and union leaders, were closeted with city and State officials in an effort to bring about a settlement. The conferences failed because of the obstinacy of the union leaders, who would neither accept a wage cut nor modify working conditions to the extent of granting "a fair day's work, for a fair day's pay." The upshot of the Boston affair was a declaration by the employers of the "open shop," the application of which brought results where conferences had failed. Other New England cities had similar troubles. Cleveland had a strike starting May 1, which virtually tied up all building work for a period of five weeks. Pittsburgh had a strike which was fairly effective for a time but which faded out and finally was settled in early fall by the acceptance by the men of reduced scales. Chicago had a siege beginning in May, which was not fully adjusted at the end of the year. If there is a big city in the country which escaped a building trades dispute, the fact is pretty well concealed.

The effect of the building trades disputes upon the demand for steel may be gaged by the reports of the Bridge Builders and Structural Society, which for the 11 months ended Nov. 30, show that the average of fabricated structural steel orders was only 34.6 per cent of the total shop capacity of the country and this despite a drop of 40 per cent in the cost of plain material, which was fully reflected in fabricated material prices. The average price of plates, bars and shapes, which as of Jan 1 was 2.50c. was down to 1.50c. at the end of the year.

Reduced Earnings of Many Companies

Past Year Makes a Decidedly Unfavorable Showing Compared with Prosperity of 1920

From the viewpoint of earnings, 1921 will go down in the history of the steel industry as a decidedly unprofitable year. But, in this respect, the plight of the steel companies is somewhat magnified in the reflection of a series of preceding prosperous years. Even earnings for 1919, a year of serious labor disturbances, now appear favorable in the light of those for the past twelve months.

During the preceding prosperous years, the older steel companies materially added to their surplus accounts, as well as to physical properties. The younger corporations, as well as those starting business in the war years, absorbed a large share of current earnings in plant development. Naturally the last two classes of industry have suffered more keenly than the first.

Small and relatively unimportant steel companies, unable to stand up under rapidly dwindling cash and marketable resources, have been forced into bankruptcy or the management of their affairs dominated by banking interests for the purpose of protecting funds invested in these properties. And yet 1921 was comparatively free from increases in share capitalization and bonded indebtedness. The Bethlehem Steel Co. actually anticipated \$7,500,000 7 per cent notes due in July next. The Lackawanna Steel Co. has materially lessened its liabilities, and the final 1921 balance sheets of other large properties should disclose sound fundamental conditions, notwithstanding decreased earnings records for the year.

According to those quarterly earnings statements issued by the independent steel companies, most of them fared worse than the United States Steel Corporation because of its varied earnings power. The Lackawanna Steel Co. for the first nine months showed a deficit after taxes and ordinary charges amounting to \$1,208,275, after having stopped dividends, whereas for the same period in 1920 there was a \$4,714,370 profit with dividends. The Republic Iron & Steel Co., because of limited operations, ran into large deficits early in 1921, and will make an unsatisfactory annual

statement of earnings. The Midvale Steel & Ordnance Co. experienced one quarterly deficit after allowing for taxes, and its 1921 earnings report will also compare unfavorably with that for 1920. Penn Seaboard Steel's consolidated income account for the first nine months showed larger expenses than gross sales, with a resulting net loss of \$152,365. After allowing for interest charges, its sinking fund, an adjustment of inventory and other items, there was a deficit of \$571,817. And so it goes down the line.

A study of industries over a period of years shows that, after a time when earnings shrink, as a result of a pronounced business depression, a linking up of properties follows in the interest of reduced operating costs. There is no reason to anticipate 1922 will prove an exception. In fact, consolidations of steel, copper and oil properties already are known to be under consideration by banking interests. As regards steel mergers, definite developments will probably be recorded early in the new year. Naturally following 1921 will be a period of years of competition for business and for the refinement of products, when capitalizations, book and liquid assets must combine to yield even a moderate return upon the money invested.

Engineering Standards Discussed at Cleveland

A reception for Dean Dexter S. Kimball, Cornell University, the new president of the American Society of Mechanical Engineers, was given by the Cleveland section of the society Dec. 29. Following a dinner Dean Kimball led in an open discussion on the subject of the general welfare of the engineer. E. C. Peck, Cleveland, chairman of the national committee of standards, spoke on the desirability of establishing standards and outlined the work that has already been done by his committee. He said that 15 standards have already been established and 75 others are being started by the committee.

The Year in Iron and Steel Metallurgy

Developments in Electric Steel—New Features in Open-Hearth Practice—Alloy Iron and Steel—New Theory of Hardness

BY JOHN HOWE HALL*

DURING 1921 continued progress has been made in the development of the concentrating and sintering plant of the Mesabi Iron Co., which is developing a large tract of low-grade iron ore in the Eastern Mesabi district of Minnesota. A very large tract of land containing the ore body is being developed. The ore is a magnetic taconite and is crushed, concentrated on magnetic concentrators and sintered. The first unit of the sintering plant, with a capacity of 1000 tons of sinter per day, is nearly complete, making the first step in a development which contemplates ultimately a production of 30,000 tons of sintered products every 24 hr. It is expected also that eventually a low phosphorus ore may be produced. The product of the plant is already on the market in quantity.

Experiments have been carried out in Canada on the blast furnace smelting of titaniferous iron ores on an entirely different principle from that followed in all previous trials. Heretofore the titanite oxide has been considered as an acid in the slag, and limestone has been used as a flux. In the experiments recently conducted, advantage was taken of the fact that titanite oxide is chemically amphoteric, i.e. it will act either as an acid or as a base, depending upon which is in excess in the slag. Silica was used as a flux instead of limestone and the slags are said to have been entirely satisfactory and the results of the trial most encouraging. Should further work demonstrate the feasibility of this method, a large field will be opened up in the use of titaniferous iron ores, including those which carry a considerable percentage of silica.

Electrolytic Iron Tubes

Experiments are being made on a considerable scale in the production of iron tubes by electrolytic deposition on a rotating mandrel using an insoluble anode. This process has already been developed in France using hot ferrous chloride solution as an electrolyte. It has been found recently in the work done in this country that the solution can be made to greater advantage from iron ore. The metal of the tubes produced runs from 99.97 to 99.99 per cent iron. The tubes when removed from the mandrels are annealed to eliminate the brittleness characteristic of electrolytic iron as deposited. The French metallurgists who have developed the process claim that they are already in a position to compete with other processes for thin tubing.

Blast Furnace and Cupola Iron for Castings

In the new Ford foundry, which is to have a final capacity of 2500 tons of castings per day, four cupolas are now in operation of the 24 which will eventually constitute the complete plant. This is probably the first foundry to undertake the use of direct metal from the blast furnace on a large scale. The iron produced by the blast furnace has run very uniform in analysis, and castings have already been produced on a commercial basis with as high as 80 per cent direct blast furnace iron and 20 per cent cupola metal. This very high percentage of direct iron will probably not be used except in rare cases and probably a 50-50 ratio will be the average. So far most of the castings made have

been poured from a mixture varying between 40 per cent direct to 60 per cent cupola metal, and 60 per cent direct to 40 per cent cupola metal.

The cupolas are mechanically charged by means of cars which dump the stock into chutes of which there are two for each cupola, so that the iron can be charged from both sides. The hot metal from the blast furnaces is brought to the foundry in 75-ton ladle cars, whence it is poured into 20-ton mixer ladles, where it is incorporated with the cupola iron. From the mixer ladles it is poured into regular foundry ladles for distributing to the pouring floors.

High and Low Voltage for Electric Furnaces

A report by the Electric Furnace Association calls attention to the consensus of opinion as to the relative advantages of high and low voltage in electric furnace work. Apparently it is felt that voltages up to 140 are satisfactory, but there seems to be a feeling that voltages of 160 to 250 are not desirable, as the long arc produced by such current is hard on the brick work of the furnace and is supposed to have a deleterious effect on the metal. While it is believed that the harmful effect on the steel can be corrected by lengthening the final refining period, yet most operators consider it better policy to use a lower voltage, which has no bad effect on the metal at any time, rather than first doing harm to the steel for the sake of saving time in melting, and afterward trying to undo this harm in the refining period. It will be interesting to see how far these conclusions are borne out in future practice.

Government Electric Steel Plant

The outstanding achievement of the year in electric furnace practice has been the successful starting up of the two 40-ton Heroult electric furnaces in the Government Armor Plate plant, Charleston, W. Va. These furnaces, which are of the usual circular cross-section, have a shell 18 ft. in diameter and 8 ft. high, are lined 18 in. thick in the side walls and provided with three electrodes, 24 in. in diameter in the case of amorphous carbon and 14 in. in diameter for graphite. The furnaces are, of course, arranged to tilt up for pouring in the usual manner.

Two 75-ton basic open-hearth furnaces are used in the plant to provide hot metal for the electric furnaces. In the open-hearth furnaces the phosphorus is reduced to about 0.015 per cent and the finished steel from the electric furnaces runs a little over this figure on account of slight rephosphorizing from the small amount of open-hearth slag which gets into the furnaces with the metal. The sulphur of the steel so far produced has varied from 0.008 to 0.015 per cent and, of course, the metal has been very thoroughly deoxidized and of the highest quality.

The plant is thus equipped to pour ingots of electric furnace steel up to 80 tons weight and open-hearth ingots up to 150 tons. By mixing the two kinds of metal, of course, even larger masses could be cast.

The successful operation of a plant producing steel of the very highest grade on such a large scale is a land-mark in the already rapid development of electric furnaces, and the designing skill shown in building these large units is worthy of the highest praise. We

*Metallurgical engineer Taylor-Wharton Iron & Steel Co., High Bridge, N. J.

are informed that even larger furnaces are contemplated and that the 100-ton electric furnace will be here much sooner than could possibly have been anticipated a few years ago.

New Induction Furnace

Somewhat to the surprise of electric furnace operators in this country, an attempt is again being made to develop the induction furnace on a commercial scale. In the type being tried out, the primary winding is placed above the crucible in order to remove it from danger of a break-out, instead of placing it on a level with the metal as in most previous designs. As the furnace necessarily operates on low frequency power, a motor generator set is needed to convert the available power to single phase current of low frequency. From the point of view of cost, of course, the expense of this motor generator set has to be compared with that of the transformers of an arc type furnace. A 2-ton unit has been built and is in regular operation for foundry work. In view of the difficulties which have been experienced in the past, especially the practical impossibility of building the lining of the crucible so that it would "stay put," the results of this new experiment will be watched with great interest.

During the year one of the largest producers of manganese steel castings in this country has turned to the use of the electric furnace for the manufacture of manganese steel. Although other makers of this alloy steel are already using the electric furnace, this is the first case, to the author's knowledge, where the electric furnace is contemplated for all or a very large part of the output of one of the leaders in the industry.

Improving Open-Hearth Ports

For a good many years efforts to increase the life of the ports of open-hearth furnaces have been directed chiefly toward the protection of the brick work by water cooling without radical change in the construction of the furnace. The problem has also been attacked in another way by providing spare ports already built up in a movable frame so that replacement could be made in the shortest possible time. Although these methods have, to some extent, expedited repairs and increased the life of ports, yet neither line of attack has been wholly satisfactory.

Recently several very radical changes in the design of open-hearth furnaces have been made with the object not only of increasing the life of the ports but of improving the efficiency of combustion of the fuel and hence the output of the furnace. In a general way the objects aimed at in these different designs are somewhat similar and are based on the idea of securing complete combustion of the fuel in the first few feet of the hearth, and of slowing down the outgoing gases in order to prevent them from coming in contact with the outgoing port at such high speed as to rapidly melt it away.

The Egler Furnace

In what is known as the Egler type a blow torch effect is given to the flame by mixing the air and gas in the port instead of in the hearth. In burning producer gas the object in view is attained by putting positive pressure on both air and gas and bringing the latter to the furnace by means of an up-take flue located in the position usually occupied by the air flue. This vertical up-take is connected with the hearth by a flue or port in the usual manner, but the air instead of being introduced through a separate opening above the gas is brought vertically into the bottom of the gas port through a suitable up-take.

At each end of the furnace are two auxiliary flues which can be closed by water-cooled mushroom valves. These flues are kept closed at the incoming end of the furnace, and those at the outgoing end are kept open.

The area of the passages carrying away the products of combustion is thus greatly increased so that the speed of the outgoing gases is considerably reduced. It has been found that the port temperature is not unduly high, that the roof can be kept cool by admitting a small surplus of air over that needed for combustion, and that a very high hearth temperature and very perfect transmission of the heat to the bath are secured. The time per heat has been greatly reduced and the output of the furnace correspondingly increased. For coke-oven gas and natural gas only one set of regenerators is used, and the gas is admitted to the air port by pipes located one on each side. For oil or tar the fuel is brought in by means of a burner in the end wall.

The McKune Furnace

The McKune design was first tried with by-product coke-oven gas. At each end of the furnace are three up-takes of which the central one is used as a port and the two outside ones at the incoming end are closed by dampers, while the corresponding ones at the outgoing end are open. The air is introduced under a fan pressure of about 6 oz., and the gas is introduced through pipes at each side of the central port. The fuel is burned very completely in the first 10 ft. of the hearth and the results secured in decreased time per heat and increased production have been very satisfactory.

What is called the Venturi line furnace works more or less on the McKune principle and was first developed for producer gas. In this type the port area is decreased by lowering the roof knuckles of the furnace, and moving in the wing walls in such a way as to form knuckles in the side walls, thus restricting the opening in two planes. In addition the mouth of the gas port proper is moved about 3 ft. back from the point of greatest restriction, thereby providing a channel where air and gas may mix before entering the hearth. No pressure is used on either air or gas but, as the furnace is fitted with waste heat boiler, induced fan draft is used.

McKune and Venturi Furnaces

A combination of the McKune and Venturi line type is also being worked out in which water-cooled dampers which are lowered one on either side of the gas port take the place of the knuckles in the side walls of the original Venturi design. These dampers, of course, are lowered at the incoming and raised at the outgoing end. In the first furnace of this type the neck opening is 13 sq. ft. at the incoming end and 31 sq. ft. at the outgoing end. The air is introduced under fan pressure and, as the furnace is provided with waste heat boilers, induced draft is used.

Coke-Oven Gas for the Open-Hearth

In the burning of by-product coke-oven gas trouble has always been encountered because of the tendency of the flame to rise from the bath and to burn without luminous effect. Tar has often been blown into the furnace over the gas in order to give a luminous flame. At one of the large plants it has been discovered that by admitting a small amount of air in the burner a luminous flame can be obtained, and that by varying the amount of this air the flame may be varied at will from non-luminous to very bright. In this plant short shut-downs of the furnaces have been necessary in the past in order to clean the underground flues which bring the producer gas to the furnaces. Arrangements have now been made to bring by-product coke-oven gas to each furnace and, while the producer gas flues are being cleaned, the furnaces are successfully operated on by-product coke-oven gas. Several long runs have been made with the latter fuel alone and one furnace made a run of 55 straight heats with by-product gas.

Benjamin Talbot has taken out patents covering the

design of tilting open-hearth furnaces of much larger capacity than any now built for use in his continuous process. In these furnaces a longitudinal wall divides the hearth of the furnace into two chambers and serves to support the very wide roof made necessary by the large size of the furnace. Passages are provided connecting the two baths and the furnace is arranged to tilt endwise instead of sidewise as in the old design.

Cupolas and Open-Hearths for Duplexing

During the year a very interesting description was published of a large scale experiment in the use of cupolas to provide hot metal for open-hearth furnaces. In the particular plant where this trial was made the four 60-ton basic open-hearth furnaces were fed with hot metal from a single blast furnace, but there was no mixer. During repairs to the blast furnace the furnaces were being run on cold charges of pig iron of which about 20,000 tons was on hand in one large heap, the silicon in the pig varying all the way from 0.50 to 6.00 per cent. Considerable trouble was encountered when a charge consisted largely of high silicon iron, as the bath of course then melted high in silicon with resulting delay in the operation.

Two large spiegel furnaces, each 6 ft. in diameter inside the lining, and 30 ft. high from the bottom to charging door, were used to melt the pig iron for the furnaces. It was found that by varying the amount of limestone charged in the cupola, the amount of silicon oxidized and slagged could be increased or decreased and in this way a good deal was done in reducing the silicon when it was found that a large proportion of the higher silicon iron was being charged. It was thought, when the experiment was started, that the cupolas would not be able to take care of the four open-hearth furnaces, but it was found that keeping them in blast only 18 hr. out of a possible 24 hr., they melted enough iron to furnish each of the open-hearth furnaces with 50 tons of hot metal at regular intervals. During the run about 13,000 tons of iron was melted, and the production of the open-hearth furnaces was increased very considerably over what was possible with cold charges. In fact, in one month the open-hearths produced more steel than they ever had when taking iron from the blast furnace, owing largely to the elimination of delays in waiting for blast furnace metal.

Although, of course, difficulties would necessarily be encountered in operating cupolas continuously and keeping them "in step" with the steel making equipment, yet the author of this article feels that in some instances at least cupola melting of the charges for the open-hearth furnace would be a paying proposition in plants having one or more open-hearth furnaces but no blast furnace to supply hot metal.

A German investigator published an article during the year on the influence of the time at which silicon is added to the ladle in the manufacture of basic open-hearth steel. He concludes that if the silicon is thrown in the bottom of the ladle before the heat is tapped, a greater loss of silicon and more blow holes in the ingots are encountered than is the case if the silicon is thrown in the ladle quite late in the tapping of the heat.

Oil as a Fuel for Cupolas

In Germany a trial was made of the use of oil to replace part of the coke in cupola melting. The oil flame was introduced through the tuyeres and blown against the incandescent bed of coke and the results are said to have been satisfactory and the saving in fuel considerable. From a published description of the experiment, the method appears to have been quite similar to that developed and patented in this country by Bradley Stoughton.

While nothing strikingly new has come up in the use of electric heating for heat-treatment furnaces, yet

continued progress has been made in the design of these furnaces and the number of installations is increasing quite rapidly. In most cases the cost of the electric heating is greater than that of mineral fuel, but this increased cost is offset to a considerable extent by the decrease in repair charges; the freedom from scaling due to the inert atmosphere of the furnace, coupled with the much better control of temperature, makes electric heating highly desirable for an increasing number of applications.

Better Malleable Castings

The Malleable Iron Association has published a report showing the progress made by its members in improving the quality of their product, especially during the last 3½ yr. In that period the average tensile strength of the test bars submitted by the members increased from a little under 49,000 lb. per sq. in. to over 53,000 lb., and the elongation from under 10 per cent in 2 in. to nearly 16 per cent. In June, 1921, the average extension was 15.77 per cent, or over twice that specified by the American Society for Testing Materials. In April, 1921, the average tensile strength of the test bars submitted by members was 53,530 lb., which is more than 8000 lb. over the minimum A. S. T. M. specification. The association feels that it has made great progress in the improvement of the average output of its members, and that the results shown in these test bars are a fair measure of the improved quality of their product.

Centrifugal Steel Castings

Results have been published showing the possibilities of castings both of carbon and of nickel steel made by the centrifugal process. The castings in question were cylinders with walls varying from 0.50 in. to 3.50 in. thick, and the only segregation found in the castings was in a radial direction. By heat treatment of the steel physical properties were secured which suggested the possibility of producing steel by this method with physical properties as good as those of forgings.

New Way to Make Welded Pipe

An interesting new development in the manufacture of welded pipe is a new plant designed to produce hammer welded steel pipe from 24 in. to 96 in. in diameter and with walls from ¼ in. to 1½ in. thick. Open-hearth steel plate is bent either hot or cold, depending on the thickness, by means of rolls such as are used in boiler shops. The lap is then heated with gas burners both inside and outside for a short distance and welded by means of a power hammer working against a suitable anvil within the pipe. Another section is then heated and welded, and so on until the weld is completed. This makes available larger sizes of welded pipe than have heretofore been on the market, which is of considerable advantage as compared to riveted pipes. On account of the friction in the latter a welded pipe of a given size will carry more water than the same size of riveted pipe, or to carry a given quantity of water a smaller-sized pipe may be used.

Stainless Iron

In the field of alloy steels progress has been made in the development of stainless iron, which is an alloy similar in composition to stainless steel, except that the carbon is below 0.10 per cent. This is an electric furnace product and has certain advantages over stainless steel in that it can be used for a wider range of forging, pressing and stamping operations. Already it has been developed on a commercial scale for the manufacture of automobile wheel disks, hoods, bodies, etc.; carbon-free ferrochrome is used in the manufacture of this metal.

Alloy-Iron Castings

Experiments have been made in Germany on the

addition of nickel and cobalt to cast iron. The latter was found to reduce the strength and to increase the hardness and hence to hold forth little promise of usefulness. The nickel in quantities up to 1 per cent raised the bending strength 30 per cent, the compressive strength 30 per cent, and the tensile strength 18 per cent. A large motor corporation in this country is reported to be using 1 to 1.50 per cent nickel in cupola castings and to find the iron harder and to possess better resistance to wear. Small amounts of nickel and chrome are also being tried as additions to car wheel mixtures.

One firm manufacturing electric resistance grids, which are castings of very small section and which must be of gray iron, are melting the metal for these castings in the electric furnace and using from 4 to 5 per cent nickel in the iron. In addition to its effect in increasing the electric resistance, the nickel is said to assist in the formation of graphite as the iron cools, and hence to make very light sections gray and soft.

Molybdenum Alloy Steels

Further data have been published on the influence of molybdenum in small percentages (up to 1 per cent) in nickel, nickel-chrome, chrome and chrome-vanadium steel. The figures which have been published show an increase in strength due to the molybdenum with a simultaneous increase in ductility, especially in the reduction of area. In this same connection tests have been published on cast steel containing 0.27 per cent carbon, 1 per cent chrome, and 0.50 per cent molybdenum, heat-treated by quenching and drawing. The castings showed properties closely similar to those of forgings with a tensile strength of about 99,000 lb. per sq. in., an elastic limit between 65,000 and 66,000 lb. per sq. in., an extension of about 21 per cent, and a reduction in area of over 50 per cent.

Sulphur in Steel

The investigation into the influence of sulphur and phosphorus on steel which is being carried out by a representative committee from various scientific bodies under the chairmanship of the Bureau of Standards has made considerable progress during the year. The tests on the first class of steel selected for work are com-

pleted and the results will soon be published in the form of a Bureau of Standards bulletin. The manufacture of the next class of steel in order is under way.

In this connection it is interesting to note that the American Society for Testing Materials has voted to remove the temporary note allowing increases in phosphorus and sulphur on 14 of their standard specifications. The only exception to this action was to continue in force the increase of phosphorus and sulphur by 0.01 per cent in the case of steel castings and the increase of sulphur by the same amount in the specifications for structural steel for locomotives, cars and ships.

During the year a notable book on the heat treatment of medium carbon steel by a distinguished Italian metallurgist has been published in this country. The most noteworthy feature of this book from the practical man's point of view is the remarkably good results secured by careful heat treatment of nickel steel castings. Indeed, the author ventures the opinion that in some cases a casting may be superior to a forging because the casting is not subject to the transverse weakness often characteristic of a forged piece and most difficult to correct by heat treatment.

New Theory of Hardness

In the field of purely theoretical work the most striking contribution of the year is that of Zay Jeffries, who has put forward a new theory to account for the hardening of metals, known as the slip interference theory. In brief, Dr. Jeffries reasons that every known method of hardening metals can be referred to the principle of slip interference. Mechanical failure under stress is ordinarily premature because of the presence of crystallographic planes of weakness or potential slip planes, and any structural condition which interferes with slip on these planes of weakness increases the strength and hardness of the metal. Conditions which bring this about may be grain refinement, presence of amorphous metal, presence of a strong constituent at the grain boundary, or the presence of hard constituents within the grains themselves uniformly distributed in the form of very fine particles. This new theory has brought out a great deal of discussion.

Buying of Railroads at Low Ebb in 1921

Car Repair Orders Far Exceed Purchases of New Cars, the Latter Being the Smallest Since 1900— Rail Buying at Lowest Point in Years

IN a year of pronounced dullness in the iron and steel market, railroad purchases were conspicuous only because the individual tonnages placed were large in comparison with orders coming from other sources. In the aggregate, however, railroad buying was extraordinarily light and proved a disappointment to those who expected the accumulated deferred needs of several years to force large scale purchases. Just as their hopes were stimulated in March, 1920, when the railroads were released from Government operation and in August, 1920, when they were granted substantial rate increases, their expectations rose periodically during the course of the past year, as, for example, in February with the passage of the Winslow-Townsend bill authorizing the payment of \$350,000,000 due the railroads from the Government, and again on July 1, when railroad wages were reduced 12 per cent.

Optimism Not Justified

The failure of any of these flashes of optimism to find justification in subsequent events is now a matter of history. As early as January, railroads grew more conservative in their expenditures concurrently with a sharp decline in their freight loadings. This attitude was accentuated as their business continued to di-

minish and their costs mounted higher than their returns. By the end of the first quarter, the situation became so acute that the railroads had closed many of their shops and laid off thousands of men in an effort to reduce their costs. Repair work was postponed indefinitely, with the result that the number of bad order cars increased markedly. By the middle of May, buying had dropped to a low ebb, purchases being confined to small miscellaneous supplies for shop storekeepers' stocks. At that time, railroad stocks of all classes of material, steel included, were not more than one-half what they had been at the beginning of the year. Not only were the railroads unable to make new purchases, but they were also unwilling to receive shipments against previous orders. Releases against rail contracts dropped off sharply, with the consequence that rail mill operations were adversely affected. On May 19, it was recorded in our columns that five of the strongest Western lines had not laid a rail since the first of the year, despite the fact that some of their 1921 rails had been delivered. One of these roads, in fact, had received 60,000 tons which it had put in storage.

General Desire to Postpone

One reason for the inactivity of the railroads during

this period was a desire to postpone all work possible until railroad wages were reduced. And it is a fact that most of the railroad purchases of the year followed the wage cut of July 1. This buying, however, is probably attributable more largely to the fact that freight traffic revived in the last half of the year and net profits replaced the deficits suffered by the carriers in the early months of 1921. In the buying which did ensue, primary attention was given to car repairs. Of 41,040 cars let for repairs, as reported in our columns, contracts for all but 7000 were awarded in the last five months of the year. Besides the repairs let to private shops, there was some work done by the railroads' own forces, of which we have no record. In comparison with orders for repairs, purchases of new cars were insignificant. According to our records, orders for freight cars by domestic purchasers total 18,040 for the year, of which 12,440 were placed in the last quarter. It seems probable, therefore, that when complete figures are available for the entire year, the total for 1921 will be below that of 1919, 25,899 freight cars for domestic service which was the lowest since 1900. The full significance of the year's orders is grasped when it is realized that the total is hardly more than 10 per cent of the average annual purchases for the 13 years, 1901 to 1913 inclusive, which amounted to 180,000 cars. The 1921 total is also small compared with the average of annual orders during the period of light buying from 1914 to 1920 inclusive, which was 96,000 cars.

Passenger Equipment

Purchases of locomotive and passenger equipment were equally light. Orders for passenger cars in 1921, as recorded in our columns, totalled only 240, less than were ordered in any year since 1900, except in 1918 when 131 were bought. Orders for locomotives, as reported in our issues throughout the year, totalled only 255, the smallest number ordered in any year since 1900, and comparable with the small total of 1919, which was 272. The lack of buying during the past year is appreciated when one compares the number of locomotives bought with the average of purchases from 1901 to 1913 inclusive, which was 3800, and with the purchases during the period of curtailed buying from 1914 to 1920 inclusive, when the average was 1938.

The restricted buying during 1921 was accompanied by sharp declines not only in the prices of railroad rolling stock, but also of steel. During 1920, prices of cars and locomotives reached their peak. Mikado-type engines of 330,000 lb. weight brought as high as \$70,000 each, whereas 50-ton steel box cars cost as high as \$3,600. During the past year, prices of freight cars have been reduced 30 to 35 per cent and locomotives 25 to 50 per cent. On the other hand, the sharp reduction in steel is appreciated when it is recalled that the peak price for tank plates in 1920 was 3.75c., f.o.b. Pittsburgh, as against 1.50c. at the present time, a reduction of 60 per cent. Going back only so far as Jan. 1, 1921, when the market on tank plates was 2.65c., f.o.b. Pittsburgh, the reduction amounts to 43 per cent. The decline in steel becomes even more impressive in view of the fact that the Pittsburgh basing on tank plates as well as on structural shapes and bars, was openly abandoned in the Chicago market in August and from that time on car builders obtained prices f.o.b. Chicago, which were practically on a parity with prices quoted in the Pittsburgh district.

Rail Buying Very Light

Rail buying was extraordinarily light in 1921. Although complete statistics are not available, our records show orders for only 399,000 tons of which all but 51,400 tons are for 1922 delivery. At this time a year ago, most of the tonnage for 1921 rolling had already been placed, but this year the carriers are unusually tardy in making reservations for their requirements, the only orders of any size which have been placed, being those of the New York Central, Southern Pacific and Norfolk & Western for 125,000, 44,600, and 40,000 tons respectively. The tonnage thus far placed for the coming year is exceedingly small as compared with the annual consumption of rails in this country as disclosed by

statistics compiled by the American Iron and Steel Institute. During the 13 year period before the war, rail consumption ranged from a minimum of 1,726,224 tons in 1908 to a maximum of 3,654,794 tons in 1906, and during the years 1914 to 1920 inclusive, ranged from a minimum of 1,568,408 tons in 1919 to a maximum of 2,440,755 tons in 1917. Rail mill operations were exceedingly irregular during the course of the year. In the early months, heavy production was the rule. In March the Gary mill made a world's record of 92,600 tons rolled and shipped and in April nearly equalled that figure with 88,000 tons. In May, however, the railroads commenced to suspend shipments against their contracts and it was not until the latter part of the year, when rails were reduced to \$40 a ton, that the railroads again authorized deliveries in any quantity.

Track Supplies Dull

Orders for track supplies were light during the year and most of the business placed was concentrated in the last six months. Prices of these materials declined sharply during the 12 months: track bolts from 4.60c., Pittsburgh, to 3.20c.; standard railroad spikes from 3.65c., Pittsburgh, to 2.15c.; and tie plates from 3c., f.o.b. mill, to 1.90c.

Railroad bridge and building construction was of small proportions in 1921. Among the few projects which were undertaken was the mail terminal building and the Canal and Van Buren street viaducts of the Chicago Union Station, the steel for which amounting to 8160 tons was let the latter part of March. Another important job which went ahead was a large machine shop erected by the Atchison, Topeka & Santa Fe at Albuquerque, N. M.

Railroad buying of machine tools was on an unusually limited scale in 1921. The only order of any size placed during the first half of the year was that of the Santa Fe for \$125,000 worth of equipment for its Albuquerque, N. M., shop. In October the same road placed orders for one 250-ton, one 5-ton and six 15-ton cranes for the same shop. In June the Great Northern closed for \$25,000 worth of equipment. In July the Illinois Central bought \$150,000 worth of machine tools and this was the only purchase of importance until the last quarter when the Toledo & Ohio Central bought \$50,000 worth of tools, the Virginian \$20,000 worth, and the Missouri, Kansas & Texas closed for a list of 86 machines. Other lines which bought in a limited way during the last quarter were the Erie, the Cleveland, Cincinnati, Chicago & St. Louis (Big Four), the Boston & Albany, the Union Railroad and the Santa Fe.

Inquiries Pending

As the new year opens, several large inquiries for cars are pending and a number of extensive lists of machine tools are being figured on and others are being prepared. The year 1921 was exceedingly unsatisfactory from the standpoint of car and locomotive builders and machine tool manufacturers and all are glad that the year is now behind them. The same may be said of those makers of iron bars, bolts and nuts, springs and malleable castings whose chief business is with the railroads, as they too experienced a very discouraging year from the point of view of both orders and profits. In looking ahead into the coming year, better business is expected, although the railroads themselves are regarded as the chief remaining obstacle to a return to normal industrial activity. Substantial reductions in freight rates and if necessary to that end, further cuts in the wages of railroad employees are generally considered essential to complete the economic readjustment which has been going on during the past 12 months.

The Ohio Structural Steel Co. has established a plant at Newton Falls, Ohio, where it is equipped to handle structural and fabricated steel work of a not too complicated nature. M. H. Stauffer, formerly of the Niles Forge & Mfg. Co., Niles, Ohio, is president and general manager. J. S. Mitchell, formerly with the Kansas City Structural Steel Co., Kansas City, Mo., is the company's chief engineer.

The Status of the Electric Steel Industry

United States Still Leads with 388 Furnaces, A Net Gain of
About 9 Per Cent in 1921—Furnaces in the World's
Steel Industry Probably 1000

BY EDWIN F. CONE

DESPITE the acute depression prevailing in the steel industry last year, the expansion in the electric steel industry in 1921, as measured by the number of new installations of various types of furnaces, was practically equal to that in 1920. This is an unexpected development. No attempt has been made in this year's review to obtain data regarding other countries than the United States and Canada.

On Jan. 1, 1921, according to THE IRON AGE's annual review of the electric steel industry, published in the issue of Jan. 6, 1921, the United States was credited with 356 furnaces of all types, with 43 in Canada; on Jan. 1, 1922, these totals have been increased to 388 in this country and 50 in Canada. This compares with only 19 such furnaces in the United States and 3 in Canada on July 1, 1913, or nine and one-half years ago. The total in the world on Jan. 1, 1921, was estimated at 961. From facts known and deductions that are possible, the estimated number of all types in the world as of Jan. 1, 1922, is easily 1000 and probably more.

A review of this industry was inaugurated by THE IRON AGE when the first data were published in the issue of July 1, 1913. The German paper, *Stahl und Eisen*, made the first estimate of this nature, which THE IRON AGE amplified for its issue of April 14, 1910. That review showed 114 furnaces of all types in all countries; 29 of them were Heroult furnaces. In 21 years, therefore, the world's electric steel industry has expanded close to 10 fold.

The review which follows gives as complete data as was obtainable regarding every type of furnace. Concerning one prominent type no data were reported by the seller and, as indicated in the tables, one or two other selling companies could not see their way to supply information this year. In such cases, where reliable data could not be obtained from other sources, this information as of Jan. 1, 1921, was left standing. It is acknowledged that this results in incomplete data for the whole industry, but the general trend is indicated, despite the facts that some furnaces may be entirely out of commission.

Progress in the United States and Canada

THE net increase in the number of electric furnaces in the United States in 1921 has been 32 against 33 in 1920; 36 in 1919; 54 in 1918; 97 in 1917 and 63 in 1916. The total on Jan. 1, 1922, was 388 as compared

Table of Greaves-Ritchie Electric Steel Furnaces Installed or Contracted for in the United States on Jan. 1, 1922, as Sold by the Electric Furnace Construction Co., Philadelphia

Company and Location	Size, Tons	No of Furnaces	Product
U. S. Navy Yards at:			
Norfolk, Va.	6	1	Castings
Puget Sound, Wash.	6	1	Castings
Mare Island, Cal.	6	1	Castings
Charleston, S. C.	3	1	Castings
Philadelphia, Pa.	3	1	Castings
Total		5	Castings
American Radiator Co., Buffalo, N. Y.	6	2	Castings

Total in the United States, 26; Canada, 2.			

There have also been sold a 1 1/2-ton furnace to the Imperial Japanese Mint, Osaka, Japan; a 1-ton furnace to Brazilian Military Commission, and a furnace to the Sociedad Espanola de Construcion Naval, Madrid, Spain, for making ferroalloy.

The Ford Motor Co., Highland Park, Mich., recently purchased 4 electric brass-melting furnaces from the Electric Furnace Construction Co.

with 356 on Jan. 1, 1921; with 323 on Jan. 1, 1920; with 287 on Jan. 1, 1919; with 233 on Jan. 1, 1918, and 136 on Jan. 1, 1917. The apparent net increase of 32 furnaces in 1921 is less than the actual, due

either to the passing out of commission of some installations or to cancellations of contracts, some of which were not reported.

The expansion of the American electric furnace industry may be appreciated when it is recalled that on July 1, 1913, there were only 19 furnaces using electricity. The expansion is therefore over 20 times.

Table of Volta Electric Steel Furnaces Installed or Contracted for in the United States and Canada, Jan. 1, 1922, as Sold by the Volta Mfg. Co., Ltd., Welland, Ont., Canada

Company and Location	Size, Tons	No of Furnaces	Product
United States:			
Union Electric Steel Co., Carnegie, Pa.	6	2	Steel
Canada:

Total in Canada, 11; in United States, 2.			

The FitzGerald Laboratories, Inc., Niagara Falls, N. Y., has a 1-ton Volta furnace for making brass.

The T. Waddell & Sons Co., Ltd., Christchurch, New Zealand, has a 6-ton Volta furnace, Heroult type, for making steel.

Two Volta furnaces are making ferro-silicon and ferro-chromium for two Canadian companies.

In Canada the industry shows a net gain of 7 furnaces in 1921. The actual gain is larger, but the total increase is explained in part by the fact that a more complete report of the Volta and other installations was possible the past year than the previous one. Our record shows 50 furnaces in Canada on Jan. 1, 1922, as against 43 on Jan. 1, 1921; 19 on Jan. 1, 1917 and only 3 on July 1, 1913.

The net increase in the two countries has been 39

tion of this will be published in a later issue of THE IRON AGE.

Conspicuous among sales of new furnaces in 1921 is the Greene with the reported sales of 5 furnaces as follows: Los Angeles Foundry Co., Los Angeles, Cal., one 1 1/2-ton furnace for hard iron; Greene-Shaw Co.,

these are significant as marking a contract for the largest electric furnace ever built and also as revealing plans for the largest electric steel plant in the country though definite announcement of this has not been made. The three new contracts referred to are two 10 to 15-ton furnaces and one 50 to 60-ton furnace for the Ford Motor Co. These supplement a 3-ton and a 1/2-ton of the same type in use for some time.

For the first time it is possible to publish a table of the installations of Volta furnaces. Previous to this only estimates have been available. Of these there are 2 in the United States and 11 in Canada, the furnace being distinctly a Canadian development.

The table of general furnaces includes some that were not published a year ago, mostly Canadian instal-

*A Ludlum 3-ton furnace has been sold to the Consolidated Rolling Mills & Foundry Co., Inc., New York, for installation in Chile. There are also 9 Ludlum furnaces of special type making various ferroalloys for the Metal Alloys, Inc., Watervliet, N. Y. The Andes Electric Corporation, Conny Island, N. Y., also is using a special 3-phase Ludlum furnace for smelting tin ores.

†Four Vom Bauer furnaces have been sold for installation in Japan, one 6-ton furnace to Le Flaine et Cie., St. Etienne, France, and one 3-5 ton furnace to Consolidated Rolling Mills & Foundries Co., Mexico City, Mexico, for castings.

Table of the Number of Electric Steel Furnaces in the United States and Canada

Type	U. S. 1922	Canada 1922	U. S. & Canada 1922	U. S. & Canada 1921	U. S. & Canada 1920	U. S. & Canada 1919	U. S. & Canada 1918	U. S. & Canada 1917

*Estimated.
†No report; data left same as year ago.

Berkeley, Cal., one 1/4-ton for iron and steel; Eagle Brass Co., Seattle, Wash., two 250-lb. furnaces for monel metal, iron, etc., and the Columbia Steel Co., Portland, Ore., one 1 1/2-ton for steel.

The Greaves-Etchells furnace is credited with three new installations in 1921. Though not large in number

lations. These are based on Canadian Government records and account in part for the net increase in furnaces in Canada for 1921.

Data regarding the Moore and Pittsburgh furnaces were unobtainable from the sellers as in previous attempts to compile this review, but from data obtained from several sources it is possible to publish this year our estimate which is probably nearer the total than in past years. This estimate credits this type of furnace with 36 furnaces as contrasted with 24 a year ago.

An interesting fact is the sale of two Detroit rock-ing furnaces in 1921 for use in the iron industry. This is primarily a non-ferrous electric melting furnace. The new installations include one 1-ton furnace, 300 k. v. a., at the Homestead Valve Mfg. Co., Homestead, Pa., for making gray iron and semi-steel valve bodies and one 1-ton furnace, 300 k. v. a. for producing gray iron and semi-steel castings.

One new installation of a Rennerfelt furnace is reported for 1921 at the plant of the Vaughan Motor

Works, Portland, Ore. It is a $\frac{1}{4}$ -ton furnace for steel castings.

No data were available from the sellers of the Von Schlegell or Booth furnaces. Statements were received that there had been no change in the Ludlum, Snyder

or Grönwall-Dixon lists as published a year ago.

One of the tables shows the number of furnaces by types in the United States and Canada as of Jan. 1, 1922, as well as the total of the two countries, compared with recent years.

Developments in the World

NO attempt has been made this year to obtain data regarding the progress of the electric steel industry in other countries than the United States and Canada. It is probable that this will be possible later. In this review published Jan. 6, 1921, covering the year 1920, data regarding the various types of furnaces in these countries were published including a table which gave known and estimated figures for all countries and all types. According to this there were 562 electric furnaces of all types outside the United States and Canada. Of these 131 were Heroult, 85 were Rennerfelt, 65 were Greaves-Etchells, 7 were Snyder and 6 were Vom Baur, with other types estimated at 268. England led with 150, Germany following with 100 and France with 69 furnaces. Italy and Sweden were credited with 50 each, Norway and Austria (with Hun-

gary) with 20 each, Japan with 11 and Spain and Luxembourg with 10 each.

It is known that these totals have been increased recently so that it is safe to say that, allowing for additions and discontinuances and adding the present total of 438 in the United States and Canada, the world's total is easily 1000.

Of the total installations the United States is credited with 388 or practically 39 per cent. In the production of steel and iron in electric furnaces, this country easily leads all the rest with a capacity probably equal to the total of the other countries combined.

Outstanding in the progress of 1921 is the introduction of the electric furnace into the manganese, steel and the gray iron foundry industry—a movement sure to expand.

Hope for Improvement in Export Business

No Decided Change Is, However, Expected This Year
Owing to Disturbed Conditions in Europe—
Japan a Good Customer

FOR American exporters, 1921 was largely a year of liquidation and retrenchment. A number of prominent exporting companies liquidated, many smaller exporters reduced their personnel to a minimum and several American branches of foreign export houses were closed because of the depressed condition of business. Although the majority of exporters look forward to the coming year as a period of improvement, but slight approach to normal business is expected in view of the unsettled condition of almost all foreign market.

Throughout the past year, Japan has been practically the only active market and this situation is expected to continue for the greater part of next year. In the first quarter, Japanese buying assumed fairly large proportions, continuing until about June when the effect of German competition began to be felt by traders with the Far East. At this time it was variously estimated by Japanese exporters that from 70 to 80 per cent of Japanese buying was being done in the United Kingdom and Continental markets, the remainder coming to the United States. This competition was confined to a great extent to light rails, bars, wire and wire products. The report of a Japanese warehouse company on warehouse stocks for the first ten months of this year shows a decrease in the value of iron and steel on hand. Compared with this company's figures for November, 1920, when warehouse stocks were estimated at about 57,000,000 yen (\$27,360,000), November, 1921, showed stocks in warehouses of the principal ports and cities, valued at about 19,000,000 yen (\$9,120,000).

Japan Purchases Sheets

Japan purchased about 54 per cent of the sheet exports of this country during the first 10 months of the year. The majority of these orders were for Nos. 31 and 31½ gage black sheets, much of the business in heavier gages going to British mills. A large part of these sheets was galvanized in the Japanese galvanizing plants. To protect this infant industry, a duty of about 30 yen (\$14.40) per ton is imposed upon imports of galvanized sheets, compared with about 5.50 yen (\$2.64) per ton on plain black.

Imperial Government purchases have been largely

confined to rails and locomotives. The year's purchases for the Imperial Government Railways alone are estimated to total about 50,000 to 60,000 tons of 60-lb., 75-lb. and heavier rails and light rail purchases were swelled by both Government and private buying. Although buying of copper was fairly active during the year, the total shipments during the first ten months placed Japan in fourth place among foreign buyers of American copper. For a short time, activity was noted in structural material for bridges, which were being erected to replace old bridges in the vicinity of Tokio. More than a dozen bridges were purchased in the United States, which represents only a small percentage of the total of more than a thousand, which will eventually be bought for erection in and near Tokio. Construction of new buildings in Tokio, Osaka and other large cities resulted in a few tonnages of structural steel and as the trend toward modern fire-proof office buildings in Japan is evidently continuing, the ensuing year may see further purchases for this purpose.

Large Electrical Equipment Contract

One of the largest contracts placed in the United States during the year was for about \$2,000,000 worth of electrical equipment, awarded by the Tokio Electric Light Co., to the Westinghouse International Co. Another smaller order called for about \$600,000 worth of equipment for the Daido Electric Power Co. Electrification of the Government railroads is in progress, opening prospects for future purchases, many of which may be made in the United States. In addition to previous rail purchases made by the Imperial Government Railways, about 13,000 tons of 60-lb. and 75-lb. rails was awarded during the last week of December by the Government and decision was also made on the purchase of 5500 tons of 100-lb. rails for the Hanshin Electric Railway.

The South Manchuria Railway Co., Japanese owned, placed a number of orders in the United States during the year. The purchasing of this railroad, which is fairly regular, averages between 350,000 yen (\$168,000) and 400,000 yen (\$192,000) per month. In 1919 purchases totaled about 10,600,000 yen (\$5,088,000) and in 1920 about 6,146,186 yen (\$2,950,169).

These purchases did not include buying done in the United Kingdom, Germany and elsewhere. In prospect for 1922 is the material for hydro-electric projects, particularly a large one on the island of Formosa, material for the electrification of railroads in Japan, structural steel for bridges, new office buildings and other buildings in the cities, the usual rail requirements of the Government railroads, municipal street car lines and private mining, lumbering and other enterprises and the usual consumption of black sheets. A number of sheet orders have been booked by Japanese export houses and placed with American mills for January-February delivery, as well as orders for wire and wire nails.

South American Conditions

Early in 1921, South American markets were in a chaotic condition, practically all the principal ports of South American countries being congested with canceled material. The greatest supplies were at Buenos Aires, where the two leading interests and numerous small exporters were holding stocks of canceled material. While a large part of this material was rendered practically useless by exposure to the weather, some was sold at heavy losses and a not inconsiderable part is reported to have been re-exported to other markets. Gradually the situation was cleared and although South American markets will probably not enter into American exports as a factor in 1922, there will undoubtedly be some purchasing on a scale slightly greater than in 1921.

Construction contracts have been let to American builders in Chile, Brazil, Bolivia, and Argentina and other countries and the development of oil fields in Chile, Argentina, Bolivia and Venezuela will doubtless result in the exportation of oil well equipment, tanks, pipe and pumping machinery. The Westinghouse International Co. received part of a railroad electrification contract for Chile, the locomotives being awarded to the American Locomotive Co. The Chilean State Railways closed on about 20,000 tons of heavy rails and about 400 cars in November, placing the rails in Germany, for the first time in about 20 years, and the cars with two American builders. A project is reported from Colombia for railroad construction, which, if carried through, would eventually involve the purchase of a large tonnage of heavy rails as well as locomotives and cars. This project is in line with the Colombian Government's intention of spending the \$25,000,000 indemnity for Panama, when it is received from the United States Government. The railroad contract for 128 miles of standard gage track, on which the Ulen Contracting Co., New York, is working in Bolivia, will result in inquiries, according to the contractor, in February or March, when the engineering is completed and construction begins. A number of steel bridges and a tonnage of 60-lb. rails will be included.

Locomotives for Mexico

The National Railways of Mexico have purchased a total of 216 locomotives, heavy and light, of which slightly less than half were second-hand. Rail requirements have been handled satisfactorily by the Monterey Iron & Steel Co., which is at present engaged in executing an order for about 25,000 tons of rails for the Mexican railroads. The Mexican railroads are in need of adequately equipped repair shops. Although there is an ample supply of standard gage freight cars for present conditions, standard gage passenger coaches and narrow gage passenger coaches and freight cars are needed. Purchases, however, can only be made when generous credit terms are extended.

Early in the year Germany was not yet a large factor in international markets, but by June, competition of German products was being rather severely felt by American exporters. A number of fairly large rail and structural steel orders were booked and the Japanese, who had been notably active in purchases of wire and wire products in the United States, began buying in Germany and England, because of lower prices. The low quotations made by German wire mills stimulated

an interest among American consumers and negotiations were instituted on several large wire nail orders.

Policy of German Companies

Although numerous representatives of German mills and export houses have established themselves in New York this year, the depressed condition of the American market has precluded any large transactions, but there has been some activity on the part of American exporters, who have purchased German material for shipment to foreign markets. The large German interests, such as those of Stinnes and Thyssen, do not look with favor upon any attempt to export iron and steel to the United States on a large scale, believing that such business would not be sufficiently remunerative or last sufficiently long to offset the antagonism that would be aroused.

Following the short period when German mills were booking orders from all markets, the decline of the mark stimulated not only foreign but domestic German purchasing. Exporters and dealers in Hamburg, Rotterdam and other ports filled available warehouses with material to replace their paper marks, which were daily declining in value. This unusual buying activity served to stimulate German prices and as the American iron and steel market declined, the German market rose. To-day, from a price standpoint, Germany is competing with American products in foreign markets on a very much reduced price margin. German interests during the year accepted a number of orders, chiefly for railroad material and equipment and agricultural machinery, from the Russian Soviet Government, extending long terms of credit.

Railroad Material for China

China became active for a short period during the year, purchasing rather heavily of railroad material and equipment. Heavy rails and a large number of locomotives and cars were placed in the United States, but on some of this material, difficulty has been encountered by the sellers in finding financing. China was also active for a short time in purchasing copper for minting, but the unstable political situation curtailed this considerably. Several large tonnages of second-hand plates and shapes, used extensively by Chinese blacksmiths, were shipped by American exporters and Chinese buyers inquired in most cases unsuccessfully for wire shorts. There was some activity in electric units and machinery and machine tools.

Some sales of imported semi-finished material have been made in the American market during the year and a considerable tonnage of pig iron has been sold on the Pacific Coast, where high railroad freights eliminated Eastern iron. According to Paul G. Leoni of the Iron & Ore Corporation of America, 11 Broadway, New York, an active importer of foreign pig iron and some semi-finished material during the past year, there have been imports from Belgium, Luxemburg and Germany but most of these sales were made in September and October, when American pig iron was higher and European iron cheaper. Pig iron sales were then made at \$18 to \$19 per ton, c.i.f. Atlantic ports and \$26 to \$30 per ton, c.i.f. Pacific ports. Since then the situation has changed. American prices have declined and European prices increased and since November none of the negotiations for foreign pig iron, which were pending, has led to any results, notwithstanding reports to the contrary.

Outlook for This Year

At present, European prices are about \$17 to \$18 per ton, f.o.b. European ports, and as the freight rate to Atlantic ports is about \$4, the delivered prices cannot compete with the American quotations, except, perhaps, in special cases where the consumer is located close to a port. On the Pacific Coast there is still an advantage in importing European pig iron and several sales were made during December at prices between \$24 and \$26 per ton, c.i.f. port. The outlook for 1922 depends on the developments in both the European and American markets. It is, however, likely that there will be a close race between foreign and domestic pig iron and there may be times when importation will be possible.

However, if the new tariff goes through, providing a duty on pig iron of \$1.25 per ton, the chances for importing foreign pig iron in the East will not be great.

Movement of Foreign Ores

Imports of iron ore are also dependent upon freight rates. European iron ore, suitable for making foundry iron can be imported at from 8c. to 9c. per unit, c.i.f.

Atlantic ports and in view of the special freight rates on imported ores, which have been established lately for Virginia and Pennsylvania points, some business in foreign ore may be expected when demand increases.

Low phosphorus iron ore is quoted at present between 10c. and 25c. per unit, according to quality, but no sales of any importance have been effected, because of the lack of demand for low phosphorus pig iron.

British Iron and Steel in 1921

The Slump in Output and Prices—Continental Competition— Conditions Nearing Normal as Year Ends

LONDON, ENGLAND, Dec. 15.—Since the slump of 1879 which still lives in the memory of British ironmasters as the most disastrous period in the history of the trade, no more difficult times have ever been experienced than those through which the iron trade has passed during the last 12 months. The transition from prosperity to acute depression came with almost the rapidity of a thunderbolt. Production has fallen to the lowest level recorded for several decades, and the collapse in prices has been wholly unprecedented since the iron industry was established.

The Slump in the Industry

It was of course the inflation of values which in the first instance was responsible for the slump. Prices had reached an impossible level. Foreign consumers with depreciated exchanges were simply unable to pay the price for British iron and, in consequence, we have witnessed an almost complete surrender of our overseas trade.

But that does not mark the full extent of the blow. Cleveland, our leading producing area, has not only lost its overseas markets, which in pre-war days represented a trade of about 750,000 tons per annum, but in addition the home markets have been invaded and for months past our ironmasters have had the mortification of witnessing a constant influx of pig iron pouring into the Tees from continental ports, while their own blast furnaces were standing idle. For months past also Cleveland has been shut out of the Scottish market which has always been the mainstay of the local pig iron trade.

This diversion of the normal flow of trade has been entirely attributable to the fact that France, Belgium and Germany, aided by the vagaries of falling currencies, have been able to undersell us both at home and abroad, and the effect of this is seen in the fact that whereas the exports of pig iron from the Tees during the 12 months ended Oct. 31, 1920, were 470,794 tons, they fell in the ensuing 12 months to 125,730 tons, while the imports from abroad, which in the 12 months ending Oct. 31, 1920, amounted to the negligible quantity of 4,668 tons, reached in the ensuing 12 months 78,293 tons. Indeed, in the latter months of the year the imports far exceeded the shipments both to foreign and home ports.

High prices in the first instance precipitated the slump and it is true that, even before the coal strike, many furnaces had been put out of blast, the position being that on the day before the miners ceased work only 41 furnaces were operating on the Northeast Coast, against a normal average of 72. But the plunge to disaster was rendered deeper and more rapid by the ill-advised action of the coal miners in their declaration of industrial war.

The Pig Iron Output

The miners themselves suffered severely but their own sufferings were as nothing to those inflicted upon

the iron and steel trade and upon those who depended upon it for a livelihood. For three months the industry was entirely at a standstill and, even after the miners got back to work and fuel was again available, very little pig iron was produced on the Northeast Coast and in October, which is the last month for which the figures of production are available, the total output of pig iron was less than half the quantity produced in March, the month preceding the coal strike.

The Cleveland pig iron output for the year is likely to be no more than 40 per cent of the production in 1920. The furnaces now in blast number 24, whereas at the end of 1920 there were 72 in operation and the chief problem engrossing the minds of ironmasters at the present moment is how to get these idle furnaces back to work again. It is simply a question of prices. There is no sentiment in business and if the British or foreign consumer finds that he can buy continental iron cheaper than Cleveland iron, nobody expects him to be patriotic at the expense of his pocket. Indeed, the local steel makers themselves, though in most cases owning their own blast furnaces, have preferred to keep their blast furnaces idle, and to use foreign pig iron and scrap, rather than face the high costs of production involved in smelting their own pig iron.

Extent of the Price Decline

The great problem therefore has been to reduce prices, and in this direction remarkable results have already been achieved. At the beginning of the year No. 3 Cleveland G. M. B. pig iron was quoted at 225s per ton; today it is offered at 100s and even yet the trade is convinced that the end of the downward movement is not reached. This rapid descent to the lower level of values has only been rendered possible by the sacrifices of employers and employed.

The ironmasters have not only abandoned all profits but are actually now producing at a loss, while the wages of the blast furnacemen have fallen from 170¼ per cent above the standard to 77¼ per cent above it. Equally drastic have been the sacrifices made by the Cleveland ironstone miners. Their wages have fallen about 9s per day and they have further voluntarily agreed to sacrifice a guaranteed minimum of 8s per day, consenting to the regulation of earnings entirely by output as a further means of assisting the revival of industry. Even yet prices have not fallen to such a level as to shut out foreign pig iron, except perhaps in the Tees ports.

In other areas the high cost of transport added to the price of Cleveland pig iron brings up the figure to such a level that the foreigner can still compete successfully. The costs of production are steadily falling and it is hoped that the railroad companies will promptly make substantial reductions in rates. Moreover, fuel costs are dropping and the day seems now not far distant when British furnaces will be able to cope successfully with foreign material.

At the beginning of the year there was an export premium of 22s 6d per ton on Cleveland pig iron; that is to say, the Cleveland makers demanded 22s 6d per ton more from the foreigner than from the home consumer. On Jan. 7 the export premium fell to 20s per ton, and on Jan. 25 it fell to 5s per ton. Since then there have been occasional periods when iron was offered at home and abroad at the same figure but for the most part the export premium was maintained at 5s per ton. The following table shows the price changes in shillings during the year so far as they relate to No. 3 Cleveland G.M.B. which is the standard quality upon which all wage ascertainties are based:

1921	Home	Export
Jan. 1	225	247 1/2
Jan. 7	215	235
Jan. 25	215	220
Feb. 1	195	200
March 1	150	155
April 5	120	125
Nov. 1	110	115
Nov. 28	100	105

It should be added, in explanation of the above figures, that they are the official minimum prices agreed upon by the Cleveland ironmasters committee and, during the scarcity occasioned by the coal strike, the price of No. 3 actually ran to 140s but speedily relapsed when production was resumed.

The following summary compares the average officially ascertained price of No. 3 Cleveland G.M.B. in the past two years:

	1920		1921	
	s.	d.	s.	d.
First quarter	178	3 18	198	1 31
Second quarter	203	8 36	126	11 56
Third quarter	217	6 31	131	6 13
Fourth quarter	224	5 37		
Year's average	205	11 95		

The Steel Situation

As regards the steel industry, the beginning of the year found makers with clean order books and prices somewhat removed from the highest levels reached in 1920, but still exorbitant. The boom of the previous year had enabled makers to become independent and to put up prices heedless of what the future would bring. Costs were undoubtedly high, but there was little justification for maintaining selling values at such levels. Taking into consideration the fact that continental works were beginning to get into swing again, one would have thought that the steel makers would have made some attempt at any rate, to avoid what was the natural course of events, namely, acute continental competition, by making drastic reductions, but this was not the case and throughout the year steel prices in this country have simply been cut by dribblets, except toward the close, when a bold bid was made. Continental competition began to make itself felt in January, taking the form of under-cutting in the sheet trade, and our old overseas markets were temporarily lost to us, heavy tonnages finding their way to foreign destinations, chiefly South America and the Far East. Subsequently good railroad material orders were booked by the continent and plants here began to shut down for want of orders.

The Coal Strike

With the government control of the coal industry coming to an end on March 31, the coal miners declared war on the nation and thereby struck the greatest blow to the steel trades. Most works had to shut down entirely and production in consequence fell to practically nothing. When the strike was settled three months later, steel makers found themselves with empty order books and thoughts concentrated upon where business was to come from and how they were to get their prices down. During the period of complete stagnation, continental works saw their opportunity and with the rate of exchange favorable to them, very large quantities found their way to other

foreign markets while such home consumers as were enabled to carry on were forced to import their supplies from abroad. These latter sales consisted in large part of semi-finished steel. Subsequently, Belgium began to have industrial troubles and other continental countries, from one cause or another, got very much behind hand with deliveries of finished material and, as in most cases the steel was required urgently, a number of orders were cancelled and were booked with works here though at slightly higher figures.

In semi-finished steel, however, British prices fell to competitive levels with the result that continental sales in this direction diminished and gradually ceased. In November British steel makers of shapes, etc., finding that there were orders to be had, abandoned ideas of profits and made cuts which, though insufficient to oust continental competition, nevertheless gave certain buyers a little more confidence and orders began to dribble in again, though only sufficient to keep plants partly employed.

In Scotland where the depression had been at its worst, the placing of the Admiralty contracts for three new capital ships, had caused a certain amount of encouragement and employers and employees alike were looking to activity for some time. The suspension of these orders, however, as a result of the naval holiday proposed by the Washington Conference brought disappointment. This feeling, however, was soon overcome, it being realized after all that the limitation of armaments would in the end prove not only a benefit to the nations but to the steel industry as well.

Throughout the whole year shipbuilding, generally speaking, has been stagnant so far as new orders are concerned and ship repairs were sent freely to the continent, where they could be effected at probably half the home cost.

Activity in Tin Plate

An exception to these remarks must, however, be taken with regard to the tinplate industry. Upon the cessation of the boom in 1920, prices began to fall and whereas 77s a basis box was the highest price paid by December of that year, values had fallen to 33s basis. This year, except for minor fluctuations, quotations have dropped and a basis box is now worth about 21s. The trade of course suffered severely during the coal strike, but recovered comparatively rapidly, there being no competition to meet except from America. True, Germany was a seller at one time at competitive prices, but heavy tonnages changed hands, and to-day Wales stands as the cheapest seller. Export business has been moving better, but has naturally been limited in the case of those markets where the exchange rates are adverse. The Far East has been quite a fair buyer, but latterly the demand from that quarter has subsided. Much encouragement given to Wales was the securing of 150,000 boxes for British Columbian packers in face of keen competition from United States manufacturers.

Comparative Prices

The following are comparisons of prices per ton of leading iron and steel products:

	December, 1920		December, 1921	
	£	s.	£	s.
Steel ship plates	25	0	10	10
Steel joists	24	0	10	0
Steel rails (heavy)	25	0	10	0
Steel billets	15	10	7	10
Marked bars (Staffs)	33	10	16	10
Tinplates, 20 x 14, basis f.o.b. (per box)	1	13	1	1

In connection with the study of corrosion of metals in mine water, 44 specimens of material received from 25 manufacturing companies co-operating in the mine-water tests have been weighed, checked, numbered and polished at the Pittsburgh experiment station of the Bureau of Mines, and placed in certain mines where they will remain possibly six months.

German Industry Had Prosperous Year

Booked into 1922 but Speculative Character of Business

May Result in Some Cancellations—

Details of German Exports

(Special Correspondence)

BERLIN, GERMANY, Dec. 9, 1921.—When the history of the German iron and steel industry comes to be written, 1921 will figure as one of the most remarkable years on record. On casting a retrospective glance on the trend of developments during this year, two distinct periods—linked by a short transitional period—may be observed. If developments were to be depicted in a curve, the graph to be plotted would somewhat resemble a parabola with the origin representing the turn of the tide toward the end of May.

The opening of the year found the industry in a fairly satisfactory position, as mills were on the whole still well employed on old contracts. Warehouses and producers' yards were amply stocked, prompt and quick delivery could be effected and supplies of raw material—with the possible exception of coke—were plentiful.

Official Maximum Prices Became a Farce

New business, however, left much to be desired, since consumers, in anticipation of a reduction of official prices by March, adopted a rather conservative attitude. Contrary to general assumption, the foreshadowed cut in prices in March was deferred for an indefinite period. If free market prices had fairly stabilized on the level of official maximum prices at the beginning of the year, the approaching London conference and the growing political and economic uncertainty were introducing an element of insecurity into the market. This situation became even more pronounced when the failure of the conference was realized and the sanctions of the Allies came into force. The pick-up character of business assumed decidedly grave aspects and prices began to give way. Supply and demand were once again ruling the situation and the operation of official maximum prices became a consummate farce.

The bottom point of the downward curve was reached toward the middle of May. The trend of prices in some of the principal departments is shown in the appended table, in marks per metric ton.

	Jan	Feb	March	April	May	Last Official Maximum
	—Beginning of—					
Ingot	1,850	1,800	1,750	1,750	1,400	1,370
Billet		1,950	1,950	1,900	1,600	1,995
Bar iron	2,515	2,350	2,350	2,300	1,800	2,440
Sheets	3,125	3,000	2,700	2,500	2,100	3,090

Plates, light	3,560	3,500	3,000	2,850	2,350	3,500
Wire rods		2,800	2,500	2,300	1,700	2,720

Revival of Activity Late in May

Though prices for some commodities receded still further during the latter half of May and even during June, a slight but none the less noticeable reaction set in toward the end of May—less reflected in a hardening of quotations than by a more active demand, especially on the part of merchants who were replenishing stocks. Furthermore, the effects of freedom from control made themselves felt at last and in conjunction with the miners' dispute in the United Kingdom and the acceptance of the ultimatum resulted in a certain consolidation of the market.

It is true that the political riots and disturbances in Upper Silesia affected the output capacity of the Silesian industry to a notable extent; so far as operations could be maintained, stocks had to be piled up at the yards because of the interrupted and disorganized transportation service. It should be borne in mind, however, that after all it is the Rhenish-Westphalian district where the center of gravity of the German iron industry rests and it is only natural that the latter profited by the elimination of the Upper Silesian factor during that period.

The upward tendency of prices received a strong impetus through the rapid deterioration of the German exchange toward the end of August and the further depreciation of the mark during the following weeks proved the general signal for an extraordinary rush for material. Available stocks were snatched up in no time, prices advanced by leaps and bounds and within a short time mills found themselves sold out for the rest of the year. Interested circles were at first inclined to predict a short life for the ensuing boom but developments up to date have proved the contrary so far. At present, mills are sold out for the first quarter and flooded with inquiries and orders for the second quarter of 1922 but are, on the whole, reluctant to enter long-term engagements on account of the uncertain raw material and exchange situation.

Business in Hands of Middlemen

The tremendous pressure of demand naturally brought about most abnormal conditions. Spot stocks have latterly been non-available and fancy prices were paid for prompt and quick delivery. As mills closed their books as far back as October and November, present business is almost exclusively handled by the second and third hand. The unparalleled soaring of prices is being viewed with much apprehension in responsible quarters, but no serious effort has so far been made to stem the upward trend.

Labor in insisting upon the reintroduction of official maximum prices takes a rather isolated stand, and when met with a counter proposal by producers and the trade suggesting the drafting of a guiding price schedule, declined to be party to any such scheme. The guiding prices fixed by the steel federation in October and subsequently readjusted in November merely represent a voluntary agreement between producers and consumers and as such do not possess legal character.

The subjoined table shows the trend of prices, in marks per metric ton, during the second period. The figures for the last two months must be considered largely nominal, as they almost exclusively represent jobbers' quotations.

Prices of Steel in Marks per Metric Ton

	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
	—Beginning of—						
Billets	1,420	1,300	1,600	1,900	2,350	3,600	4,800
Bar iron	1,800	1,800	2,650	2,700	3,250	4,200	6,600
Sheets, heavy	1,850	1,750	1,900	2,200	2,700	4,100	6,200
Sheets, medium	1,900	1,800	1,950	2,500	3,100	4,600	7,400
Plates, light	2,000	1,850	2,300	3,100	3,900	5,300	14,000
Wire rods	1,700	2,000	2,050	2,700	3,000	4,650	7,300

Compared with the impetuous upward trend in the finished iron and steel market, pig iron increases were lagging behind all the time except in the last two months. Following upon the recent increase, prices have just again been raised by an average of 1000 marks per ton, the new prices being shown in the table below:

Prices of Pig Iron in Marks per Metric Ton

	Pre-war	Jan., 1919	Jan., 1920	May, 1921	July, 1921	Nov., 1921	Dec., 1921
	—Beginning of—						
Hematite	79.50	314.50	1,718.50	1,816	1,816	2,700	3,891
Foundry, No. 1	75.50	250.00	1,354.50	1,560	1,560	2,200	3,326
Foundry, No. 2	70.50	248.00	1,323.50	1,484	1,484	2,124	3,250
Steel-making	79.00	240.00	977.00	1,535	1,485	1,930	...
Spiegelisen	85.00	240.00	1,017.00	1,708	1,733	2,021	...

Prices for the last two grades have not been announced pending the readjustment of Siegerland ironstone prices.

After a period of suspension covering several years, German import and export statistics have made their reappearance while production statistics for 1920 and 1921 have not been published as yet. Unfortunately, the appended statistics in metric tons are not complete as the Bureau of Statistics has deferred the publishing

of the returns of the first four months in order to accelerate the issuance of the returns of the later months. For the sake of comparison, the returns for the entire year 1920 are given.

Where German Exports Went

As in 1920, Holland will probably figure as the principal export market during 1921 with 190,431 tons out of a total of 935,319 tons exported iron and steel commodities, equal to about 20 per cent. These figures refer, of course, to the period of May-September, 1921, only. The final result will probably show a noteworthy increase of tonnage shipped to the Far East but it seems rather doubtful whether any country will wrest the first place from Holland. Striking features of the returns are the heavy export of pig iron to the United Kingdom and rails and track supplies to Northern Russia during the July-September period. Broadly speaking, the largest shipments in all departments were made during August while the September figures show a slight falling off.

A detailed study of the returns shows the Saar district as the largest importer of pig iron with 21,578 tons, equal to 27 per cent of the total. The United Kingdom imported 3640 tons in August and 8360 tons in September, being the best customer in the last month. These figures are the more surprising in that shipments during former months were nil or at least insignificant.

Regarding bar iron, beams, girders, etc., Holland heads the list with 50,834 tons, or 26 per cent of the total, followed by Austria with 21,124 tons. The principal buyer of rails and track supplies was northern Russia which imported 52,354 tons (36 per cent of the total) during the July-September period, shipments in former months again being nil or insignificant. Other

ample confirmation in the company reports published in the course of the last year. Though 1920-1921 was a less satisfactory year in regard to employment and sales, yet it is astounding to note that profits have rather increased than diminished. Profits and dividends of some of the principal works were as follows, figures in brackets denoting last year's returns: Phoenix 108,285,000 marks (47,687,500) and 25 (20) per cent. Gelsenkirchner Gusstahl, 12,297,000 m. (4,950,600) and 16 (10) per cent. Mannesmann Tube Co., 77,354,500 m. (46,616,600) and 30 (20) per cent. Gutschhoffnungshütte, 60,106,000 (40,550,000) m. and 24 (16) per cent. Rheinische Stahlwerke, 19,786,600 m. (14,087,200) and 20 (20) per cent. A. E. G., 81,581,000 m. (44,675,000) and 16 (14) per cent.

Stress must be laid upon the fact, however, that mere dividend figures have ceased to be a criterion as the bulk of the profits are concealed in special reserve and sinking funds ultimately to be invested in real values, thereby evading the heavy taxation. "No piling up of paper marks"—this was the slogan of the industry throughout the year, and the reconstruction work, erection of new mills and factories, replacement of obsolete and wornout machinery by new equipment, etc., noticeable everywhere, bear testimony to its practical application. There can be little doubt that the relatively favorable financial returns of the past business year may primarily be attributed to the steadily proceeding integration and consolidation of the industry which made for the elimination of waste in every form and shape, coupled with an intensified scientific research and strenuous efforts at lowering of production costs.

Outlook Seldom So Uncertain as Now

Never has the outlook for the industry been so uncertain as at present. This may sound paradoxical in

Five Months' German Exports and Imports

	Imports—		Exports—	
	1920	May to September, 1921	1920	May to September, 1921
Pig iron, including scrap, old material, ferroaluminum, chrome, nickel, manganese, silicon and other non-malleable iron alloys.....	206,064	75,151	152,922	77,792
Piping and pipe shapes, made of non-malleable iron, rough and machined..	11,929	5,937	22,830	14,261
Rolls, made of non-malleable iron.....	293	51	9,154	6,552
Machine parts, rough and machined, made of non-malleable iron.....	2,372	414	7,120	3,779
Other iron ware, rough and machined, made of non-malleable iron.....	3,793	1,552	67,500	24,174
Ingot, blooms slabs billets, sheet bars, rough rails, crucible steel in blooms	31,093	41,941	20,186	17,529
Bar iron, beams, girders, joists, hoop iron, structural shapes.....	78,460	107,093	460,278	192,267
Sheets and plates, rough, pickled, straightened, dressed, varnished.....	16,537	11,156	232,111	82,292
Sheets and plates, lacquered, polished, etc., tin plate; galvanized sheets; corrugated sheets; checkered plates, etc.....	3,627	4,138	15,770	12,556
Wire, rolled and drawn.....	11,014	12,131	83,908	73,313
Tubing and tube shapes, rolled and drawn; coiled tubes.....	2,221	1,547	84,021	43,299
Nails, ties, fishplates, washers.....	16,128	24,898	152,016	144,017
Wrought iron ware, rough and machined, including machine parts, drop forgings, buckets, lamps, containers, etc.....	5,470	1,946	127,867	43,565
Total of iron and steel products.....	119,406	322,521	1,750,601	935,319
Value in 1,000 marks.....		651,053	13,471,268	5,416,633

notable customers were Holland with 21,755 tons, Sweden with 17,719 tons, and southeastern Asia (British-India, Malacca, Ceylon, and the French, Dutch and Portuguese Indies, and the Philippines and Siam) with 16,050 tons.

Holland also lead in the sheet and plate market, her imports amounting to 25 per cent of the total German shipments; namely, 24,274 tons. Austria is second with 9347 tons. Other principal buyers, especially during the latter months, were the United Kingdom and southeastern Asia with 7837 tons and 5734 tons, respectively.

In the wire export market, the Far East and South America took a prominent place, while other noteworthy customers were the United Kingdom and Belgium. Eastern Asia (China, Japan, Hongkong, Korea) ranks foremost with 15,663 tons equal to about 20 per cent of the total, followed by Belgium with 11,707 tons, United Kingdom with 7863 tons, and South America with 7312 tons. The chief buyers of wire nails were eastern Asia and southeastern Asia with 8313 tons and 5090 tons, respectively, out of a total of 28,000 tons exported.

Financial Successes for Steel Makers

That the 1919-1920 year was a brilliant one in every respect was but feebly denied by the industry and found

face of the period of prosperity the industry is just experiencing but is nevertheless true. The present boom is largely built up on the enormously depreciated mark and voices are already heard according to which the peak of the upward curve has now been reached. The notable appreciation of the mark during the past weeks has already had a sobering effect upon the tone of the market and the fact that recent developments at the Washington conference have caused a cancelling of steel orders placed by Japanese customers with the German industry is much commented upon.

Speculative Motives Dictate Glut of Orders

The glut of orders which has lately broken in upon the industry is largely dictated by speculative motives and the experience of 1920 when buyers cancelled orders left and right owing to the appreciation of the German currency, is still fresh in the memories of producers. History may repeat itself and there is no reason to assume that customers will be any more scrupulous than in the spring of 1920. Moreover, the separation of Upper Silesia constitutes a problem the importance of which should not be underrated. About 70 per cent of the steel and 67 per cent of the pig iron production in that province will go to Poland—not to mention the losses in coal and zinc.

Quiet Year in Ferroalloys and Their Ores

A Review of Technical Developments and of Market Conditions—Increase in Number and Uses of Alloys with Steel

BY ROBERT J. ANDERSON

NINETEEN twenty-one was a year of great dullness in the metallurgical ferroalloy and ore industries and, as is usually the case during inactive times, prices showed much irregularity and a marked downward tendency. With steel ingot output at much less than one-half of actual capacity during the past year—and at times as low as 20 per cent—and with the widespread depression in the metal industries as a whole, it is not surprising to find the utmost stagnation in metallurgical ores and steel making alloys. While the power capacity of the electric ferroalloy plants in the United States has increased from 20,000 to 200,000 kva. in the past ten years, probably only about 20 per cent of the plants were operating in 1921.

The automotive consumption of steel has been stressed too strongly in the past. Roughly this is only about 3.5 per cent of the steel ingot production and 6.8 per cent of the alloy steel output. Of course, there is a large quantity of high speed steel normally used in machining operations, and any slump in the automotive industry is felt adversely in the ferroalloy trade. The general condition of the automotive industry is bad and the outlook is poor, and a revival is not likely for some time.

During the late war, in many countries new sources of metallurgical ores were developed, and new electric furnace alloy makers entered the field. Both these influences are likely to prove largely permanent, but it will be a long time before another boom in so-called war minerals is seen. The proposed scrapping of battleships and the ten-year naval holiday may be a bullish argument for general business but these proposals, if effected, will be adverse factors to the ferroalloy and special steel trades.

Metallurgical Progress

Technical developments are normally expected in dull business times, and while no startling changes occurred in practice last year, still alloy makers were engaged in the usual routine development work, and mine operators put their properties and mills in condition for better days expected to come. As is known, the character of the steel casting output of the country is changing; more alloy-steel castings are being made yearly, and the electric alloy-steel output is growing. These changes portend greater consumption of ferroalloys and special steel making metals in future years. Recent developments indicate the growing importance of alloy cast iron for industrial use, and alloy cast iron received considerable attention in the past year, i. e., the manufacture of direct alloy pig iron and also the use of alloy cast iron in foundry practice. Further work has been done on the investigation of substitute deoxidizers by Cain; this was started during the war under the auspices of the National Research Council.

More attention has been paid to the preparation of low carbon ferroalloys by the refining of high carbon ones, and a number of interesting patents purporting to be suitable for this have been taken out in the past year. A new development in this direction is the production of various grades of low carbon ferromanganese by refining the high carbon alloy in the electric furnace. This is being done commercially in France and the alloys are now available in the American markets. Sili-

conthermy was the subject of increased interest and experiment in 1921, and evidently the silicon reduction of ores will be more fully investigated and applied commercially. Much attention was given also to high chromium alloys of iron for oxidation and heat resisting uses. The use of alloy steel for bridges has received further attention in Germany, and it is not improbable that alloy steel bridges will be important in the future.

Ferromanganese and Related Alloys

Manganese mining was naturally at a low ebb in the United States in 1921 and the output was at pre-war levels. Imports of manganese ore in 1921 (principally from Brazil and British India) were about 400,000 gross tons* as against 601,437 tons in 1920, and 333,344 tons in 1919. Southern manganese operators were active in regard to consolidation of properties and planning for more efficient operation of the mines, but little ore was produced. Manganese mining in the Batesville district (Arkansas) has been practically suspended, as was the case in Montana. An outstanding occurrence was the purchase of the Morro da Mina manganese property in the State of Minas Geraes, Brazil, by the United States Steel Corporation. This move makes the corporation independent in respect to manganese ore.

The monopoly of exporting manganese ores from the Republic of Georgia (Caucasus) has been given to the Société d'Exportation de Manganèse de Tchiatouri. Report has been made on the deposits of Horseshoe Range, Peak Hill Goldfield, Western Australia. These deposits have not been worked so far, but it is estimated that 1,250,000 tons of ore of marketable grade could be secured from the top crust. Foreign ore opened the year at 40 to 45 per unit, c.i.f. Atlantic ports, went as low as 20c, and closed at 22c to 23c. There was a sagging tendencing all year, and prices were less than half those in 1920.

OUTPUT AND MARKET

The domestic output of ferromanganese in 1921 may be taken as about 93,000 gross tons, as against 282,681 tons in 1920 and 179,029 tons in 1919. The spiegeleisen production in 1921 was about 67,000 tons as against 103,448 tons in 1920 and 65,391 tons in 1919. The imports of ferromanganese in 1921 were about 9000 tons, as against 59,254 tons in 1920, and 33,022 tons in 1919. Exports were about 800 tons in 1921, as compared with 3454 tons in 1920, and 2999 tons in 1919. The production and movement of both ferromanganese and spiegeleisen have been the lowest in history. No spiegeleisen has been made since last July.

Prices for ferromanganese were exceedingly low in 1921 as compared with 1920, and much foreign and resale alloy was available. With open-hearth steel operations, particularly among the independent steel companies, at the lowest point in years, consumption was much restricted and most melters had ample supplies. Domestic 70 to 80 per cent ferromanganese was quoted at \$120 to \$125 per ton in January, and declined gradually to \$60 to \$63 at the close. English alloy correspondingly sold at \$130 to \$135 down to \$60 to \$63, c.i.f. At-

*Figures for production, imports and exports of ores and alloys in 1921 are estimates in all cases, since they are based on figures reported for only part of the year.

lantic seaboard. Spiegeleisen opened at \$60 to \$65 per ton for 18 to 22 per cent alloy and showed a downward tendency all year, dropping to \$25 to \$27, but strengthening at the close to \$30 to \$32.

NEW LOW CARBON ALLOYS

In connection with the development of low carbon alloys, it is of interest to direct attention to some new grades of manganese and ferromanganese produced by French makers. One contains 75 to 80 per cent Mn, 0.10 per cent maximum C, 1.5 per cent maximum Si, and 25 to 20 per cent Fe. Another contains 95 to 97 per cent Mn, 0.10 per cent maximum C, 2 per cent maximum Si, and 1.5 per cent maximum Fe.

The Kyva Ferromanganese Corporation resumed making ferromanganese and spiegeleisen in the 10-ton electric furnace at Cleveland, Tenn.

METALLURGICAL PROGRESS

In the metallurgy of ferromanganese, the greatest single advance as regards electric furnace practice has been in the use of the Söderberg continuous electrode, introduced in the United States two years ago by the late J. W. Richards. In smelting oxide ore in the electric furnace it has been found that better recoveries are obtained when any necessary iron is added in the form of manganiferous iron ore rather than as steel turnings. It is likely that with the same grade of ore the electric furnace would show at least 5 per cent greater recovery than the blast furnace, and considerable reduction of cost is possible by the use of the Söderberg electrode.

A method for preparing low-carbon ferromanganese is described in a recent patent (Canadian patent 209,740, March 22, 1921). Thaler has discussed the production of pig iron containing manganese from manganiferous blast furnace slags and other residues in the electric furnace, while Stöckmann has described the production of silicospiegel in the blast furnace. The equilibrium diagram of the carbon-manganese alloys has received further attention at the hands of Kido.

Electric and Bessemer Ferrosilicon.

Developments in ferrosilicon in 1921 were unfavorable, and several makers of 50 per cent alloy went out of business in the first few months of the year. With steel production low, and manufacturers of automobile castings out of the market, there was little demand for Bessemer grades and silvery iron. Imports of all grades of ferrosilicon were about 6300 gross tons in 1921 as compared with 13,609 tons in 1920 and 10,445 tons in 1919. Exports were about 380 tons as against 632 tons in 1920. Prices for all grades were lower than in 1920, and some extremely low prices were named by makers of electric ferrosilicon of the lower grades—the differential between these and the blast furnace product being about \$14 at one time. Bessemer ferrosilicons—9, 10, 11, and 12 per cent, grades—sold at \$61, \$64.50, \$67.80 and \$71.10, respectively, until the latter part of March, then dropped substantially, and had a downward tendency most of the year. At the close, the 10, 11, 12, 13 and 14 per cent grades were quoted at \$38.50, \$41.80, \$45.10, \$49.10 and \$54.10, respectively, Jackson and New Straitsville, Ohio. Domestic 12 to 15 per cent electric furnace alloy sold at \$55 to \$60 at the opening and closed at \$38 to \$40 per gross ton, f.o.b. works. The 50 per cent grade opened at \$75 to \$80 and declined to \$57 to \$60, furnace, freight allowed, while the 75 per cent alloy opened at \$150 and declined to \$120 to \$125. Foreign and resale alloys were plentiful.

METALLURGICAL DEVELOPMENTS

Siliconthermy received more attention than in some years. Terrisse and Levy (British patent 151,974, Aug. 3, 1920) have patented the addition of tungsten and vanadium to acid-proof iron-silicon alloys for the purpose of improving the mechanical properties. Becket (United States patent 1,386,227) has a process for re-

fining crude electric furnace silicon, based on the selective action of hydrofluoric acid on the iron contained as an impurity. Piowarsky has examined exhaustively the effect of the time of adding silicon on the physical properties and gas content of open-hearth steel and recommends adding ferrosilicon as late as possible. Lowzon has examined the constitution of the iron-silicon system and published a complete diagram. In passing, it may be pointed out that there is a latent demand for very pure silicon for use in the manufacture of light aluminum-silicon alloys.

Ferrochromium and Stainless Steel.

The depression in the United States in mining chromite, which started at the close of the war, continued through 1921 and the industry is decidedly flat. However, pre-war conditions in chromite are being restored, with Rhodesia and New Caledonia as the leading producers. Expansion of mining operations in the Macri district, Asiatic Turkey, is planned to the extent of a production of 100,000 tons annually. The three largest mines are American owned. Chromite mining in Bosnia and Serbia will be resumed by the Jugo-Slovakian Government. The deposits of the Umwecke Hills, Rhodesia, have been examined and reported upon by the Rhodesian Geological Survey.

California concentrates, 50 per minimum, opened at 55c. to 60c. per unit and declined to 45c. to 55c. in June. Thereafter, 40 to 45 per cent foreign ore brought \$20 to \$25 per net ton, Atlantic ports. Prices for the various grades of domestic ferrochromium declined steadily all year from 16c. to 17c. per lb. of contained Cr for the 6 to 8 per cent C grade to 11c. and from 17c. to 18c. for the 4 to 6 per cent C grade to 11c. to 12c.

PATENTS OF THE YEAR

Several patents have been taken out for the preparation of low carbon ferrochromium. These include British patents 145,709 and 145,711, June 26, 1920; 152,990, Jan. 12, 1921; and 148,456, July 10, 1921; and United States patent 1,365,901. In one case low carbon ferrochromium is made by the interaction of the high carbon alloy, chrome ore and oxides which readily yield oxygen, in the electric furnace.

Walter (British patents 156,561 and 157,054, May 4, 1920) suggests ferrochromium-silicon alloys and a method for their manufacture. Low carbon ferrochromium is essential in the manufacture of stainless steel. Both stainless steel and stainless iron, so-called, received a great deal of attention in the past year. The production of a steel possessing acid-, heat-, and oxidation-resisting properties obviously has a great future, and apparently only the fringe of possibilities in these materials has been touched. Stainless iron (in fact a very low carbon stainless steel) has been put upon the market by three British firms. Various high chromium alloys for oxidation-resisting and other purposes have been patented recently (Canadian patents 206,785, Dec. 21, 1920, and 207,477, Jan. 11, 1921; United States patents 1,365,091, 1,375,081, 1,375,672, and 1,375,673.) Fahrenwald has suggested iron-chromium alloys for non-corrodible gun barrels, and there may be possibilities in this direction, at least for small arms. The number of such arms that become useless each year because of rusting or pitting is enormous.

Ferrotungsten.

Tungsten mining in the United States is now dormant, owing to the low prices for foreign ores and the general quietness in the ferroalloy industry. Consumption of tungsten in 1921 was very small because of the general inactivity and the slack demand for most metal products. Domestic scheelite sold at \$4 to \$4.50 for 60 per cent WO₃, f.o.b. mines, in January last, and the price gradually declined to \$3. Foreign wolframite

brought \$3 to \$3.50, New York. Chinese ore was offered at \$2.50. Some of the tin-tungsten mines in foreign countries were shut down on tungsten but operated on tin; for example the Kaubauk Burma Wolfram Mines, Ltd.

Hess has described the unique tungsten deposits near Oruro, Bolivia, while Brown has similarly dealt with the deposits of Burma. Bowater has described the dressing of tungsten ores at the Burma Queensland Corporation, Wolfram Camp, North Queensland. Blanch (German patent 330,987, March 28, 1920) has patented a process for treating tungsten ores, consisting briefly of decomposing with an alkali chloride, roasting and treating with sulphuric acid.

Prices of ferrotungsten and tungsten powder have been steadily on the down grade. The 70 to 80 per cent alloy sold at 55c to 60c at the beginning of the year, and closed at 40c to 45c per lb. of contained W. Prices were less than half those in 1920. Foreign alloy was offered freely. Head (Canadian patent 208,990, March 1, 1921) suggests the preparation of tungsten by heating a mixture of sodium tungstate, ammonium chloride and charcoal at 1000 to 1150 deg. C. Lohman (British patent 157,780 Jan. 10, 1921) patents a process for the removal of carbon from tungsten by heating it at approximately the melting point in an atmosphere of hydrogen. Alexander (British patent 155,739, April 6, 1920) patents the use of tungsten tablets for adding tungsten to steel. In recent years ferrosilicon (85 per cent Si) has been used considerably in England instead of aluminum powder for the reduction of tungsten and ferrotungsten.

Ferrovandium

Ferrovandium was in better supply in 1921 than in 1920, and although there was a slight scarcity at times the demand was less. The Vandium Corporation of America is planning an installation for the treatment of the mine waters at Minasragra that carry an appreciable quantity of vandium heret fore lost in Lake Punrun. The recovery from this source, it is estimated, will be \$500,000 yearly. Research looking to the recovery of vandium oxide from western phosphates, and from coal, hydrocarbon shales and natural asphalts has been suggested as a proper activity for the Government. Vandium occurs in the ashes of some domestic coals to the amount of 38 per cent. The vandium-bearing asphaltites have come in for further interest. There are a number of deposits of such asphalts in the world, and it is possible that they may become sources of vandium. A large area in the provinces of Pasco, Yauli, and Jauja, Peru, contains a series of deposits that give an average of 1 per cent, V_2O_5 , and the ashes of which give an average content of 50 per cent. The old Chichi silver mine at Culiacan, Mexico, has been found to contain considerable vandium in the form of lead vanadate.

The Course of Prices

Vandium ore, minimum 18 per cent V_2O_5 , sold at \$1 to \$1.50 per lb. of contained V_2O_5 , while carnotite containing 1.5 per cent U_3O_8 and 5 per cent V_2O_5 brought \$1.50 and 75c. per lb. for the respective oxides, the ore containing 2 per cent U_3O_8 and 5 per cent V_2O_5 , sold at \$2.25 and Mackay (British patent 157,555, Oct. 18, 1919) and Copelin (United States patent 1,381,802) have brought out processes for the treatment of vandium ores.

Ferrovandium, 30-40 per cent V, sold at \$5.75-\$6.75 per pound of contained V, with differentials depending upon the silicon content, during the first part of the year, but the price fell to \$4.25 to \$4.50. Cadenhead and Goodwin (Canadian patent 208,623, Feb. 15, 1921) have patented a process for treating vanadiferous iron ore in which the ore is furnace with a reducing agent and a suitable flux to produce a pig iron having a maximum quantity of vandium therein. In the suit

of the Bethlehem Steel Co. vs. the Churchward International Steel Co., the Churchward patents relating to vandium steels were held void for want of invention.

Ferromolybdenum

Molybdenum had another quiet year in 1921 but structural molybdenum steels are being taken up more and more, and the properties and possibilities of these steels are gradually being better understood. The flotation method has been adapted to treat the majority of molybdenum ores and will probably be the principal one used in the future. The Elnore oil process has been used almost exclusively in Norway, but has not found favor elsewhere. Deep molybdenum ores, containing 50 per cent Mo, have been found in New Mexico in the past year. In Canada, the molybdenum industry at Quyon, Que., is now quite dead. Molybdenite, 85 per cent MoS_2 , was quoted at 55c. to 60c. per lb. of MoS_2 , New York, all year. Forland (Canadian patent 207,832, Jan. 25, 1921) has a process for treating molybdenum sulphide ores with chlorine gas, thereby forming molybdenum chloride which is condensed.

Molybdenum for Structural Steel

In regard to molybdenum steels, it has been pointed out by Mathews that the structural type will not wholly displace any other type of steel but that these steels have established a place among the alloy steels found useful to the aircraft, motor and general engineering trades. The structural molybdenum steels appear to have a wide safe heat treatment range as determined by static tests. Below 1 per cent, molybdenum gives no trouble from volatilization, but volatilization difficulties are bad in high-speed molybdenum steels. In the manufacture of molybdenum structural steels in the open-hearth furnace, the experiments of Schmid indicate that it is best to add ferromolybdenum in the furnace. Mathews finds that ferromolybdenum, molybdenum powder, and calcium molybdate are equally satisfactory for making fixed additions of molybdenum to steel. According to a patent (German patent 337,961, March 3, 1920), briquettes of calcium molybdate are made by mixing molybdenum trioxide and calcium chloride with water, pressing the mix into shapes and drying. The use of molybdenum, with or without copper, in iron for the production of rust-resisting alloys is patented by Charls (United States patents 1,363,564, 1,355,589, and 1,355,590). Ferromolybdenum sold at \$2 to \$2.50 per lb. of contained Mo in 1921.

Ferrotitanium, Ferrouanium and Ferrozirconium

The year was a quiet one in ferrotitanium, ferrouanium, and ferrozirconium. Further experiments have been made in smelting the titaniferous iron ores of Canada, while Heskett has given a résumé of experiments carried out by the New Zealand Iron Ore Smelting & Mfg. Co. on titaniferous magnetite (9 per cent. TiO_2). Sicard (United States patents 1,374,035 and 1,374,036) has patented processes for producing low-carbon ferrotitanium by smelting a high-carbon alloy with an excess of titanium oxide. The prices for ilmenite and rutile were practically stationary last year. Ilmenite, 52 per cent, TiO_2 , sold at 1.25 to 1.50c. per lb. while 95 per cent rutile brought 15c. Ferrocarnotitanium, 15 to 18 per cent, was quoted at \$200 to \$225 per ton, f.o.b. Niagara Falls, N. Y.

The carnotite ore of Colorado supplies the domestic raw material for the manufacture of ferrouanium as in previous years. Polushkin, in the Carnegie Scholarship memoirs of the Iron and Steel Institute, has discussed the alloys of iron and uranium, and has made microscopic examination and tensile tests of uranium steel. The recovery of uranium is best when ferrouanium is added to the ladle in making steel. Uranium oxide, 96 per cent, brought \$2.25 to \$3 per lb. in 1921.

Quotations for carnotite have been given above under ferrovanadium. Ferrouanium, 35 to 40 per cent., sold at \$6 to \$7 per lb. of contained U.

The Bureau of Mines, by the issue of its Bulletin 186, has made available much data on the occurrence, properties and preparation of zirconium, and this publication should be of much value to alloy makers. Recently as much as 3 per cent of some of the auriferous sands of Idaho has been found to consist of zircon mixed with monazite. Schoeller has discussed the removal of titanium and other impurities from zirconia by the process based on the preparation of crystallized zirconium oxychloride. North and Loosli British patent 155,299, Dec. 15, 1920) have patented a process for reducing zirconium oxide by mixing it with the theoretical amount of carbon and heating under increased pressure in an electric furnace. Sicard (United States patent 1,374,037) has patented a process for the preparation of low-carbon ferrozirconium by decarburizing a high-carbon alloy with titanium oxide, and a process (United States patent 1,374,038) for the manufacture of zirconium steel by treating steel with a zirconium-silicon alloy. In 1921, zircon sold for 3c to 5c per lb.

Minor and Complex Ferroalloy

Much experimental work carried out recently on minor and complex ferroalloys has been reported in the patent literature. Ferroaluminum and complex ferroaluminums, e.g., ferrosilicon-aluminum, are receiving further attention, and the direct manufacture of the latter in the electric furnace from iron-bearing aluminum silicates is a commercial possibility. Penniman and White (United States patent 1,369,298) suggest ferrosilicon-aluminum, made by reducing compounds of aluminum, silicon and iron, such as feldspar, in an

electric furnace with iron and carbon. Hadden (British patent 165,166, March 17, 1920) has patented an aluminum-uranium-magnesium alloy for deoxidizing steel, while Vos (Canadian patent 206,713, Dec. 21, 1920; British patent 162,917, May 5, 1920, and United States patent 1,382,147) has patented an aluminum-rich aluminum-magnesium alloy for the same purpose. Calcium silicide is now being manufactured in fairly large quantities in France for use as a steel deoxidizer, and it is growing rapidly in favor in connection with electric-furnace steel making practice. Pistor *et al.* (United States patent 1,376,113) patented a ferrosilicon-magnesium alloy for use as a deoxidizer.

The use of 4 to 5 per cent nickel in high silicon cast iron for electrical resistance grids is reported, and Bauer and Piowarsky have examined the effects of cobalt and nickel on cast iron. It appears that a content of 1 per cent nickel is desirable but that cobalt has deleterious effects. Some tests have been made at Sheffield, Eng., of one of the nickel-base (Ni-Si-Al-W-Mo-Zr) alloys, known as cooperite, for cutting tools. The Australian nickel firm, Ballande & Son, is proceeding with its proposals for the installation of electric furnaces for the manufacture of ferronickel.

Many complex alloys for various purposes have been patented recently but these need not be reviewed here. It has been suggested that niobium be used in steel alloys, alone or with other metals, e.g., tungsten or tantalum, and alloys prepared from electrolytic carbon-free iron and containing 3 to 10 per cent Cu for resisting corrosion are also suggested.

The publication last year of the methods of the chemists of the United States Steel Corporation for the sampling and analysis of ferroalloys is of general interest.

Prices of Iron and Steel and Other Products

Analysis of Basic Facts Shows Steel Lower Than All Other Commodities Save Those from the Farm and Certain Other Metals

BECAUSE of persistent mis-statements of financial and other writers finding their way into print, THE IRON AGE published last September a diagram showing how the composite price of finished steel compared with the prices of ten groups of wholesale products, which are quoted month by month by the United States Bureau of Labor Statistics. It was shown by that diagram that, in spite of false repre-

sentations to the contrary, finished steel was lower at that time than any of the Labor Bureau groups with the exception of farm products and of the metals and metal products group, including steel itself. Not only was steel much lower than the others, but it was considerably lower than the average of all. Another thing which that chart showed was that the 1920 peak of finished steel was lower than eight of the ten Labor

Course of Prices of Finished Steel and Pig Iron Since 1904, Based on THE IRON AGE Composites. Pig iron went higher in such boom years as 1906-7 and 1920 than did steel

Bureau groups, the other two being the metals group, which includes steel, and the chemicals and drugs; but it should be noted that the latter group was far higher in September than was steel.

These figures have now been brought down to date and somewhat amplified, so that the two accompany-

with beams, the present price is higher than in 1913, six of the items being still more than double their prices of eight years ago. It will also be noted that, while the price of beams in the fall of 1920 was more than double the 1913 and the present price, yet in the case of every one of the other fifteen products shown, the relative price in 1920 was considerably higher than the price of beams. One of the items was, in 1920, more than seven times its 1913 price; eight others were more than three times the 1913 price, one of these being more than four times.

In all of the items shown in the two diagrams, the 1913 average is the base of the comparison, this being considered as the "100 per cent" price. Above this base is a shaded area, representing the excess of the present price over that of 1913. Above the shaded area, again, is a white area, representing the excess of the 1920 peak price over the present price. From this it follows that the entire height of each bar represents the 1920 price, and the height to the top of the shaded area represents the present price.

It requires only a little study of the facts in the case to show conclusively that iron and steel prices to-day are lower than the prices of most of the other large items entering into the business of the United States. Only when we come into the field of non-ferrous metals, and into the field of farm products, do we find any considerable bulk of material selling lower to-day than finished steel.

The Association of Friends of the Academy of Mining at Freiberg, Saxony (Gesellschaft der Freunde der Bergakademie Freiberg), was founded on Dec. 3, 1921. The aim of this association is, in part, to help the academy in fulfilling its task as regards research work and teaching. The chairman of the association is Dr. K. Sorge, chairman of the Reichsverbandes der deutschen Industrie (Union of German Industries). The association asks alumni to become members.

The General Electric Co., Schenectady, N. Y., has distributed a bonus among employees totaling five per cent of earnings for the past six months, ending Dec. 31, and including all workers in the service of the company for the past five years or more. The last supplementary compensation of this character was made on June 30 last, with aggregate distribution of \$1,067,899 to 24,772 employees.

At the annual meeting of the Manufacturers' Association of Connecticut, held at New Haven, Dec. 29, the following officers were elected for the ensuing year: President, E. Kent Hubbard, Middletown (re-elected); vice-president, John H. Goss, Waterbury; and treasurer, Robert C. Buell, Hartford.

Item	Prices Quoted			Index Number, 1913 = 100	
	Average 1913	Peak 1920	Present Figure	Peak 1920	Present Figure
Farm products				246	114
Food, etc.				287	142

of March 3, 1879

Moving Toward Prosperity

It was said in these columns one year ago that there was hope in the fact that the people of the United States were again on the road to prosperity. Looking back over 1921 one sees very little that appropriately could be linked up with the word prosperity. Yet it is even plainer to-day than it was one year ago that when in 1920 the American people began to realize that for six years they had been traveling away from prosperity, they then had taken the first step on the return road.

The war years had been years of wasteful expenditure by the Government of billions it had borrowed from the people. Then followed two years in which the spending of wealth rather than its production was the controlling purpose. The collapse in 1920 brought home the lesson that war prices, war profits and war wages were an unhealthy combination. Then began the painful process of readjustment, called also deflation. It continued throughout 1921 and promises to go on during 1922.

Apart from the war's destruction of accumulated wealth, its worst economic effect was the belief it left in the minds of many men that a new era had come in which by getting a large wage for less work the worker had reached his best estate. The past year has been showing how great a delusion that was and how the worker has been crippling his own buying power. To the extent to which the delusion has been driven out, the discipline of these months of depression has been wholesome.

One year ago, also, producers and dealers were much given to argument over high prices—argument that either repelled the charge of profiteering, or pointed out how producers or distributors in some other line were guilty of that thing and thus were delaying the return of prosperity. To-day, while the inequalities in the fall of prices and wages are well recognized, there is much serious work upon the problem of so reducing unit cost as to persuade the consumer that he can buy with safety.

The phase of the cycle has been reached in

which money has become cheaper. The beginnings are seen of the next phase, in which cheap money promotes the buying of securities. And next in line is larger buying of cheapened commodities. Thus the events of 1921 have gone far toward demonstrating that while the upheavals of the war have changed many things, they have not abolished the basic laws that have governed the return of prosperity after every other crisis in finance and industry.

On other pages is traced in some detail the process of readjustment in iron and steel—the industry that is fundamental to all the country's manufacturing activities. Economies are coming into play that were impossible with the state of mind of owner and workman what it was in the years of the war and the two years following. In the metal-working industries, of which iron and steel are the raw materials, there is the same disposition to meet the requirements of the new situation by enforcing production economies. In the machine tool branch, in which the year has been especially disastrous, the effort to meet the situation is evidenced by some steps in redesigning and in a few cases by the introduction of lines of manufacture, apart from tools, not followed heretofore.

War effects have been held so largely responsible for all that has happened to industry that too often the tendency has been to drift under the influence of events. Thus fluctuating exchange, the precipitous drop in exports, Germany's default, high freights, tariff uncertainty, excessive taxes, over-capacity and undigested product have been put in high control in many cases, while individual initiative has abdicated. But more recently there have been signs of stirrings that point to renewed activity in many directions in the coming year. Progress may not be rapid and there may be interruptions, but there should be no mistaking the fact that industry is traveling the road that leads to prosperity.

Reports are that a few strong industrial establishments are planning to manufacture for stock. Such companies are fortunate in not having to

carry manufactured product into 1922. They feel that deflation in the raw materials they use has pretty nearly run its course. They are asking, however, for lowest possible prices, with the understanding that the savings effected will be offered to the potential buyer. They expect to approach purchasers who were negotiating in the latter part of 1920, and believe they have a fair chance of making sales, seeing at how much less the given machine or apparatus can now be had than the prices quoted when the collapse of 1920 came. There are plants which need additional or more efficient equipment and they have been postponing against the coming of favorable market conditions. It may be that the makers who are seeking business in the way indicated have actually an optimistic view of early 1922 and intend to be forearmed with low-priced materials and a backlog of orders. The international character of one of the concerns has made an impression on sellers, who consider these attempts to stimulate activity as of more than ordinary importance.

Readjustment in 1921

A year ago readjustment had only begun and it was patent that the readjustment process was necessary in everything. To-day it can be said that in many quarters readjustment is now completed or well advanced. The inventory of the things that have not been readjusted is much shorter than the inventory of those that have.

In steel prices the liquidation has gone far. Steel prices are approximately one-fourth higher than the average prices of 1913, while commodities in general, as shown by the Bureau of Labor's index number of wholesale prices, are approximately one-half higher. Steel prices are indeed only one-half higher than they were at the low point at the end of 1914, a price level which did not enable the Steel Corporation, with all its economies, to earn all its bond interest in the following January. With lower wages, lower freight rates, lower taxes and lower cost of general supplies the steel industry could reduce prices still further; but making allowance for these items steel is selling at the lowest price in the whole history of the industry.

Not so much can be said for the cost of consuming steel or putting it into employment as can be said for the price of steel f.o.b. mill. On an average, the various things that are made of steel cost more, in proportion to their pre-war cost, than does the steel itself. This is largely due to incomplete liquidation in labor cost of fabricating or working steel. In some cases wares made of steel are offered to the buying public at prices that make a favorable comparison with pre-war prices, but in those cases the result has been achieved by improvements and refinements in manufacturing processes.

The three great cases in which there has been a lag in the liquidating process are all cases of wages—wages on the railroads, in the building trades and in coal mining. These, disregarding influences that arise from conditions existing outside the United States, are the three conspicuous

obstacles to resumption of industrial and commercial activity with pre-war vigor and confidence. The low buying power of the farmer is also an obstacle, but that is in another category, namely of over-deflation, in which it stands by itself. The expense in operating railroads that is due to wage rates above the average, and to working conditions that prevent many railroad employees from rendering full service for the wages they receive, is helping to keep freight rates up when there is a practically universal demand that they should come down.

In the building trades there has been some liquidation in wages and working conditions, but not enough. In this line of activity there has been a particularly clear illustration of the principle that some buyers can wait better than others. Construction work can be divided, very roughly, into two classes, that which is imperative and that which can wait. The home builder has been taking hold in 1921, for he has only so many years to live and is willing to bear a loss if necessary to save some of those years. The purely investment builder is not so subject to this influence and has been disposed to wait.

As to the third obstacle, the high cost of producing coal under the United Mine Workers wage scales, the termination of the present agreement on March 31 seems destined to witness a contest of no small size for the purpose of liquidating the cost of producing coal. Events of the past week indicate that the "central competitive field" is going to pieces, which means evidently that the operators will refuse to negotiate such a national agreement as they have had in the past, and instead will offer to negotiate with the miners in the respective districts; also that they will refuse to continue the check-off.

Despite the obstacles remaining, business already has found a basis on which it can expand in a moderate and conservative way. It is already on the road to improvement, and all indications are that the way will become clearer and clearer as the year 1922 grows older.

The Machine Tool Outlook

Among the numerous reviews of the past year and prophecies for 1922, a contribution of special interest and value is that of Frank A. Scott, vice-president of the Warner & Swasey Co., Cleveland, in the *New York Evening Post*. While not attempting to belittle any of the difficulties of the present situation, and while frankly stating that in September, 1920, the American machine tool industry entered upon a period of depression more severe than had ever been known, he gives his reasons for believing that it will reassert itself in the foremost position among machine tool manufacturers of the world.

Mr. Scott speaks of the extraordinary demand for machine tools which followed the armistice, to meet the needs of the automobile and other metal-working industries which were endeavoring to resume their places as producers of peacetime instead of war-time products. But by the fall of 1920 there was full realization of the seri-

ous situation which confronted the industry and "from the pinnacle of its greatest success and prosperity it descended during 1921 to the lowest level, contrasting its present productive power with the existing demand, that has been known since the making of machine tools grew large enough in volume to be called an industry."

As to the older and better established companies, Mr. Scott takes an optimistic view, saying that they have nothing to fear on account of the present discouraging period and are even now confidently predicting the outcome. Their products are well known, their organizations are seasoned and their designs represent the intelligent development of years of experience. He points out that the increased production of pig iron in foreign countries will make necessary much greater use of machine tools in order to finish the iron for use. The older companies will naturally move into the new fields of demand, but Mr. Scott does not speak with confidence of the new companies with trade names unknown, with products designed during the war pressure and unseasoned by years of experience. Many of them must go the way of other short-lived war-time industries. He says that in the new industrial era competition will again be the ruling force. Machine tools of even a few years on the market must give way to those of new design, for machine tools of even five years ago cannot compare with the new machines and the expert application of their possible service worked out by the engineering science of to-day.

In the new designing Mr. Scott believes that this country will take the lead; that it will be again a case of the "survival of the fittest," with the old and experienced manufacturers winning in the battle; that with courage and willingness to rise to the extraordinary demands of the situation success may be attained. It is clear that in the next few years the inventive genius and selling ability of machine tool manufacturers will be put to the test in an entirely unprecedented way.

Efficiency Again in Repute

Granting that most commodity prices are tending downward, it behooves an industrial establishment to limit its financial obligations to as short terms as possible. The products of manufacture some years hence will not bring as much as now, and a greater turnover will consequently be necessary then to meet maturing indebtedness. This is, of course, on the assumption that the average normal percentage of profit is secured. By the same token lending institutions will bargain not merely for good rates but for long rather than short period accommodations, seeing that the dollar paid at maturity will have increased buying power.

History shows that a deflation movement may extend for years after the sharp initial cuts from top prices. Economists believe that the story of events following the violent shaking of the world's commercial structure in 1920 and 1921 will be history repeated. Thus marked or sustained recov-

eries of commodity prices are not expected, and the burden of keeping the products of a plant in a strong competitive position will fall in no small part upon the purchasing department.

Prices obtained for the manufactured article will be sharply competitive as deflation continues. Profits will come more than in recent years from savings in raw material costs. Efficiency must be the watchword, not merely in manufacture, where it has always been appreciated if not practised, but also in selling as well as buying, for no longer can what is saved in the factory, a cent at a time, be thrown away in dollars in selling, a hundred cents at a time. What particularly needs emphasis now is that these times of readjustment must develop equal efficiency in every department of industry, from purchasing through to selling. In proportion as the need of that brand of efficiency gets recognition, we shall see progress toward real and lasting prosperity.

Progress in Electric Metallurgy

Two important developments mark the progress of electric furnace metallurgy in 1921. One is the larger use of the electric process for making manganese steel castings and the other the increased production of iron castings from electrically melted iron.

For years the cupola and the converter have been the melting and refining mediums for manganese steel castings. Recently the largest producer of manganese steel adopted the electric process for its entire operations and one or two new companies have been formed to make manganese steel castings electrically. An article elsewhere discusses exhaustively the metallurgy of electric practice in manganese steel castings and points out the advantages, prominent among which is the recovery of manganese steel scrap with little loss of the manganese.

The movement toward electric gray iron castings has gained momentum. Prominent in the new installations of electric furnaces last year, as recorded in our annual review, are the projects for making various gray iron products electrically. We have discussed already the metallurgy of this process and its advantages. Recognizing its importance, a large technical society will conduct a symposium on electric gray iron at its spring meeting.

In the industry as a whole, healthy progress was made last year in spite of the depression. The increase of about 9 per cent over 1920 in number of furnaces installed or contracted for was beyond expectations. While plain steel products have accounted for part of this growth, gray iron castings and manganese steel have been leading factors.

The fact that in a year of stagnant business such an industry could grow as it has holds good promise for the future. There is widespread interest in the possibilities of the electric furnace for gray iron and there will be further expansion in this field along with the normal growth of the steel phase of electric metallurgy.

MORE TROOPS CALLED

Less Disorder at Newport, Ky., and Hope of Settlement at Early Date

Governor Morrow, of Kentucky, has ordered two additional companies of national guardsmen to Newport, Ky., where they have assumed strike duty at the plant of the Newport Rolling Mill Co. There are 330 soldiers now stationed in Newport and the Governor has let it be known that the entire guard will be called out, if necessary, to maintain order. Since the arrival of the soldiers, much of the lawlessness resorted to has been stamped out, although occasionally employees of the plant are waylaid and beaten at out of the way points.

As a result of a public meeting held on Dec. 27 at the First Baptist Church in Newport, it is possible a solution of the labor difficulties now existing at the Newport Rolling Mill Co.'s plant may be found. This meeting was attended by 2000 citizens of Newport and was addressed by W. N. Andrews, president of the rolling mill company, and E. W. Miller, president of Local No. 5 of the Amalgamated Association of Iron, Steel and Tin Workers. Rev. W. B. Harvey, pastor of the church, made a proposition to both sides as a basis for settlement of their difficulties. The first clause called for recognition of the unions by the company, and other clauses stated that the union shall accept the basic rate of 28c. an hour for common labor, and that no strike shall be called for any reason within less than one month after notification shall have been given to the company that a strike is contemplated. The agreement also provides that two months' grace shall be given at the expiration of any contract between the unions and the company before a strike shall be called or the men cease to work. It is understood that a proposal from the company for the withdrawal from the Amalgamated Association of the unskilled and semi-skilled union workers will be the opening wedge in new negotiations for settlement of the difficulties.

Speaking at the meeting, Mr. Andrews stated that the loss in wages to the employees of the company since the mill closed down on July 1, last, was \$4,775,000. Since January, 1919, the employees of the company had lost 53 weeks work while the company was trying to negotiate wage scales with the Amalgamated Association. Mr. Andrews also said that the company was not opposed to union principles, but found that it could not compete with other plants because of wages and other conditions imposed by the Amalgamated Association.

Mr. Miller had very little to say as to the differences between the company and the men, up to the time the break in the negotiations came. He created a stir when he declared that he believed the troubles at the mill were not caused by members of the union or by the operators, but that members of the I. W. W. were in Newport and were trying to stir up strife.

Coal Operators and Miners Will Confer

PITTSBURGH, Jan. 3.—Declination of the coal operators in southern Ohio and in the Pittsburgh district to accept the recent invitation of the officials of the United Mine Workers of America to meet and discuss a new wage scale and working conditions is not taken here to mean that the operators in either district propose to abandon all agreements with the coal miners' union and to seek to set up the "open shop" principle. On the contrary, when the miners have formulated their ideas and are ready to present them, a meeting will be held as formerly. A meeting of the United Mine Workers of America for the purpose of drawing up a new scale and a set of working conditions was scheduled for last September, but was postponed until Feb. 14, this year. The recent effort to meet with the operators was for the purpose of finding out how the operators felt and to get their ideas prior to the Feb. 14, meeting.

The operators, in declining to enter this preliminary meeting, did so because they see the possibility of a

good many important developments between now and the end of the present agreement on April 1, and since this contract was made with the Government a party, there is a desire to avoid doing anything which might be opposed by the Government. Pittsburgh district operators do not believe that the new agreement should establish common scales and working conditions for central and western Pennsylvania, West Virginia, eastern and southern Ohio and Indiana and Illinois. The other districts do not compete with Illinois and Indiana and furthermore, Pennsylvania and West Virginia operators of union mines do compete with a good many non-union mines. It is probable that the new arrangement will segregate into districts what is now included in the central competitive district. It is too soon to state definitely whether the check-off system will be eliminated, but it can be said that there is a strong sentiment among operators in favor of its elimination.

Increased Use of Creosoted Wood Block Floors

The use of treated wood block floors in 1920 showed an increase of over 80 per cent over the 1919 figures, according to the Service Bureau of the American Wood Preservers' Association. Creosote oil and a creosote coal-tar paving oil were used as preservatives, with an average absorption of approximately 9 lb. per cu. ft. Incomplete statistics for 1921 show an increase over the 1920 figures and a tendency toward the absorption of a little less oil per cubic foot for interior floors. The desire for a permanent, resilient floor with high wearing qualities is given as the reason for the increased demand for floors of this type for factories, machine shops, foundries, warehouses and mills of various kinds.

Buys Wainwright Corporation

ST. LOUIS, Jan. 3.—The McQuay-Norris Mfg. Co., manufacturer of piston rings, has acquired the plant and business of the Wainwright Engineering Corporation, Connorsville, Ind., manufacturer of pistons and piston pins. W. K. Norris, president of the former company, announces that the acquisition is preliminary to the entry of his company into the piston and pin business at Connorsville, under the name, the McQuay-Norris Mfg. Co. of Indiana. Sales will be handled by the St. Louis company.

The General Electric Co., Lynn, Mass., is to ask all persons connected with the plant to contribute 1 per cent of their earnings, weekly, to provide a fund to relieve former and present employees from suffering and want during the winter. A relief committee of employees and officers has been formed and plant additions, repairs and yard work will be started at once to provide employment for those out of work.

The American Steel & Wire Co., Worcester, Mass., in the interest of economy, has suspended the publication of its monthly shop paper, the *Bulletin*, which contained news of interest to the 5000 employees of the three Worcester works.

THE IRON AGE AND ITS READERS

A unique contribution to the columns of THE IRON AGE appears on pages 20 and 21 of this Annual Review Number. Henry David Hubbard, the author, is secretary of the Bureau of Standards at Washington, and since 1901 has been in charge of the publications of the bureau as compiling editor. He is also the writer of the annual review of physics for the International Year Book.

In presenting his Soliloquy of Steel Mr. Hubbard has been aided by his talent as an illustrator, and most effectively we believe our readers will agree.

Railroad Buying for 1922 Undetermined

Presidents of Roads Say That Much Will Depend on Recovery in Traffic and Earnings and on Reductions in Wages

IN response to inquiries from *THE IRON AGE*, presidents of some of the leading railroads of the United States have indicated in statements published below what their policies are to be regarding purchases of rolling stock, shop equipment, construction of bridges, stations, shops, etc., during the coming year. With many of the roads plans are still in an undetermined stage. The extent of purchases will depend largely on recovery

in traffic, which fell off in December; ability to make sufficient earnings to put into improvements, and likewise their success in reducing the high wage rates with which they were saddled under Federal control. Some of the roads which are in good financial condition have already engaged upon betterments which will come out of their 1922 budgets, but a majority of those replying have only indefinite plans in mind at this time.

By Ralph Budd

President Great Northern

Except for material absolutely necessary to maintain the railroad properties, I feel that the orders placed for iron and steel products depend very largely upon the showing of earnings made by the railroad companies. While October, 1921, was a fairly good month, November was not so good and December will show a still greater decline. This, to a large extent, is because the October earnings reflect an early movement of agricultural products.

If you will permit me to express the opinion, I would say that I think it a very doubtful policy for the heads of some of the furnace companies to pursue the course of attacking ore rates in the hearing now taking place at Chicago, by making the argument that whether the railroads can afford to reduce rates or not, they should do so to stimulate steel business. If, as you say, the prosperity of the iron and steel companies will depend to a large extent on railroad orders for 1922, I should say the iron and steel business is not being helped any by attempting to reduce rates, which will surely affect the purchasing power of the railroads adversely. It should be borne in mind that the railroads are no more prosperous than the steel companies or other industries, and that they did not make any large earnings during the war, so that while there has not been so much reduction in railroad rates since the war, the reason is that railroad rates did not reach such a high percentage above normal during the war as some other things did; and it should also be borne in mind that the average freight rate is about 65 per cent higher than it was in the decade prior to 1910, while the average price of all commodities is about 67 per cent higher than was the case during the above mentioned period.

By W. B. Storey

President Atchison, Topeka & Santa Fe

We have recently ordered 2,500 refrigerator cars which will go into our 1922 budget, the cost of these cars amounting to \$8,000,000. We do not contemplate any other large equipment purchases during the year, but are likely to spend \$2,000,000 additional. Our extensions of and additions and betterments to our plant may call for an additional expenditure at least as large as the average for each of the past two years, or about \$10,000,000. Our budget for the coming year has not yet been presented, so that these figures indicate only in a very general way what our program is likely to be. We have no details available which would indicate how much of this is likely to be of special interest

to the steel industry, nor is our budget ever worked out in such a way as to furnish this particular information separately.

By Charles Donnelly

President Northern Pacific

I have your letter, inquiring whether we have in contemplation any program involving during the year 1922 the purchase on a large scale of equipment, rails, shop machinery, etc. In reply, I have to state that we have not. Whether, as the result of the developments of the next three or four months, we may adopt a somewhat limited program of this character I cannot now say, but at present no plans are under consideration for purchases on any very considerable scale.

By W. G. Besler

President Central Railroad Co. of New Jersey

We have just placed an order with the American Locomotive Co. for 25 heavy Mikado engines. We are studying our requirements with respect to rails, ties, lumber, etc., and will determine later on the extent of our orders for this class of material. We are not prepared to do so at present.

By H. F. Byram

President Chicago, Milwaukee & St. Paul

I regret that there does not seem to be anything very encouraging in the outlook for increased purchases of iron and steel by the railroads until the general business of the country revives. Improvements on the railroads of the country practically have been at a standstill for several years and it is the improvements in equipment and facilities which require the largest proportion of steel and steel products.

The meager volume of business handled by the railroads during the past year, and which still continues, does not require any additional facilities in either the road or equipment of a railroad. In fact, the present facilities are more than adequate to handle promptly and satisfactorily all the business offered, and the high labor cost left to us as a legacy from the period of Federal control has so narrowed the spread between expenses and earnings as to leave little room for providing surplus funds which might be invested in anticipation of the return of business prosperity, which we all hope is not far away. But, until these difficulties are overcome or reconciled and the needs of the railroads for increased capacity are more pronounced than at

present, there is not likely to be an increased demand by the railways for iron and steel products.

By J. S. Pyeatt

President Gulf Coast Lines

We do not contemplate the purchase of any new equipment during the coming year. Delivery has been completed recently of new freight and passenger cars and locomotives, aggregating \$3,500,000, which we believe will enable us to meet our requirements for another year. Our purchases of rail and other material and supplies we anticipate will be normal during the year 1922.

By William Sproule

President Southern Pacific

Business throughout the country is marking time waiting until prices have dropped to a fairly normal basis. This means that the pre-war state of mind is returning and purchasers are not willing to proceed on a relatively high scale of prices.

By William H. Finley

President Chicago & North Western

I believe that the buying power of the railroads is one of the big factors in business activity. It is unfortunate, however, that the financial condition of the railroads does not indicate that they will be warranted in making any large purchases at present. We are considering the matter very carefully, but cannot make any definite plans owing to the decline in our income. Like the careful mariner when in troubled waters, we are constantly on the lookout, taking soundings to determine the safety of our position and will be prepared to place orders as soon as we are assured that the ebbside has turned.

By J. L. Lancaster

Receiver Texas & Pacific

Under existing conditions it will not be possible for the Texas & Pacific Railway to make extensive purchases of additional locomotives, cars, rails and tools for repair shops, or undertake to any great extent construction of bridges, shop buildings and railroad stations.

By Carl R. Gray

President Union Pacific System

Our budget has not yet been finished for 1922, and will not be definitely acted upon for 60 or 90 days. I anticipate that in this section, at least, the railroad business will be quiet and on something like our present levels until spring, when I hope for an improvement.

By S. M. Felton

President Chicago Great Western

I do not believe there will be any extensive buying by the railroads during the coming year. Much depends on business conditions. Railroad traffic has been falling off very sharply during the last few weeks and unless there is some decided improvement there certainly will be very little buying, beyond that which is necessary for maintenance and renewals. In the first place, we have a demand from all sides for a reduction in our rates; in order to meet this we are trying to get our

wages down, but so far have not accomplished what is necessary. It is certain that unless railroad operating expenses can be materially reduced and traffic improves, there will not be any money for the purchase of additional locomotives, cars, etc. There will be, as is always the case, some scattered purchases by lines that are financially strong, but a great number of the roads are not in a position to make any large investments and many of them are still waiting for a settlement of their claims against the Government for under-maintenance during the period of Federal control. If reasonable sums should be paid out by the Railroad Administration in settlement of these claims the money would undoubtedly be invested in repairs and renewals of equipment and in rehabilitation work generally, and to that extent would be helpful. I am sorry I cannot give you a more favorable report of the situation.

By Percy R. Todd

President Rangor & Aroostook

During the past year this company purchased six heavy Consolidation freight locomotives, 30 Hart ballast cars, and a new 120-ton wrecking derrick, and in October ordered 200 steel underframe box cars, which have not yet been built; this will about exhaust our financial ability in the way of ordering new equipment, therefore we have no extensive program in this direction for next year.

By J. H. Hustie

President Boston & Maine

We have no plans for the coming year for any important permanent construction of bridges, line extensions, shop buildings or stations. We shall probably order certain equipment, but the order will not be large and final decision has not been made in the matter, so that I am unable to make any announcement at this time. As to the railroad outlook for 1922, I can only say that I believe it will continue to be a period of readjustment.

By W. L. Mapother

President Louisville & Nashville

The Louisville & Nashville Railroad Co. has certain extensive plans for addition and betterment expenditures, including equipment, but the existing business and financial conditions serve to preclude the possibility of any immediate or early decision and announcement.

[Since the above was written the Louisville & Nashville has come into the market for 50,000 tons of rails, which will be rolled at the Alabama mill.—EDITOR.]

By F. D. Underwood

President Erie Railroad

The purchasing power of railroads is not being developed as fast as we could hope. Personally I see but small hope of an increase in business until the prospects of another crop in the United States are assured. There is at present a great surplus of equipment, which fact will minimize orders for next year.

By William A. Winburn

President Central of Georgia

You ask our program for additional cars, rails, etc., and our plans for permanent construction requiring iron and steel. The latter has been provided for. It

is our purpose to purchase during the coming year about 4000 tons of steel and five hundred box cars.

By J. J. Bernet
President Nickel Plate

Our company has not outlined any program or budget for buying in the year 1922. While we have been going along in a normal sort of way, we have not made any plans for anything unusual during the coming year.

By M. M. Bremner
President, Minneapolis & St. Louis

To my mind it is very difficult to forecast what may be expected from the railroads in the year 1922 with respect to purchases of locomotives and cars and in the way of permanent construction.

Undoubtedly, there is a great need for more equipment and much maintenance of roadway and existing equipment has been deferred during the past year and temporary expedients have been resorted to because of lack of funds to do things in a proper way.

To my mind what the railroads will do in the way of purchases will depend entirely on the business outlook. But very few railroads are in a position at the present time to borrow money on terms that are at all favorable, and the result is they must depend upon their revenues until such time as their credit is re-established. Just at the present time we are passing through a very severe slump in business with a very serious impairment of revenues. Whether this slump is temporary in character or will continue for some time to come, it is impossible at the present time to determine. My own view is that it will continue for from sixty to ninety days.

Dependent as the railroads are upon their earnings, there is little encouragement for them to extend their purchases, confronted as they are with increasingly insistent demands for reductions in rates, regardless of their ability from a revenue standpoint to stand the reductions. Already the Interstate Commerce Commission has ordered a reduction in the rates on grain and grain products, which will mean a very serious impairment of the revenues of the Western carriers and this may be but a forerunner of further reductions.

I believe that if the agitation with respect to decreased rates could be stopped and no encouragement from official sources be given thereto, there would soon be a decided improvement in general business conditions. The fact is that in nearly all lines of industry, at the present time, shippers and consignees are holding back, believing that rates will be reduced and that by holding off they will make an additional profit for themselves by the amount of the reduction, whatever it may be. If no hope of a reduction was before them, they would probably adjust their business affairs to the present level of rates and business would go on as usual.

Constant agitation with respect to a matter such as freight rates, which enter into practically every transaction of life, cannot be otherwise than harmful. What the business world needs is stability and this cannot be brought about if this agitation is to go on.

Will Sell Flat Cars

WASHINGTON, Jan. 3.—The Emergency Fleet Corporation will receive bids up to Jan. 12, at its offices in Washington, for 309 standard gage flat cars, ranging from 25 to 40 tons in capacity; 15 box cars with a capacity of 30 tons each; 35 gondolas with capacities ranging from 20 to 40 tons; and 7 locomotives. This equipment is located at Bristol and Hog Island, Pa., and is offered for sale "as is where is."

THE HARDWOOD DECISION

Co-operation Somewhat Disturbed by Action of the Supreme Court

WASHINGTON, Jan. 3.—The majority opinion of the Supreme Court in the hardwood case has had the anticipated result of somewhat disturbing co-operation between trade associations and the Department of Commerce. One association has given notice that it will not submit further statistical data to the Department of Commerce for use in the Monthly Survey of Current Business, issued under the direction of the Bureau of the Census. Other associations have denoted that they are uncertain as to whether they will co-operate further, being apprehensive of the effect of the decision of the Supreme Court. The chief difficulty disturbing this co-operation, which has been carefully urged and built up upon the initiative of Secretary of Commerce Hoover, has been the doubt left as to the actual effect of the decision.

It is evident that careful analysis of the opinion has left the general impression that it affects the activities of only a small portion of trade associations of the country, but many associations which feel that they are not affected, are at the same time, left in a state of doubt pending the clear interpretation of the decision by the Government. For this reason, it is believed that some of them, at least, will hesitate to co-operate with the Department of Commerce until Attorney General Daugherty presents an official statement expressing his views in the matter. As has been previously stated, however, apparently even this will not satisfy representatives of some associations, who think that the only remedy assuring their legality lies in the enactment of legislation, though passage of such legislation, if undertaken, probably would require a long time.

Secretary Hoover's View

Secretary Hoover has reiterated his view that the decision will have a bearing on only a small number of trade associations, estimating that it will not involve over 10 per cent of the total. This calculation is based on the survey made sometime ago by the Department of Commerce as to the activities of the 1700 or 1800 trade associations of the country.

Nathan B. Williams, Associate Counsel of the National Association of Manufacturers, takes the same view that Mr. Hoover expressed and thinks that trade associations should continue their legitimate statistical activities and supply data to the Department of Commerce for public use. In an interview with THE IRON AGE Mr. Williams said:

"As a result of the Supreme Court decision in the hardwood case, some apprehension has become manifest as to the legality of the activities of trade associations who have been supplying current statistical information to the Department of Commerce, for use in its Monthly Survey of Current Business.

"This anxiety appears to be the result of the popular impression as to just what practices were condemned by the Supreme Court of the United States in the case of the American Hardwood Manufacturers' Association, decided Dec. 19, 1921.

"Early in August of this year Secretary Hoover issued a statement with respect to trade associations and their work, wherein he said:

For some weeks the department has been making a careful study of the purposes and activities of trade associations. We find that the vast majority of such associated activity is a constructive contribution to national welfare.

The department wishes to co-operate with such associations as wish it in the collection of information as to production, stocks of raw and other materials, percentage of industry in active operation, total orders, and other accomplished facts of interest to them and in the making of the information available to the whole public.

The making of such information currently public acts alike to protect legitimate business enterprise and the public interest.

Selling American Machine Tools in Europe

Difficulties Encountered in all Countries Due to Disparity in Exchange and to German Competition, Which May Correct Itself

BY E. M. HARTRIDGE*

WHEN the armistice was signed, opinion was very much divided as to the future of the machine-tool markets in Europe. The same is true to-day with the future as clouded and uncertain as it was three years ago. It is becoming more and more difficult to sell American tools in Europe and unless the American manufacturers awake to this fact and take energetic measures they will gradually lose all the prestige and business that has taken years to build up.

In France, just after the armistice, there was considerable buying due to the conversion of munition factories into peace-time productivities. Also, there were the destroyed plants in the north of France on which rebuilding work was commenced almost immediately. The pre-war factories naturally returned to the manufacture of articles they were engaged in before the war, but with the added feature that their productive capacity as a whole was greatly increased. Many new factories had also sprung up during the war and they all had extensive plans for the future. Everybody wanted to keep his factory running at full war-time production and there was a feverish rush to get started on new programs and to get ahead of the other fellow.

For a time things looked rosy and there was a brisk demand for American tools, as the surplus machines and the war stocks of the United States Government had not yet begun to be thrown on the market, nor had the German competition commenced. Soon, though, things began to happen. The bottom commenced to drop out of the French as well as other European exchanges. There was a scarcity of coal and raw materials, and labor began making impossible demands. The worst, though, was when the factories were ready to produce and it was found that there were not sufficient markets to keep them busy. It was impossible to develop markets quickly enough to keep the greatly increased productive capacity of these pre-war factories going and at the same time to absorb the output of all the numerous new factories which had sprung up during the war. The automobile business in particular was greatly overdone. The result was that something was bound to happen and it did. There was a general slump followed by failures and shutting down of factories. The older and more firmly established industries have, as a rule, weathered the storm, but even with them it has been a severe struggle. All this has had the effect of automatically eliminating the surplus production in France and has sent many laborers and mechanics back to the farms where they are badly needed.

Little Buying of American Tools

The reaction will undoubtedly be a healthy one with a gradual industrial growth of France in keeping with the present market demands and those that might be developed. At the present time, there is very little buying of American tools. With francs at 14 to 15 to the dollar, it takes courage even to quote prices on American tools. The smaller and provincial concerns do not know anything about exchange and they look upon American manufacturers—and the dealers who sell American tools—as being profiteers and robbers on account of prices being so high when translated into depreciated currency values. It is not an unusual occurrence for salesmen to be actually abused and insulted when quoting on American tools. Of course, the larger manufacturers are more familiar with the

exchange problem and are more lenient in their criticisms, but even they say frankly that they will not buy American tools at the present prices if they can possibly help it. The result is that American machines are only bought when it is impossible to buy elsewhere.

German competition—if it can be called such at the prices at which they are selling—is becoming steadily more and more demoralizing and French manufacturers are turning to Germany to supply their demands. This particularly as the French Government encourages buying in Germany on account of the favorable exchange and also as, through the Wiesbaden agreement, it has undertaken to receive payment of reparations in commodities instead of money.

There is still considerable demand for machine tools in the north of France in re-establishing destroyed factories, but such buying is largely financed by the French Government with the result that Germany is getting the greater part of this business and only rarely is an order secured for an American tool. For the first half of the year 1921 it is reported that France bought machines in Germany to the amount of 306,500,000 francs, which figures are indeed formidable, particularly when it is considered that from the latest available figures only about 20 per cent of the concerns operating in the North in 1914 are completely restored. There are other concerns partially restored, so that it might be said that the industries in the North are on the whole about 50 per cent restored. From the present indications it looks as if the Germans will get the remainder of this business unless the American manufacturers awake to the seriousness of the situation.

Buying in Germany to Rehabilitate Plants

During a recent visit to the north of France, I had the opportunity to visit and discuss the situation with the managing director of one of the largest and oldest works in that section, whose opinion is highly respected throughout the metal working industry. Before the war and until recently, this concern had largely favored American tools but lately had begun buying in Germany. When asked about this, the managing director explained that they simply could not continue paying such high prices for American tools when the same tools could be bought in Germany for less than half the price. The result is that they, as well as others, have recently been buying very heavily in Germany such machines as vertical turret lathes and boring mills, radial drills, planers, etc. Many of these machines have arrived and are now working and giving satisfaction. A 5½-ft. radial drill was pointed out which cost only 22,000 francs, whereas the price of a similar best make of American tool would be around 60,000 francs to-day. A 42-in. German vertical turret lathe costs 50,000 francs, while the prices on the best American tools of the same capacity range from 113,000 to 150,000 francs. One of the best German makers of grinders quotes 10,000 francs delivered France for a 12 x 36-in. machine while prices quoted on the best American tools vary with different makes from 30,000 to 45,000 francs. These are only a few examples, and in consequence everybody in the North—as well as elsewhere in France—is buying from Germany.

The dealer who confines his efforts solely to the sale of American tools is helpless to do much in the face of this situation except to continue making extra efforts and using all the strategy at his command, which may be occasionally rewarded by a small order

*Vice-president, Allied Machinery Co. of America, Paris, France.

when a tool cannot be obtained quickly enough from Germany or because it is not considered worth while going to Germany for a single machine. The dealer can talk quality until he is out of breath but to-day prices are invariably the final deciding factor. Even if in desperation the dealer quotes below actual cost—as is frequently the case nowadays in his efforts to get orders—his prices are still far above the German prices. It is sometimes possible to obtain an order in competition with the Germans if the difference in price is only about 25 per cent, but when the difference is so great as it is to-day, it is practically impossible to compete. There is not only the German competition in France at the present time but there is also a large quantity of surplus American tools which has been thrown on the market, and is being sold at ridiculously low prices. Until these surplus machines are finally absorbed, this kind of competition will be continually encountered.

Belgian Market Also Depressed

The same general remarks as the above hold true for Belgium, Italy, Spain and Switzerland with slight variations. Belgium had hardly got started manufacturing when the slump came and as she did not have the momentum to carry her along, the depression has been felt more in Belgium than it has in France. Also, on account of the large Army stocks of American tools dumped in Belgium by the United States Government, there has been comparatively very little buying outside of this source. Moreover, the German competition is felt very keenly in Belgium, and it was felt in Belgium sooner than in France.

Italy has gone through practically the same stages as France has—although, of course, on a smaller scale—with the added features of having had serious labor troubles. Everybody is familiar with the way the Communists took possession of the factories and only turned them back to the owners after having failed to operate them successfully. That this has demoralized the country to a large extent is shown in the general lack of confidence of capital to invest in industrial enterprises as long as the socialistic laboring element dominates the situation as it has in the past, and as it still does to a large extent. As a result, recovery is slow and many of the larger manufacturing industries are still entirely shut down. Italy is also handicapped by having to buy practically all of her raw materials and coal which cost dearly on account of transportation and the depreciated value of the lira. The German competition is also particularly keen in Italy—even more so than in France—as the bars have been entirely let down to German goods which are beginning to flood the country. However, Italy is making strenuous efforts to recover.

Spain Not Strong Industrially

As for Spain, there is not much to say. The present depression has hit this country as well as other parts of the world. The future of the manufacturing industries in Spain is very uncertain and is on an unstable basis, and it is a question whether they will be able to compete with surrounding countries such as England, France and Germany. Spain was not a manufacturing country before the war and it was only the war that gave her a start in this direction. There is very little machine tool buying being done in Spain and what there is is mostly for the cheapest kind of tools of Spanish, German and other makes. The Germans are very active in Spain and have dumped large quantities of cheap machine tools on the market which sell at very low prices. This makes it very difficult to compete with American tools.

Switzerland has probably been hit harder than France, Spain, Belgium or Italy. Before the war Switzerland sold her products largely in the surrounding countries, but now that the exchange of these surrounding countries is so greatly depreciated, they cannot afford to buy in Switzerland, which has been simply flooded with German goods, including machine tools and small tools. There is probably more unemployment in Switzerland in proportion to its size than in France, Belgium or Italy. This means that there is practically

no demand for American machine tools in Switzerland and probably will not be until the factories in Switzerland are busy again.

Situation May Mend Itself

As for the German competition, it is true that this is very serious, but the situation is not as bad as might appear on the surface. As the economists point out, the Germans cannot do all the work of the world now any more than they could before the war, as their capacity is no greater now than it was then. They were very busy and effective in competition before the war and yet the rest of the world found enough to do. They are no more formidable in industrial ability and equipment now than they were then. The so-called advantages of the Germans on account of the depreciation of the mark—which has upset all relative values—is causing the German authorities and financiers the greatest anxiety.

In terms of paper marks, many salaries in Germany are still only four to six times higher than the peacetime level, although wages generally have risen to 15 times that amount. But at the same time the ratio of paper money values to gold is about 70. This will probably result in a tremendous conflict between labor and capital on the wage question during the winter and spring. The German Government, which derives a great part of its revenue from taxes on German production, is also hard hit because it is unable to collect an amount commensurate with the decline in values. The German financial structure is in serious danger of collapsing if strenuous measures are not taken to readjust relative values, and the result will be that prices will have to be greatly increased. The Germans are also under serious handicap from the requirements that 26 per cent of the value of all of their exports must be paid into the reparation fund. The tendency of this, of course, will be to pass this on to the purchaser. Germany is gradually waking up to the fact that she cannot replace the tools and other goods at the prices at which she is now selling. It has just been announced that export restrictions are being placed to prevent the wholesale shipment of goods out of the country which is now going on, and to preserve stocks of raw materials. There are also rumors of establishing a special currency—based on the value of a gold mark—for purchases intended for export in order to avoid a general increase of prices on goods intended for internal consumption as now threatened. Therefore the future is not as bad as it may appear now. It is the next six months or a year that will be the critical period and it will largely depend on the American manufacturers whether they will hold the European markets or lose them to the Germans.

American Manufacturers Must Wake Up

From the above it can be seen that the situation in Europe to-day which confronts the American manufacturers, as well as the dealers who sell exclusively American tools, is very serious indeed. The selling organizations which American manufacturers are depending on for their foreign business are real pioneers and must be good merchants as well as good salesmen and engineers. Even in face of the serious German competition they must continue to carry large stocks and finance shipments, as well as take all the risks of fluctuating exchanges, bad credits, and all the other evils which make it more difficult to do business in Europe to-day than ever before, or probably than it ever will be again. Without proper support it takes courage for a dealer to stay loyal to the American manufacturer and to continue to sell American tools exclusively, in the face of the present difficulties. In fact, many dealers following the course of least resistance, have turned to selling German machine tools. The American manufacturers should appreciate the courage and sacrifices of the dealers who remain loyal and in turn should assist them in every way. Not only should they give them the lowest prices possible, but they should look upon their foreign agents as a part of their own selling organization, giving them the same facilities as to their own organization.

Manganese Steel Made in Electric Furnace

(Continued from page 8)

By means of baffles and flues this flame is so controlled that it follows the roof of the furnace, and the charge is heated by radiation. This ability to prevent the flame from impinging on the castings is very important. As manganese steel can not be cut with a tool all finishing must be done by means of grinding wheels. If the flame were to strike the castings some would be heated much hotter than others, and the scaling would seriously affect the dimensions of the finished work. A small variance is allowed for this and is taken care of by the pattern maker. Unequal heats would cause great trouble after the quenching operation, resulting in warped and twisted castings, and might even cause rejections, due to tearing and checking caused by the unequal contraction.

The castings are loaded on the cars in a regular and even manner, castings of as nearly the same size as possible making up the charge. These are brought up gradually to 1800 deg. Fahr. and are allowed to soak until heated evenly clear through. The car is then pulled and the charge quenched in water as quickly as is possible. Large tanks are used for this purpose, so arranged that a constant circulation of cold water is obtained. When the charge is cold they are withdrawn and finished ready for shipment, after being inspected and straightened where necessary.

This is one of the peculiarities of manganese steel. All other steels when quenched in this manner would become glass hard. Manganese steel becomes slightly softer in Brinell number, and changes from a brittle metal to one of abnormal toughness, having a merit number (tensile strength \times elongation) of about 7,000,000. As a means of regulating the heat in the furnace Segar cones are used. While these are not as efficient as a good system of recording pyrometers, they give good results.

Physical and Chemical Testing

At about the middle of the pour several different sets of test bars are made.

Breaking test.—A bar 18 in. long, and 3 in. square is cast and used for the breaking test. This bar is treated and placed on sharp supports 16 in. apart. A heavy weight is then dropped on this bar, which must stand a definite amount of blows to meet the specification. The test used is to drop a ball, weighing 4000 lb., eight times from a 6-ft. height, making an equivalent of 192,000 foot pounds.

Pulling or strength test.—A bar is cast large enough to make a standard section pulling bar when ground down to size. This is then pulled in a similar manner to carbon steel on any class of testing machine. Manganese steel has a peculiar property here. Under the pull it begins to stretch at one point. Then instead of continuing its stretch there, it begins at another point. As soon as the elongation is constant over the whole section undergoing the test, it continues this operation until ruptured. This results in a rather low elastic limit as compared to the great strength and elongation. Tests from manganese steel have shown as high as 150,000 lb. per sq. in., with an elongation of over 50 per cent. Manganese steel, when forged or worked in any manner, shows vast improvement over the ordinary cast tests. Cold working raises its tensile strength and elastic limit but lowers its elongation. Tests of cold worked material have shown as high as 250,000 lb. per sq. in. tensile strength, with an elastic limit of 230,000 lb. per sq. in.

Bending test.—This is the most important test given and is made on every heat. Several bars are cast on end; one for the chemical analysis; one to be treated in the laboratory and bent; and one for each load of

castings from the heat when treated. These bars are 12 in. long, $\frac{1}{2}$ in. thick and $\frac{1}{4}$ in. wide. One of the bars is taken to the laboratory and brought up to 1800 deg. Fahr. in a small electric oven. It is then quenched in water and bent until it breaks. This shows the character of the steel from the heat. The same operation is performed on the bars which go through the regular process with the castings. These are then compared and serve as a check on the treating operation. Large numbers of these bars will bend flat on themselves without any sign of checking. All bendings are made on the cold stock. From several hundred tests over a period of two years, on electric furnace manganese steel, it was found that the best bends were those where the manganese ran from 12 to 13 per cent. Regardless of the carbon, silicon, or phosphorous contents on these heats, the test bar always bent flat on itself without any visible checking on the outside of the bend. This is a pretty rigid test to meet with a steel having over 100,000 lb. per sq. in. tensile strength.

Sampling

High speed steel bars $\frac{5}{8}$ in. round and about 3 in. long are forged down to the shape shown at A, as shown in an illustration. These are then given a rough grinding to the shape B. The semi-finished drill is then heated slowly in a forge fire to a dull red, or about 1500 deg. Fahr., and then heated rapidly to a white heat. The temperature is then about 2300 deg. Fahr. and the end of the tool is just beginning to drip and looks greasy. The tool is then suddenly quenched, point down, in kerosene for three seconds and then quenched to a black in water. The tool is ground lightly on a wet wheel and is then ready to drill.

A very heavy drill press is used where high leverage can be obtained and the sample is drilled from one of the bending test bars cast on the heat desired.

The drillings are then screened to remove any fine particles of dirt and looked over carefully for any small chips which may have fallen from the drill, and are taken to the laboratory for analysis.

Influence for Consolidation

Youngstown, Ohio, Jan. 3:—Prospect of continued operating losses for some time to come with leading independent steel makers is expected to exert a strong influence toward consolidation. Assembling of valuation data on plant, coal and ore holdings is now under way, and when completed will furnish the basis for more definite discussion as to merger terms. Losses encountered in 1921 by independent interests have served to stimulate the movement for an amalgamation, with the benefits of reduced costs of operation, shipping advantages and sizable overhead reduction.

In a message to its employees, a leading independent producer in the Mahoning Valley points out that "not a steel company in the United States made any money in 1921. On the other hand, many of them lost vast amounts. The balance sheets of many large companies will show an actual loss of millions of dollars. Only the fact that all had enjoyed prosperity for several years prevented absolute bankruptcy in many cases."

"The year 1921 was not a pleasant one for workers in the steel industry nor for most of those who work and conduct business of one kind or another in this country. It was one of the worst years from an industrial standpoint that the industry has ever known."

"The scarcity of work and the great reduction in earnings seemed even worse than they were when compared with conditions for several years past, and it required a good deal of philosophy to accept them without complaint. Nevertheless, we can find some comfort in the fact that these conditions were general and everybody had to suffer from them in about the same degree. Where wages were not reduced, there was little work, and where people did not have to labor, but depended on dividends, they suffered even more than the man whose capital is his labor."

LARGE GAIN IN IRON OUTPUT

Six Furnaces Blown In, One Blown Out

December Production 6013 Tons Per Day Larger Than That of November

Despite the temporary banking of several furnaces, usual over the holiday period, the upward swing in the pig iron output of the country continued its momentum in December. The gain per day last month was over 6000 tons as contrasted with 6968 tons per day in November over October and with 7465 tons per day in October over September. The December total is only about 400,000 tons under the February output and is the third largest month in the year.

The production of coke and anthracite furnaces for the 31 days in December amounted to 1,649,086 gross tons, or 53,196 tons per day, as compared with 1,415,481 tons or 47,183 tons per day for the 30 days in November according to data collected largely by telegraph. The increase in December over November was 233,605 tons, or 6013 tons per day.

The total number of furnaces in blast on Jan. 1 is 125 as compared with 120 on Dec. 1, with 96 on Nov. 1, with 82 on Oct. 1, with 70 on Sept. 1, and with 69 on Aug. 1, the low point for the year. In December six furnaces were blown in and one blown out.

A computation of the capacity in blast Jan. 1 is difficult because of the telegraphic and other methods of obtaining the data, due to the holidays and the temporary banking of furnaces. The December output of manganese-iron alloys was 3953 tons, one furnace having been blown in on this product during the month. Of this total 50 tons was spiegeleisen.

Daily Rate of Production

The daily rate of production of coke and anthracite pig iron by months, from December, 1920, is as follows:

Daily Rate of Pig Iron Production by Months—Gross Tons	1920			1921		
	Steel Works	Merchant	Total	Steel Works	Merchant	Total
December	66,037	20,185	87,222	62,327	15,618	77,945
January, 1921	58,060	11,127	69,187	42,691	8,777	51,468
February	33,854	5,914	39,768	33,054	6,340	39,394
March	29,444	6,050	35,494	23,086	4,803	27,889
April	26,037	4,743	30,780	27,189	5,661	32,850
May	33,365	6,850	40,215	37,960	9,223	47,183
June	41,173	12,023	53,196			

The figures for daily average production, beginning with January, 1915, are as follows:

Daily Average Production of Coke and Anthracite Pig Iron in the United States by Months Since Jan. 1, 1915—Gross Tons										
	1915	1916	1917	1918	1919	1920	1921			
Jan.	51,659	102,746	101,643	77,799	106,525	97,264	77,945			
Feb.	59,813	106,456	91,473	82,835	105,006	102,720	69,187			
Mar.	66,575	107,667	104,882	103,618	99,685	108,900	51,468			
Apr.	70,550	107,592	111,165	109,607	82,607	91,327	39,768			
May	73,015	108,422	110,238	111,175	68,002	96,312	39,394			
June	79,361	107,053	109,002	110,793	70,495	101,451	35,494			
July	82,691	104,017	107,820	110,354	78,340	98,931	27,889			
Aug.	89,666	103,346	104,772	109,341	88,496	101,529	30,780			
Sept.	95,085	106,745	104,465	113,942	82,932	104,310	32,850			
Oct.	100,822	113,189	106,550	112,482	60,115	106,212	40,215			
Nov.	101,244	110,394	106,859	111,802	79,745	97,830	47,183			
Dec.	103,333	102,537	92,997	110,762	84,944	87,222	53,196			

The furnaces blown in during December include the following: Brooke furnace in the Schuylkill Valley; Sheridan furnace in the Lebanon Valley; B Federal furnace in Illinois; one furnace of the Colorado Fuel & Iron Co. in Colorado, No. 2 Hattie Ensley furnace of the Sloss-Sheffield Steel & Iron Co. in Alabama, and the furnace of the St. Louis Coke & Chemical Co. in Illinois. Three of these furnaces were blown in after Dec. 23; the other three were blown in Dec. 5, Dec. 12 and Dec. 19, respectively.

Only one furnace was blown out during December, one of the Johnstown furnaces of the Cambria Steel

Co. in western Pennsylvania. Several furnaces were banked over the holidays.

Production of Steel Companies—Gross Tons

Returns from all furnaces of the United States Steel Corporation and the various independent steel companies, as well as from merchant furnaces producing ferromanganese and spiegeleisen, show the following totals of steel making iron, month by month, together with ferromanganese and spiegeleisen. These last, while stated separately, are also included in the columns of "total production."

Production of Steel Companies—Gross Tons

	Total Production			Spiegeleisen and Ferromanganese		
	1919	1920	1921	1919	1920	1921
Jan.	2,430,022	2,232,455	1,932,159	32,787	23,957	22,228
Feb.	2,209,470	2,181,679	1,625,695	28,105	28,038	29,013

Diagram of Pig Iron Production and Prices

The fluctuations in pig iron production from 1913 to the present time are shown in the accompanying chart. The figures represented by the heavy line are those of daily average production by months of coke and anthracite iron. The dotted curve on the chart represents monthly average prices of Southern No. 2 foundry pig iron at Cincinnati, local No. 2 foundry iron at furnaces in Chicago, and No. 2X at Philadelphia. They are based on the weekly quotations of THE IRON AGE.

Production of Coke and Anthracite Pig Iron in the United States by Months, Beginning Jan. 1, 1917—Gross Tons

	1917		1918		1919		1920		1921	
	1917	1918	1918	1919	1919	1920	1920	1921	1921	1921

Dec.	2,882,918	3,433,617	2,633,263	2,703,855	1,649,086					

Ttl. yr. *38,185,981 38,508,047 30,582,878 36,414,114 16,543,686

*These totals do not include charcoal pig iron. The 1920 production of this iron was 323,396 tons.

The Kelly Nail & Iron Co. reports that its Sarah furnace at Ironton, Ohio, will blow in the first week in January.

The Full Line Represents the Daily Production of Pig Iron and the Dotted Line Is the Average of the Price Per Ton of No. 2 Southern Pig Iron at Cincinnati, Local No. 2 Iron at Chicago and No. 2X Iron at Philadelphia

WILL DELAY TARIFF BILL

Probable Effect of Death of Senator Penrose— Senator McCumber Will Be Chairman

Washington, Jan. 3.—The death of Senator Penrose of Pennsylvania, chairman of Committee on Finance, is not expected to change plans for preparing the tariff bill nor will it be likely to change the policy as to the system of valuation for imposing duties or prospective rates. Senator McCumber of North Dakota, who will succeed to the chairmanship, is in sympathy with the protective policy of Senator Penrose and, if anything, is more of a protectionist with respect to agricultural products than the late senator from Pennsylvania was. One important result of the death of Senator Penrose is to swing the powerful position of chairmanship of the committee from a senator from an industrial State of the East to one from an agricultural State of the West.

Coming from Pennsylvania, Senator Penrose undoubtedly showed more interest in and understanding of the steel schedule than has been manifested by Senator McCumber, but it is believed the latter is largely in accord with the views of Senator Penrose toward the schedule. Senator McCumber plainly is of the opinion that manufactured products require fair protection but that the same is also true of agricultural products. In this connection, it is recalled that the late

Senator Penrose during hearings on the steel schedule declared that the requests for protection made by steel producers were more modest than those of any other interest.

It is a source of interest as to whether the vacancy in the committee will be filled by a senator from an industrial State or one from an agricultural section. The death of Senator Penrose may have the effect of further delaying passage of the tariff bill, for it is well recognized that his remarkable ability and strong personality were being relied upon to aid in getting the bill through the Senate as quickly as possible.

COMING MEETINGS

January

American Engineering Council. Jan. 5 and 6. Meeting at Cosmos Club, Washington. Secretary, L. W. Wallace, Washington.

February

American Boiler Manufacturers' Association. Feb. 13. One-day winter meeting. Fort Pitt Hotel, Pittsburgh. Secretary, H. N. Covell, 181 Dikeman Street, Brooklyn, N. Y.

American Institute of Mining and Metallurgical Engineers. Feb. 20-25. Spring meeting. Engineering Societies Building, New York. Secretary, Frederick F. Sharpless, 29 West Thirty-ninth Street, New York.

New Iron and Steel Works Construction

Open Hearth Capacity, Completed or Projected, Smallest in
Years—Blast Furnace Additions Less
Than in 27 Years

NEW low records, both in open-hearth and blast furnace capacity completed and in new capacity under construction as the year ended, were made in 1921. Because of the year's severe depression, as well as the large war-time additions to the country's producing capacity, expansion was not to be thought of, and only a part of the work under way early last year was finished. This is true of both open-hearth and blast furnace construction.

In blast furnaces it is necessary to go back at least 27 years to find any parallel, while in open-hearth building the capacity completed and projected is not only less than that of a year ago but is much smaller than anything recorded in over 10 years.

The high record for new capacity completed was in 1917—97 open-hearth furnaces having an estimated output of 4,326,500 gross tons per year. In new capacity projected and under way the record was 72 furnaces in 1916, representing a capacity of 4,515,000 tons per year. In pig iron the maximum records were 14 furnaces completed in 1917 and 25 new furnaces under way in 1916.

New Open-Hearth Capacity in 1921

In 1921 the new open-hearth capacity completed amounted to only 247,500 gross tons. This compares with 675,000 tons added in 1920 and with 625,000 tons added in 1919—the leanest years at that time in many. The summary below shows 8 open-hearth furnaces completed in 1921 as compared with 20 in 1920 and 9 in 1919. The 1921 additions in the form of a table follows:

	No. of Furnaces	Annual Capacity Gross Tons
Independent Companies	8	247,500
United States Steel Corporation ...	0	...
Total	8	247,500*

*Includes Bessener plant (one 15-ton converter and a 600-ton mixer) of the Steel & Tube Co. of America at Indiana Harbor, Ind.

The additions to open-hearth capacity in 1921 were the following:

Kansas City Bolt & Nut Co., Kansas City, Mo., one 50-ton furnace; Follansbee Brothers Co., Toronto, Ohio, four 40-ton furnaces; National Steel Foundries, Milwaukee, Wis., two 25-ton furnaces and Adirondack Steel Foundries, one 25-ton furnace. The Central Iron & Steel Co., Harrisburg, Pa., enlarged one 50-ton to a 90-ton furnace last year.

The United States Steel Corporation made no additions to its open-hearth capacity at any of its plants last year. This was also true of 1920.

Open-Hearth Construction for 1922

Open-hearth furnaces under construction, most of which will probably be completed in 1922, number 6, which compare with 15 projected in 1921 and with 22 in 1920. In 1916 there were 91 furnaces projected but their estimated capacity of 4,265,000 tons per year was less than that of the 72 projected for 1917. The total estimated capacity of the furnaces projected for completion in 1922 is only 217,500 gross tons. This compares with 430,000 tons planned for 1921, with 875,000 tons for 1920 and with 1,130,000 tons for 1919.

New installations contemplated for 1922 are as follows:

Mansfield Sheet & Tin Plate Co., Mansfield, Ohio, four 75-ton furnaces; Kansas City Bolt & Nut Co., one 50-ton furnace and Ohio Steel Foundry, Lima, Ohio, one 25-ton furnace. The Central Iron & Steel Co., Harrisburg, Pa., plans to enlarge one 40-ton to a 90-ton furnace this year.

The United States Steel Corporation makes no mention in its report of any additions to its melting capacity in 1922.

Expressed in the form of a table the proposed new open-hearth capacity is as follows:

	No. of Furnaces	Annual Capacity Gross Tons
Independent Companies	6	217,500
United States Steel Corporation ...	0	...
Total	6	217,500

New Blast Furnace Construction

The record of additions to pig iron making capacity, exclusive of charcoal furnaces, is the smallest since 1914. Last year only one furnace was completed and it has not yet been blown in; in 1914 also only one furnace was completed. In 1920, there were 6 furnaces completed but in 1919 only 2. In 1918 the records show 8 furnaces completed and in 1917 there were 14. The one furnace completed last year represents a capacity of 180,000 gross tons of pig iron per year.

For 1922 our statistics show that there are two furnaces under construction for probable completion this year. These represent an estimated new capacity of 310,000 tons per year.

In the annual review issue of THE IRON AGE, Jan. 7, 1915, it was stated that new pig iron making capacity, completed and projected, was the smallest in 20 years. At that time only one furnace had been completed the year under review and there were three furnaces projected. With only one furnace completed in 1921 and two under way for completion in 1922, the present status of expansion is the smallest in 27 years.

The following table gives the details of new blast furnaces completed in 1921 and at present under construction:

Company	Completed in 1921	Under Construction or Projected
Trumbull Cliffs Furnace Co., Warren, Ohio	1	.
E. W. Mudge & Co. (Claire No. 1), Sharpsville, Pa.	1
Hamilton Furnace Co., Hamil- ton, Ohio	1
Total	1	2

Several companies rebuilt or are rebuilding their furnaces or plan to do so which will add materially to their capacity and efficiency. The new furnace of the Hamilton Furnace Co. and of E. W. Mudge Co., while replacing old furnaces, are being erected on new foundations.

The Steel Corporation

New construction completed during 1921 and that under way as of Jan. 1, 1922, by subsidiary manufacturing companies of United States Steel Corporation, is as follows:

Carnegie Steel Co.

Completed

Edgar Thomson Works: Additions to crane facilities in Nos. 2 and 3 foundries and foundry roll and machine shop; facilities and equipment for repairing plant locomotives; additional 1000-k.w. motor generator set in power house, and replacement of condenser air pumps in blast furnaces and No. 1 mill engine rooms.

Duquesne Works: Improved slag handling method at blast furnace No. 6.

Homestead Works: Six 125-ton pouring cranes at open-

hearth plant No. 8; hydraulic pumps and pressure system at 32-in. slabbing mill to serve the 32-in., 72-in., 84-in. and 140-in. mills and open-hearth plants Nos. 1 and 2; rebuilding two 5-hole banks of pit furnaces and installing transfer car at 32-in. slabbing mill and motor drive for 33-in. finishing mill.

Carrie Furnaces: Five 40-ton hot metal ladles and cars and six cinder ladles and cars.

Schoen Steel Wheel Works: Additional wheel-finishing machinery.

Ohio Works: New boiler plant and reinforcing bin system at blast furnaces Nos. 1 to 4.

McDonald Mills: 18-in. band mill and 10-in. hoop mill.

New Castle Works: Dry gas cleaner for blast furnace No. 1.

Farrell Works: Reconstruction of blast furnace No. 2 and electric handling equipment for cinder and refuse on pouring side of open-hearth department.

Clairton Works: Equipping six blooming mill boilers to burn coke breeze; twenty flat cars for open-hearth department and two additional primary coolers at by-product coke plant.

Under Way

Edgar Thomson Works: Six roll lathes for roll shop and a Greenawalt sintering plant No. 2 at briquetting plant.

Duquesne Works: Reconstruction of blast furnace No. 3 and stock yard.

Homestead Works: Tar burning system for open-hearth plant No. 3.

Carrie Furnaces: Increasing height of blast furnace No. 5.

Ohio Works: Reconstruction of three open-hearth furnaces.

Mingo Works: Three new hot blast stoves at blast furnace No. 2 and dry gas cleaner for blast furnace No. 3.

Illinois Steel Co.

Completed

South Works: Three waste heat boilers at No. 3 duplexing open-hearth plant.

Gary Works: Enclosing billet and blooming mill chipping yards; 200-ft. extension to electrical repair shop and additional equipment, and three coal unloading machines and enlarging unloading building at by-product coke plant.

Under Way

South Works: Gas engine driven electric power station.

Joliet Works: Rebuilding four batteries of ovens and regenerator walls at by-product coke plant.

Milwaukee Works: Extending building and crane runway at 9-in. merchant mill No. 2.

Gary Works: 12-in. and 20-in. strip mills.

Universal Portland Cement Co.

Completed

Buffington, Ind.: Additional kiln unit in burner building at mill No. 6.

Universal, Pa.: Coal drying and pulverizing plant; dust collecting system on kiln and dryer stacks and raw material building and dwelling houses and recreation center for employees.

Under Way

Buffington, Ind.: Dust collecting system in raw material building at mill No. 6 and water filtering and softening plant to serve mills Nos. 3, 4 and 6.

Universal, Pa.: Increasing raw material grinding capacity and clinker storage.

Minnesota Steel Co.

Completed

Duluth Works: Additions to 28-in. rail mill and extending ore, coal and stone storage yard.

Under Way

Duluth Works: Rod and wire mill and townsite extension and additional dwellings for employees.

Lorain Steel Co.

Completed

Johnstown Works: Extensions to iron and steel foundries buildings and new pattern storage building.

Under Way

Johnstown Works: Electric steel foundry with 4-ton electric furnace.

National Tube Co.

Completed

Lorain Works: two lap weld mills, additional coupling shop machinery and extension to machine shop; extending

blacksmith shop building and installing 1000-ton hydraulic forging press and 15-ton electric overhead traveling crane; stoker equipment for six boilers in by-product coke plant boiler house.

National Works: Ore thawing house at blast furnaces.

Continental Works: Equipment for making couplings, ½-in. and ¾-in. sizes.

Ellwood Works: Equipment for forming automobile axles, torque tubes, etc.

Under Way

Lorain Works: Rebuilding blast furnace No. 4; additions at slag crushing plant, and modernizing coupling finishing machinery.

National Works: Rebuilding blast furnace No. 2; remodeling pig casting machine.

Christy Park Works: Extensions to "horn" welding department to increase capacity.

American Steel & Wire Co.

Completed

Cuyahoga Works: Facilities for handling and storing hot rolled flats at Nos. 1 and 3 strip mills; patenting furnace and equipment for spring wire.

Newburgh Steel Works: New water cooling towers at reservoir.

Central Furnaces: Additions to slag crushing plant.

H. P. Works: New boiler plant.

Waukegan Works: New boiler plant.

Scott Street Works: Water filtration plant.

Braddock Works: Four additional annealing furnaces.

Worcester, North Works: Additional electro-galvanizing equipment.

Under Way

Cuyahoga Works: New machine and electric repair shop buildings with equipment and additional storehouse facilities.

American Works: Additional pot annealing facilities.

Salem Works: Twenty double blow roofing nail machines.

Braddock Works: Additional cleaning house facilities and rearranging equipment.

Trenton Works: Extension to rope shop and equipment to manufacture special rope for export.

Worcester, North Works: Continuous cold rolling equipment for flat wire.

Worcester, Electrical Cable Works: Extension to building, additional equipment and rearranging old facilities to modernize plant and to increase capacity of electrical cable department.

Donora Steel Works: Improved cluder handling facilities in open-hearth department.

Donora Wire Works: Building and equipment to manufacture electric-welded concrete reinforcement.

American Sheet & Tin Plate Co.

Completed

Gary Works: Motor drive for finishing stand at No. 2 plate mill.

American Works: Three 685 w.t. boilers with stokers and auxiliary facilities.

Laughlin Works: New hot mill engine and drive.

Chester Works: Rebuilding hot mill furnaces Nos. 1 to 5 and equipping furnaces Nos. 1 to 8 with stoker equipment.

Under Way

Vandergrift Works: New pickling and galvanizing department buildings and equipment; new engines and drives for mills Nos. 1, and 2 and new furnaces for 8 hot mills.

American Bridge Co.

Completed

Pencoyd Works: Additional generating capacity for electric power.

Under Way

Pencoyd Works: New cranes and crane runway over charging floor and pouring side in open-hearth department.

Tennessee Coal, Iron & Railroad Co.

Completed

Ensley Works: Dry gas cleaner for blast furnace No. 3.

Fairfield Works: Additions to finishing end at bar and structural and plate mills and tie plate finishing department.

Pratt Mines: Opening and equipping No. 18 mine—Hamilton slope.

Under Way

Ensley Works: Rebuilding blast furnace No. 1 and 5000-kw. frequency changer at No. 1 power house.

Federal Shipbuilding Co.

Completed

10,000-ton capacity floating dry dock and auxiliary facilities.

Bethlehem Steel Corporation

The subsidiary companies of the Bethlehem Steel Corporation report the following improvements and additions completed in 1921 and under way at the close of the year at their various plants:

Bethlehem Plant, Bethlehem, Pa.

Completed in 1921: Ore and limestone bins and trestles for open hearth No. 2; converting machine shop No. 5 to a fabricating shop for light sections; machine for cutting herring bone gears; new gas blowers for exhaust house at coke plant.

Under Way: Centrifugal casting machine for brass foundry; extension to 28-in. billet mill building.

Steelton Plant, Steelton, Pa.

Completed in 1921: Generator set in power house; crane run-way for steam blowing engine building; service building at steel foundry.

Under Way: Fitting 35-in. mill manipulators with electric drive; installation of 6-ton electric furnace at steel foundry.

Lebanon Plant, Lebanon, Pa.

Completed in 1921: 300 kw motor generator set; additions and improvements at boiler house, one 10,000 kw. turbogenerator for power station; two roll turning lathes; factory warehouse and finishing department; one spike machine, seven drag furnaces, 15 automatic bolt threading machines; two machines for nut shop; two over-fired heat treating furnaces.

Under Way: Improvements and extensions to concentrating and sintering plant; cooper shop and galvanizing department; remodeling old nut warehouse building for store-room purposes; wire treating and pickling department; one special knuckle press for hexagon nuts; two thread rollers.

Maryland Plant, Sparrow's Point, Md.

Completed in 1921: One hundred houses and 100 bungalow type dwellings; aeration equipment for town water supply; five gas driven electric generators; extension to ore unloader; gas compressor and motor; 200 ft. extension to billet and sheet bar storage run-way at 40-in. blooming mill; dispensary and employment office at sheet and tin plate plant; stretcher leveler for sheet mills.

Under Way: Concrete anchorage and ties at coal handling dock; seven gas driven blowing engines; tracks at cinder dump; coal crusher for No. 2 open-hearth gas producers; coal crusher for 40-in. blooming mill gas producer; one roller leveler for sheet and tin plate mill.

Mining and Other Operations

The Bethlehem Chile Iron Mines Co., Chile, completed in 1921: Parts for electric power equipment; one light house complete and a new ore crusher and has under way improvements to basin dock and electric railroad.

The Bethlehem Cuba Iron Mines Co., Cuba, completed in 1921: Village improvements; equipment for power plant; one hundred ore cars; one 50-ton electric driven transfer car; one lighter; coal drying and pulverizing plant; concrete sub-structure for gantry run-way; aerial tramway; screening, recrushing and hoisting plant for ore at La Playa.

The Cornwall Ore Banks Co., Cornwall, Pa., completed in 1921: Plant for shaft sinking; one 300-ton electric revolving shovel and new railroad track for stripping and has under way equipment for open cut mining and one centrifugal pump.

Of the coal properties, the Preston Division, West Va., completed in 1921, houses and land for town; additional locomotives, pumps, mine cars and mining machinery; transmission line and feed wire for direct current, and has under way substation and motor barn; thirty 3-ton mine cars; additional tracks and trolley facilities for all mines; one 300 kw. power unit at mines Nos. 21, 24 and 27 and transmission line.

At the Marion Division, West Va., there was completed in 1921 twenty houses and community improvements at mine No. 41; fans and steam engine and motor at mine No. 11; and has under way one 15-ton locomotive at mine No. 41; 30 houses and locomotives, mine cars and pumps at mine No. 42.

At the Hellwood Division, Hellwood, Pa., there was completed in 1921 improvements to mine tippie at mine No. 6;

new mining equipment and tenement houses at mine No. 9; water barns and fire house at all mines; pumps, hoists and mining machines at all mines, and has under way additional mining machinery and transmission lines.

For ocean transportation, the corporation has under way: Three steel combination ore and oil steamers and two steel combination ore and coal steamers of about 20,000 dead weight tons each.

Midvale Steel & Ordnance Co.

The following work has been completed during the past year at the different plants of the Midvale Steel & Ordnance Co.:

Cambria Steel Co., Johnstown, Pa.: Coaling station for yard locomotives, 800-ton per day plant for sintering fine dust; hot metal ladies, trucks and tilting rigs at pig casting plant, also changes at Bessemer plant; two ore bridges for Hinckton Run ore yard; 51 gas producers, entire new equipment of gas valves, ore and limestone bins and sewer system for Franklin open-hearth department; retaining wall from Nos. 10 and 11 blast furnaces to Franklin open-hearth metal mixer; charging machine for Franklin open-hearth; four soaking pit furnaces at Franklin 40-in. blooming mill; eleven 60-in. Sellers turning machines for wheel plant; tube system for tests at Franklin open-hearth; relining stoves on No. 9 blast furnace; coke handling and conveying systems at Nos. 7, 8, 9, 10 and 11 blast furnaces; three 12,000-gal. quenching tanks, together with circulating pumps for Franklin coke plant; plant for the manufacture of the Henggi anti-rail creepers; new motor drives for 8-in. No. 3 and 9-in. No. 1 merchant mill.

Nicetown Works: Alteration of the No. 1 tire mill for rolling large rings, rearrangement and improvement to 8-in. and 12-in. rolling mill equipment and extension to the press plant building, 160 ft. by 172 ft.

Coatesville Works: A 22-in. skelp mill for the tube plant; electric worm driven screw down No. 2 plate mill and 10 steel gondola cars.

Union Coal & Coke Co.: Link belt rotary dumps for Hazelkirk mine; electrification of Hazelkirk and Acme mines; new hoists for Acme mine; two new pumps for Hazelkirk mine; reinstallation filtration plant at Marianna and the purchase of additional coal lands.

New work under construction for completion in 1922 is as follows:

Cambria Steel Co.: 148 coke ovens complete with by-product and light oil recovering apparatus and by-product plant for present coke ovens, together with benzol plant for all coke ovens; three hot stoves at No. 5 blast furnace; 16-in. water line from Gaultier to Franklin plant; two dry gas cleaners for Nos. 5 and 6 blast furnaces; relining No. 6 blast furnace; motor-driven shear at 14-in. mill; 8000-hp. modern boiler installation for Franklin plant; ore and limestone bins for blast furnaces Nos. 7, 8 and 9; replacement of entire Franklin open-hearth roof; extension of car shop to increase output of standard cars, and also for the manufacture of tank cars; toilets and lavatories at Nos. 7, 8 and 9 blast furnaces; relining Nos. 7 and 8 blast furnaces and three stoves; two wheel facing machines for wheel plant; replacing walls and roof of washery building at Franklin coke plant; new ore bridge at Franklin blast furnaces; fifth soaking pit furnace at Franklin 40-in. blooming mill; further electrification of rolling mill mine; rotary screen conveyor and bins at Carlin quarries; 300 steel mine cars for rolling mill mine; completing Nos. 5 and 6 mines at Rosedale; town-site and 89 houses adjoining Johnstown City; toilets, lavatory and locker facilities for Cambria plant and steel car department.

Coatesville Works: Waste heat boilers for open-hearth department; two coal-fired heating furnaces with waste heat boilers; roll lifting cylinder for No. 3 plate mill; low pressure water system at tube mill; coke dust screening and loading equipment at blast furnace; relining of No. 1 blast furnace; extension to scrap yard crane runway at tube mill and extension of three bays skelp mill yard.

Union Coal & Coke Co.: Development of new mine near Marianna; link belt rotary dump, new fan and mechanical screening arrangements at Acme mine.

Kansas City Bolt & Nut Co.

The Kansas City Bolt & Nut Co., Kansas City, Mo., reports that at the Sheffield steel mills the new steel plant addition was expected to be in complete operation before the end of 1921. Construction was started in August, 1919, and one 50-ton oil fired open-hearth furnace was lighted in October, 1920. The second furnace was completed and lighted in the spring of this year. Foundations are in for the third furnace, which will

mean an annual production of ingots amounting to 120,000 tons.

The 24-in. breaking down mill, reducing 10-in. x 10-in. ingots to billets, started in January, 1921, and has run continuously 8 hr. per day. At present only the first stand of this mill is operating. Three additional stands for finishing merchant bars and structural shapes have been installed, but the cooling bed has not been completed. A continuous heating furnace serving this mill is also oil-fired.

The finishing mills have just been completed. Billets are conveyed automatically from the 24-in. mill to a reheating furnace; from this furnace they enter a four-stand 12-in. Morgan continuous roughing mill, thence to a five-stand 10-in. merchant mill equipped with repeaters, and sizes 9/16 in. round and lighter will be repeated to a two-stand 8-in. Morgan high-speed finishing mill. Finished bars will be delivered from the 10-in. or 8-in. mill to an automatic cooling bed and conveyed from there to the shears and shipping department. These mills are all electrically driven and all buildings are equipped with overhead cranes.

This plant is separate from but operated in conjunction with the iron mills and bolt and nut department. The annual tonnage of finished product will depend largely on the degree of refinement, but will be approximately as follows: Merchant bars, concrete reinforcing bars and forging billets, 75,000 tons. The remainder will be made up of machine bolts and nuts; heat-treated track bolts and spikes; pull and sucker rods for the oil fields; special car forgings and galvanized pole line hardware.

In 1922 the cooling bed for the finishing end of the 24-in. mill will be completed, which will produce angles, channels and I-beams, and should the demand increase, space has been provided for two additional 50-ton open-hearth furnaces, making a total of five furnaces.

Inland Steel Co.

The Inland Steel Co., Chicago, practically completed in 1921 the following changes and additions:

250-ton powdered coal plant;
Railroad splice bar department;
Finishing department for 28-in. structural mill material, including three 10-ton and two 15-ton cranes;
Calcining plant for No. 1 (old open hearth plant);
Completion of changes in plate mill to 100 in. wide rolls, and additional housings, making a tandem mill and nearly doubling its capacity;
2 plate mill heating furnaces;
7 boilers, aggregating 7000 hp;
Additional cranes and shears for sheet mill operations.

For 1922 no new construction is planned except rail finishing, details of which have been already published. Although no additions have been made to the blast furnace or open-hearth capacity, the company states that the output of finished products will show an increase of about 33 1/3 per cent.

Worth Steel Co.

The Worth Steel Co., Claymont, Delaware, in August, 1921, put in operation its No. 2 plate mill having rolls 42 in. x 120 in. This new mill, together with the company's No. 1 mill, enables it to produce a complete line of plate sizes from 3/4 in. in thickness up to 4 in. or heavier and all widths up to 150 in. In January, 1921, the company lighted its No. 6 soaking pit and its No. 7 soaking pit in October, having previously started its No. 5 soaking pit in December, 1920. Pit No. 8 is practically finished and can be made ready to light at any time this year when business will warrant it. Stacks are also in position for No.'s 9 and 10 soaking pits and for No.'s 5, 6 and 7 open-hearth furnaces. These latter additions to the plant can be finished at any time when required within two or three months.

The first unit of the new Worth plant was completed and put in operation late in August and early in September, 1918, and consisted of one 3-high train of rolls 44 in. x 160 in., served by 4 soaking pits and also a steel plant having three 100-ton open-hearth furnaces and in 1920 the company enlarged its open-

hearth building so that it could install additional furnaces to double the original capacity; it also added to its rolling mill buildings so as to take care of No. 2 mill which was being built in 1920. Open-hearth furnace No. 4 was finished and lighted in July, 1920. The company also started building in 1920 an up-to-date flanging department which was put in operation in April, 1921.

Central Iron & Steel Co.

The Central Iron & Steel Co., Harrisburg, Pa., in 1921 rebuilt one open-hearth furnace, increasing its capacity from 50 to 90 tons. The open-hearth department now consists of one 50-ton and four 90-ton furnaces and work is in progress to enlarge the sixth furnace to 90-ton capacity.

Installations have also been completed for soda ash treatment of boiler water to a capacity of 600,000 gal. per 24 hr.

Central Steel Co.

The Central Steel Co., Massillon, Ohio, last year completed the erection of a 12-in. and an 18-in. merchant bar mill having a combined capacity of 18,000 tons per month. This company added a new finishing mill building, a new annealing department, pickling house and store room to its Massillon rolling mill plant. The sheet capacity of this unit was increased to 60,000 tons. To its National Pressed Steel plant it added a warehouse and an addition to the steel lumber mill building. A new mill for the cold rolling of steel lumber sections was installed and also a new furnace for heating slabs for the hot strip mill. The company's hot rolled strip steel capacity was increased to 90,000 tons per year, and its steel lumber capacity to 60,000 tons per year. A metal lath department was also added for the manufacture of diamond mesh lath.

Ashtabula Steel Co.

The Ashtabula Steel Co., Ashtabula, Ohio, which began the erection of a steel plant during 1920, slowed down on construction work last year because of general business conditions, but this plant is approaching completion. The company, however, does not expect to begin operations before late in the Spring. The plant will have 5 roughing stands, 8 sheet mills and 2 stands of cold rolls, all driven by a 1600-hp. engine, 8 combination sheet and pair furnaces, 6 sets of shears, a double continuous annealing furnace, 2 galvanizing pots and a corrugating machine. Powdered coal will be used exclusively for firing the boilers and furnaces.

Otis Steel Co.

The Otis Steel Co., Cleveland, last year completed and placed in operation a new sheet mill plant as a part of its Riverside Works. This plant contains 8 roughing and 8 finishing mills, 8 double sheet and 8 pair furnaces fired with powdered coal, 6 cold rolls, 2 pickling machines, 6 bar annealing furnaces and 1 galvanizing pot. The plant has an annual capacity of 60,000 tons of sheets in all finishes.

United Alloy Steel Corporation

The United Alloy Steel Corporation, Canton, Ohio, completed the installation and placed in operation, last year, a 12-in. 2-high continuous Morgan bar mill consisting of two 18-in. and four 16-in. roughing stands and 4 finishing stands. The equipment includes 2 Morgan gravity discharge heating furnaces and a double Morgan combination inclined gravity and horizontal type cooling bed. The mill is driven by a 3000-hp. adjustable speed motor. The rolling capacity of the mill is 120,000 tons per annum. It is designed particularly for alloy steel.

Mansfield Sheet & Tin Plate Co.

The Mansfield Sheet & Tin Plate Co., Mansfield, Ohio, has under construction four 80-ton open-hearth furnaces, a 32-in. three-high blooming mill and a 24-in. sheet bar mill which are expected to be ready for operation early this year.

Trumbull Steel Co.

The Trumbull Steel Co., Warren, Ohio, last year increased the capacity of its strip steel department by the completion of a 9-in. strip mill which was placed in operation about May 1 and is erecting a 14-in. strip mill which will be ready for operation in the Spring.

Republic Iron & Steel Co.

The Republic Iron & Steel Co., Youngstown, Ohio, completed and put in operation in 1921 the eight new sheet mills which it built at Niles, Ohio. This is the only new capacity added last year and there are no plans for additional new capacity for 1922.

John A. Roebling's Sons Co.

John A. Roebling's Sons Co., Trenton, N. J., in 1921 added to its equipment new wire rope making machinery as required to properly balance methods of manufacture, increased rope wire drawing capacity and equipment to reduce cost of handling materials. The company has under construction a new shop for the electro-galvanizing of wire which will materially increase present capacity and which is expected to be in operation early this year.

Follansbee Brothers Co.

Follansbee Brothers Co., Pittsburgh, will have ready for operation early in January its new mill at Toronto, Ohio, built especially for the manufacture of sheet steel. This plant will have four 40-ton open-hearth furnaces and 10 hot mills, with the necessary cold rolling and finishing departments.

Utah Steel Corporation

The Utah Steel Corporation in 1921 installed a continuous billet heating furnace, designed by Arthur G. McKee & Co., replacing two coal-fired, hand-operated, 4-door heating furnaces. The new furnace is equipped to burn either producer gas or oil. It also installed a 5-ton Barber-Foster overhead traveling crane to serve this furnace from the billet dock. Also there was installed a large oil storage tank, oil-burning equipment for open-hearth furnaces, as well as for the ingot and billet heating furnaces. It is now possible to use either fuel oil or producer gas as may be most economical at the time.

"This year," says the company, "we increased our capitalization to \$5,000,000 and are now financing for the construction of a 400-ton blast furnace, the installation of sheet mills and a galvanizing department, with capacity for the manufacture of 50,000 tons per annum of blue annealed, black and galvanized sheets and light plate. We expect to start construction work on both the sheet mills and the blast furnace early in the spring. Our construction program also contemplates the addition of three stands of rolls to our present 22-in. mill, and the installation of a 1500-hp. motor to drive it in place of the present steam engine drive. This mill will be used for the manufacture of sheet bar as well as finished bar products."

Gulf States Steel Co.

The Gulf States Steel Co., Birmingham, Ala., in 1921 completed the installation of two 2000-kw. alternating current, low-pressure turbogenerating units, driven by the exhaust steam from the company's rod mill engines. During 1921 the company has also completed the slope at its Shannon ore mine, together with all outside and inside equipment, and its mine is now in regular operation producing all the ore necessary for the company's blast furnace.

Universal Steel Co.

The Universal Steel Co., Bridgeville, Pa., is installing and expects to have ready for operation early in 1922 the following equipment:

- One—1000-ton high-speed forging press and boiler plant equipment.
- One—5-stand 14-in. 3-high bar mill.
- One—5-stand 10-in. 3-high guide mill.
- One—3-stand 8-in. 3-high guide mill.

The above mills are to be complete, with all accessories and motors to drive them. A complete and modern laboratory building is also under erection as well as a new pumping and filtering plant to serve the foregoing new equipment.

Apollo Steel Co.

The Apollo Steel Co., Apollo, Pa., completed in 1921 the construction of four sheet mills and two 2-high jobbing mills, during the latter part of the year. These new mills will be put into operation as soon as market conditions justify.

Harrisburg Pipe & Pipe Bending Co.

The Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa., has under construction a new 10-in. guide mill which will be completed about Jan. 15. It is designed to roll rounds, flats, squares and shapes of both ordinary carbon and alloy steels.

Heppenstall Forge & Knife Co.

The Heppenstall Forge & Knife Co., Pittsburgh, Pa., completed in 1921 the installation of oil storage tanks of approximately 200,000-gal. capacity and remodeled 15 heating furnaces in its forging department, changing the fuel from coal to oil.

At its Bridgeport, Conn., plant it is now remodeling four furnaces, changing the fuel from coal to oil, and has installed oil storage capacity of 50,000 gal.

Other Steel Works Additions

The National Enameling & Stamping Co., Granite City, Ill., in 1921 completed the installation of a 24-in. bar mill for sheet bars, having a capacity of 1200 tons per day.

The Judson Mfg. Co., Emeryville, Cal., in 1921 installed continuous furnaces and long hot beds and plans in 1922 to install double-end oil furnaces. It is expected that the annual rolling mill production of the company for 1922 will be about 90,000 tons.

The Adamson Machine Co., Akron, Ohio, in 1921 completed an extension to its power house having a floor area of approximately 1000 sq. ft.

The Washburn Wire Co., Phillipsdale, R. I., had under way the modernizing of its blooming mill.

The West Leechburg Steel Co., Pittsburgh, Pa., expects to install in 1922 a new 16-in. electrically driven continuous strip mill together with the necessary auxiliary equipment, including pickling department and warehouse.

The Jones & Laughlin Steel Co., Pittsburgh, at its Soho Works installed in 1921 a 32-in. universal mill, furnished by the Mackintosh-Hemphill Co.

NEW ROLLING MILL WORK *

Installations of new rolling mill capacity during 1921 and that planned for 1922 are as follows:

Calumet Steel Co.

The Calumet Steel Co., Chicago Heights, Ill., placed in operation in 1921 new motor driving equipment for its mills. Its two 14-in. mills are operated by two 1000-hp. variable speed, Kraemer type motors installed by the Westinghouse Electric & Mfg. Co. Its 8-in. mill has been equipped with 500 hp. constant speed motor.

Eddystone Steel Co.

The Eddystone Steel Co., Crum Lynne, Pa., added to its plant during 1921 the following:

A 60-in. 3-high plate mill, for rolling plates up to 50 in. wide and down to No. 16 gage.

A continuous blue annealing furnace, for production of blue annealed steel sheets from No. 8 gage down to No. 16 gage and up to as wide as 48 in.

It is planned to install a 72-in. 3-high plate mill during 1922, or as soon as business conditions revive.

These two mills will give the company a capacity of about 25,000 tons of open-hearth steel plates and blue annealed steel sheets per year.

Hudson City Steel Corporation

The Hudson City Steel Corporation, with offices in the Woolworth Building, New York, expects to build in 1922 a new cold rolled strip mill near Beacon, N. Y. This will consist of:

Ten mills in the form of two tandems or four mills each 10 in. x 12 in. and 12 in. x 14 in. respectively.

Two finishing mills, 10 in. x 12 in. and 12 in. x 14 in. respectively.

Two slitters and two straight and cut machines.

Two electric annealing furnaces and necessary equipment required for the annealing and pickling departments, together with necessary equipment for machine shop and blacksmith shop.

Indiana Rolling Mill Co.

The Indiana Rolling Mill Co., New Castle, Ind., in 1921 completed the installation of a new 28-in. sheet mill of three stands; in connection with this there was also installed a new Corliss engine and a new furnace for re-heating slabs. A new office building, two stories, with a basement, is also nearing completion.

Electric Steel & Forge Co.

The Electric Steel & Forge Co., Cleveland, last year completed and placed in operation a 12-in. rolling mill for the manufacture of hot rolled tool steel and special alloy and carbon steel bars and billets. The equipment includes three oil-fired heating furnaces.

Other New Rolling Mill Work

The Parkesburg Iron Co., Parkesburg, Pa., in 1921 besides making thorough repairs replaced five boilers with new ones in its power plant.

The Fort Dodge Culvert & Iron Mills Co., Fort Dodge, Iowa, expects to add in 1922, a 16-in. breakdown mill.

The Milwaukee Rolling Mill Co., Milwaukee, Wis., completed early in 1921, its new sheet plant which was fully described in THE IRON AGE, June 23, 1921.

The Empire Rolling Mill Co., Cleveland, last year installed a 1-pot galvanizing plant.

Additions to Foundries

The Pittsburgh Rolls Corporation, Pittsburgh, in 1921 completed a new roll shop, 295 x 65 ft., for the production of large size rolls. It is equipped with two 50-ton electric driven cranes as well as a number of new lathes and machinery which are also electrically driven. Fuel oil storage tanks, having a capacity of 250,000 gallons, have also been built.

The Ohio Steel Foundry Co., Lima, Ohio, last year put in two large sand handling units, consisting of reciprocating and belt conveyors with elevators and sand conditioning equipment, doubling the company's molding capacity. In 1922, the company expects to build an additional open-hearth furnace doubling the steel producing capacity.

The Adirondack Steel Foundries Corporation, Watervliet, N. Y., in 1921 completed the installation of a 25-ton open-hearth basic furnace.

The National Steel Foundries, Milwaukee, Wis., completed in 1921 the installation of two 252 ton tilting open-hearth furnaces. These, as well as features of the plant, were described in THE IRON AGE, Oct. 20, 1921.

Blast Furnace Work

The Trumbull Cliffs Furnace Co., Warren, Ohio, last year completed a 600-ton blast furnace which will supply pig iron for the Trumbull Steel Co., with which the furnace company is allied. The stack is 92 ft. high and 22 ft., 6 in. in diameter at the bosh. The plant includes a pig casting machine and combined ladle and pouring house. A description of this plant appeared in the Sept. 15, 1921, issue of THE IRON AGE.

The Hamilton Furnace Co., Hamilton, Ohio, has nearly completed a new 450-ton blast furnace for producing basic, malleable and foundry iron. Its dimensions are 90 ft. high with a bosh diameter of 20 ft. Its rated capacity is 175,000 tons per year.

E. W. Mudge & Co., Sharpsville, Pa., has under construction for completion in 1922 a 500-ton blast furnace to be known as Claire No. 1. It replaces, on a new foundation, the old smaller Claire furnace. It is 87 ft. high with a bosh diameter of 19.6 ft. The furnace was started in June, 1920, the old furnace operating 288 days of that year. This was dismantled in 1921 and some of the usable parts incorporated in the new furnace. The new furnace is completed all but lining and it is expected that this will be accomplished in 1922.

The United States Steel Corporation as well as the Bethlehem Steel Corporation and the Midvale Steel & Ordnance Co. are rebuilding several blast furnaces, in some cases increasing their capacity.

Blast furnace No. 2 of the LaBelle Iron Works of the Wheeling Steel Corporation, Steubenville, Ohio, was remodeled in 1921. The Martins Ferry furnace of the same corporation at Martins Ferry, Ohio, is being remodeled as is also the Standish furnace of the Chateaugay Ore & Iron Co., Standish, N. Y.

Puddlers' Wages Reduced

YOUNGSTOWN, OHIO, Jan. 3.—Average sales of bar iron shipped during the 60-day period preceding Dec. 20 by mid-Western independent mills affiliated with the Western Bar Iron Association were on a basis of 1.65c. per lb., as compared with a 1.70c. average two months earlier. This was disclosed at the bi-monthly examination of sales sheets to determine the puddling rate for the January-February period. Puddlers' rate will be reduced to \$8.22 for the first two months of the year, from \$8.43, the rate paid during November and December, while finishing hands will be cut two per cent, as a result of the settlement.

The new puddling rate compares with a peak in 1920 of \$18.76 per ton, paid when bar iron was selling at an average of 3.50c. per lb. During the year there has been a progressive decline at each bi-monthly settlement in the average bar iron price and consequently in the tonnage rates.

January-February shipments this year were on an average of 2.80c.; March-April, 2.55c.; May-June, 2.30c.; July-August, 1.85c.; September-October, 1.70c. and November-December, 1.65c. This averages 2.14c. per lb. for the year and current prices are therefore substantially below the average.

Settlement in the sheet and tin plate divisions will be conducted about Jan. 10. Wages in these divisions for November and December were based upon an average selling price of 2.75c. for Nos. 26, 27 and 28 gage black sheets, and \$5 for tin plate per base box, disclosed two months ago. In the meantime, there has been a definite decline in tin plate to \$4.75 per base box, shortly after the last examination, and tin mill workers will therefore receive a moderate reduction.

Foundrymen and Stove Molders Agree

After a conference lasting three weeks, representatives of the Stove Foundrymen's National Defense Association and the International Molders' Union of North America came to an agreement regarding the wages to be paid in the stove industry during the year 1922. The agreement provides that beginning Jan. 1, 1922, there will be a reduction of 10 per cent on all work, and in addition a 5 per cent reduction is to be made on board prices on some branches of furnace and steel and hot water work. The reduction on board prices on furnace, steel and hot water work was made to maintain a uniform percentage on all work in the shop. The minimum wage for day workers during 1922 will be the same as that effective during 1921; the rate being \$6 for eight hours work. No other changes were made in the conference agreement. The agreement was in the nature of a compromise, the Stove Foundrymen's Association demanding that where board prices had been arbitrarily raised since January, 1918, these prices be reduced to the 1918 board prices. In addition to this, the association demanded a 20 per cent reduction on stove plates and a 30 per cent reduction on furnaces, cores, hot water and all other work.

Iron and Steel Markets

NEW CAR ORDERS

More Than 25,000 Placed and Pending

December Pig Iron Output Beyond Expectations—Steel Prices Favor Buyers

The steel trade enters upon the new year in a spirit of qualified hopefulness. It expects 1922 to be better than 1921. The fact is emphasized that the country has been swept bare of steel and that consumers, having used up considerably more material in 1921 than the mills shipped them, now have the mills as their sole dependence. While capacity will continue well in excess of demand, a 60 per cent operation at some time in the new year is not considered too much to expect.

Nineteen twenty-one goes down in the records as a 38 per cent year in steel. Ingot production probably exceeded 19¼ million tons, against 40,881,000 tons in 1920.

The immediate future of demand and prices is not clear. Steel producers have ceased to predict large railroad buying, but as it amounted to only about 15 per cent of the total in 1920 and less than that percentage in 1921 they feel safe in counting on better things in 1922.

Chicago reports give encouragement as to car orders. About 25,000 freight cars are expected to be placed in that district early in the year, whereas for the whole country 1921 yielded only 20,000. The Burlington will probably close for 7300 cars this week and the Illinois Central will take early action on 2200. The Seaboard Air Line, besides buying 25 locomotives, has placed 2000 to 2500 cars with the Fairfield, Ala., plant. For the Norfolk & Western 4000 cars are under negotiation. The Union Pacific has increased its recent inquiry for 1500 freight cars to 5500.

Rail buying is not on the scale of a year ago. Upwards of 400,000 tons are under contract for 1922 and the Pennsylvania order is an early prospect.

After the holiday shutdowns of the larger steel companies operations are somewhat larger, the Steel Corporation running this week at somewhat more than 45 per cent. For independent companies the average is probably nearer one-third.

Holiday bankings of blast furnaces amounted to much less than was looked for. Production in December was 1,649,086 tons, or 53,196 tons per day, as compared with 1,415,481 tons in November, or 47,183 tons per day. The daily increase was about 6000 tons, or 13 per cent.

Six furnaces blew in last month and one blew out, the number active on Jan. 1 being 125, against 120 one month previous.

Pig iron sales have been very light and no inquiries of importance have developed. Southern pig iron has receded another 50c. to \$16.50, Birmingham, and malleable has been marked down 50c. in the Pittsburgh district.

Reports of pending reductions in plate, shape and bar prices by a leading producer have been strongly denied. The 1.50c. basis on these products is that which commonly prevails on contracts made to cover definite work, but exceptions are well marked.

New fabricated steel projects, including some large investment enterprises, total close to 14,000 tons, and the week's awards amount to about half as much. The New York Central has put out an inquiry for its first quarter needs, upward of 6000 tons, including 500 tons of billets, 3000 tons of bars, plates and shapes, 750 tons of nails and staples, 600 tons of sheets, 3000 tires and 5000 car axles, with other miscellaneous items, such as boiler tubes, frogs and switches.

Industrial building is rare, but 5000 tons has been placed at Pittsburgh—3000 tons for a new rod and wire plant of the Wheeling Steel Corporation at Portsmouth, Ohio, and 2000 tons for new Steubenville, Ohio, works of the same company.

New iron and steel capacity under construction at the beginning of 1922 is the smallest in many years. Only 6 open-hearth furnaces are planned for 1922, with an annual capacity estimated at 217,500 gross tons, and only two blast furnaces, with a capacity of 310,000 tons. Last year only 8 new open-hearth furnaces and one Bessemer converter were added, with 247,500 tons annual capacity, and one blast furnace, capacity 180,000 tons. The blast furnace capacity completed last year or under way is the smallest in 27 years.

Pittsburgh

PITTSBURGH, Jan. 3.

Seasonal quiet rules in the iron and steel market, but there also is a pretty general sentiment that before the new year is far advanced business will be materially better, as stocks of iron and steel in consuming and distributing quarters are believed to be extremely moderate. At the same time, there is no indication of an immediate abandonment on the part of buyers of their recent policy of purchasing close to actual needs. While it is contended that present prices completely discount freight rate reductions and wage adjustments among certain kinds of labor, which up to date have not been affected in the general liquidation of the past year, buyers are not convinced that when these things are actually accomplished still lower prices will not be seen. The forecast finding the most general acceptance is that orders carrying early shipment instructions will be numerous enough during the first quarter of the year, but that there will not be a great deal of contracting or anticipatory buying before summer.

There has not yet been much change in the opera-

Composite Price, Jan. 3, 1922, Finished Steel, 2.062c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets	Dec. 27, 1921, 2.062c. Dec. 6, 1921, 2.135c. Jan. 4, 1921, 3.057c. 10-year pre-war average, 1.684c.
These products constitute 88 per cent of the United States output of finished steel.	

Composite Price, Jan. 3, 1922, Pig Iron, \$18.60 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Dec. 27, 1921, \$18.68 Dec. 6, 1921, 19.47 Jan. 4, 1921, 31.97 10-year pre-war average, 15.72
---	--

tions of steel plants in this and nearby districts, following the holiday interruption. Prices do not change much, but if there is a definite tendency, it is in favor of buyers. No shading of sheet prices yet has developed, but there still is considerable uncertainty as to prices of most of the other finished products. This is particularly true of the heavier lines, although a report that the Steel Corporation soon would announce lower prices of plates, shapes and bars is strongly denied. The Dec. 15 reduction in steel pipe prices is reported to have frightened buyers to some extent, and fear also is expressed as to the effect of a reduction of 50c. per barrel in the price of Pennsylvania crude oil upon the immediate demand for oil country goods. Manufacturers of wire products, in contradiction to reports, said to have emanated from purchasing agencies, declare that the Dec. 21 prices are not being shaded.

The pig iron market shows very little life and light steel plant and foundry operations find full reflection in the demand for scrap iron and steel. The coke market has been enlivened by the consummation of a number of contracts for furnace coke for January, first quarter and first half delivery. About 800,000 tons are in-

volved, a feature of the business being that almost half will be supplied from by-product grade.

Pig Iron.—Both inquiries and sales have been few and small in the past week. Sales of more than a carload are unusual and producers find difficulty in interesting melters in their future requirements, even by giving intimations of a willingness to accept concessions from current quotations. Follansbee Brothers Co. again is seeking 1000 tons of basic, but this company is able to get iron at a source near its plant for so much less than prices quoted by western Pennsylvania and Valley furnace interests that the latter have little chance to secure the business. Such lots of foundry iron as have lately been moved have been at \$19.50 to \$20, Valley furnace, for No. 2 grade. There has been no business to support a change in basic iron from \$18.25, Valley furnace, and Bessemer still is quoted at \$20, although this price would be shaded as much as 50c. per ton on an order involving a round tonnage. Malleable iron still is held by some makers at \$20, but the best bid recently made has been \$19.50. Sales of iron from Valley furnaces for December, as compiled by W. P. Snyder & Co., Pittsburgh, show \$18.6875

for basic and \$20 for Bessemer, as compared with \$19 and \$20, respectively, in November.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$18.25
Bessemer	20.00
Gray forgo	\$18.00 to 19.50
No. 2 foundry	19.50 to 20.00
No. 3 foundry	19.00 to 19.50
Malleable	19.50 to 20.00

Ferroalloys.—Small lot sales for early delivery are fairly common in ferromanganese and 50 per cent ferrosilicon, but as a general rule at prices which are nearer buyers' than sellers' valuations. The quotation of the local producer of ferromanganese still is \$60, Pittsburgh, but it is reported that on some recent transactions a price as low as \$59, Pittsburgh, has been accepted. This interest is rather more aggressive for business than it was a short time ago, the explanation being that it has some high-priced ores which it is anxious to liquidate. Meanwhile, other domestic makers are holding to \$58.35, Atlantic seaboard, for 78 to 82 per cent material, this price also being quoted for the same grade of material by English producers. That price, however, means a delivered cost at Pittsburgh common freight points, well above that of the local producer, who naturally is getting the bulk of the business. Most of the recent business in 50 per cent ferrosilicon has been supplied from a tonnage sold to middlemen some time ago by a Niagara Falls maker at low prices. As low as \$54, delivered, has been done on some of this material and this makes it difficult for makers seeking higher prices to secure orders. It is believed, however, that most of this tonnage now has passed into consumers' hands and there are expectations of a firmer market before long. A central Ohio steel company recently inquired for 300 tons of 16 to 19 per cent spiegel-eisen, bids against which ranged from \$28.50 to \$32, delivered. Practically no 20 per cent spiegel-eisen now is available, as there has been little production during the year by commercial producers, and stocks have been pretty well liquidated.

We quote 78 to 82 per cent domestic ferromanganese at \$59 to \$63.67 delivered; 78 to 82 per cent foreign ferromanganese, \$58.35, c.i.f. Atlantic seaboard; German, for 76 to 80 per cent, \$54, seaboard. Average 20 per cent spiegel-eisen at \$30 delivered, Pittsburgh or Valleys; 16 to 18 per cent spiegel-eisen, \$26 to \$30 delivered Pittsburgh; 50 per cent ferrosilicon, domestic, \$54 to \$57, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$38.50; 11 per cent, \$41.80; 12 per cent, \$45.10; 13 per cent, \$49.10; 14 per cent, \$54.10; silvery iron, 6 per cent, \$27; 7 per cent, \$28; 8 per cent, \$29.50; 9 per cent, \$31.50; 10 per cent, \$33.50; 11 per cent, \$36; 12 per cent, \$38.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—Interest in the market is low and with sales few and small quotations largely are appraisals of what might be done. It is patent that \$29 is as high as can be done on 4-in. billets, and that if a fair-sized tonnage was offered, it could be placed at \$28. On sheet bars and slabs, makers are asking \$30, but \$29 is more representative of to-day's possibilities.

We quote 4 x 4 in. soft Bessemer and open-hearth billets at \$29 to \$30; 2 x 2 in. billets, \$29 to \$30; Bessemer and open-hearth sheet bars, \$30; slabs, \$29 to \$30; forging billets, ordinary carbons, \$32 to \$33, all f.o.b. Youngstown or Pittsburgh mills.

Nuts and Bolts.—Makers here have experienced no appreciable increase in business, and the common expectation is that trading will continue irregular and unsatisfactory until the year has further progressed and fundamental conditions have been corrected to a point where buyers will feel safe in anticipating their needs. That stocks are light in second hands is evident from the fact that there is considerable eagerness on the part of buyers to secure prompt shipments. There is somewhat better observance of quoted discounts than was the case recently. Discounts are given on page 128. Instead of arbitrary and individual extras for oversize tapping of nuts, a majority of makers now are quoting 2c. per lb. extra for tapping 1/32-in. outside of United States standards for hot pressed and cold punched, in sizes 9/16-in. and smaller and 1c. per lb. extra for sizes 5/8-in. and larger.

Wire Rods.—Some makers are experiencing a fairly good business in small lots with some export sales included in recent transactions. The public quotation still is \$38 for the base size of soft rods, but it is ad-

mitted that this price is largely a negotiation quotation and that actual sales have been done at \$1 to \$2 per ton less. Prices are given on page 128.

Structural Material.—The past week has been featured by at least two good-sized awards, these being the new rod and wire plant of the Wheeling Steel Corporation at Portsmouth, Ohio, taking 3000 tons, and several mill buildings and crane runways for the Steubenville, Ohio, works of the same company, involving 2000 tons. Both orders went to the McClintic-Marshall Co., which also has taken the contract for an extension to the refinery building and the new calcining building for the International Nickel Co., Huntington, W. Va., the two jobs taking 500 tons. This company also will fabricate steel for North Pier No. 3 for the Frederick Snare Corporation, New York, taking 175 tons; a 5-story storage building at Harrisburg placed through the Hughes-Foulkrod Co., Pittsburgh, requiring 285 tons; and a 7-span bridge for the Chicago, Burlington & Quincy Railway Co., Chicago, taking 325 tons. The market on plain material holds fairly steady with the bulk of the business moving at 1.50c. Prices are given on page 128.

Spikes and Track Bolts.—Demands still are few and small and prices rather unsteady. Large spikes are quoted at \$2.25 base per 100-lb., but there has been some recent business as low as \$2.20 and like concessions are appearing in small spikes, on which the regular or public quotation is \$2.40 base per 100-lb. Track bolts have eased off about \$5 per ton with carload lots available at from \$3.25 base per 100 lb. and even as low as \$3. Prices are given on page 128.

Plates.—The market here is extremely narrow, for the reason that consumers being served from other centers have something of an advantage on local tank builders and fabricating interests, in the matter of delivered prices. It is claimed that some business is being taken at 1.60c., but the more common price is 1.50c., on other than retail quantities.

We quote sheared plates, 1/4 in. and heavier, tank quality, at 1.50c. f.o.b. Pittsburgh.

Cold-Finished Steel Bars and Shafting.—There is no special change in the general situation, buyers still being inclined to order sparingly and then only for supplies to round out depleted lines. It is believed that stocks in consumers' hands are pretty well liquidated, and that if there are no really large orders in the near future, at least demands will be more numerous than they have been in the past 60 to 90 days. Prices take an unusually wide range. On what are regarded as desirable tonnages, as low as 1.90c., and even 1.85c., has been done, but on the bulk of such business as has come out 2c. is minimum and some business actually has been entered as high as 2.25c. where the order has been rather difficult of execution. Ground shafting is unchanged at \$2.50 base per 100-lb. f.o.b. mill.

Steel Skelp.—The market is inactive but fairly steady at 1.50c. There is a little export business, but this is not especially desirable since it means taking less than 1.50c.

Iron and Steel Bars.—The market on steel bars has pretty definitely settled to 1.50c., Pittsburgh, although the claim is made that 1.60c. prevails on some business. Demand is for small lots for immediate delivery. Activity also is lacking in iron bars, which are quotable on sales at 2c. to 2.10c., although the asking price of most makers is 2.15c., base.

We quote steel bars rolled from billets at 1.50c.; reinforcing bars, rolled from billets, 1.45c. to 1.50c., base; reinforcing bars, rolled from old rails, 1.40c. to 1.45c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Rivets.—Demand still is entirely hand-to-mouth and there is little indication of an early departure from this policy. Makers insist that present prices more than discount the decline in rods and bars, but in spite of that fact there is more or less shading of quotations chiefly by those not recognized as regular makers of rivets. Companies making a full line of rivets are quoting \$2.40 base per 100-lb. for large structural and ship rivets and \$2.50 per 100-lb. for large boiler rivets. Competition, however, has resulted in prices from \$3 to \$5 per ton below those figures. Prices and discounts are given on page 128.

Coke and Coal.—The last week of the old year saw the conclusion of negotiations for furnace coke contracts involving a total tonnage of approximately 300,000. The Sharon Steel Hoop Co., Sharon, Pa., which has been operating its furnace at Lowellville, Ohio, for the past six months on by-product coke, for the next six months, will use beehive oven fuel; this contract is for six months and calls for a total of about 70,000 tons. The coke for the new Trumbull-Cliffs furnace, Warren, Ohio, which goes into blast Jan. 15, will be supplied by the Youngstown Sheet & Tube Co., the contract to run from Jan. 15, to July 1, and to involve 90,000 tons. The Youngstown Sheet & Tube Co. also has taken the contract for 10,000 tons a month for the first three months of the year for the Shenango Furnace Co., Sharpsville, Pa., and will furnish 14,000 tons a month for February and March, for the furnace of the A. M. Byers Co., Girard, Ohio. A Connellsville district producer, now supplying the Adrian furnace, DuBois, Pa., will continue to supply the requirements of that furnace for the first three months of this year, which amount to 9000 tons a month. The Colonial Iron Co., Riddlesburg, Pa., has closed for the first quarter with a Connellsville producer, this contract calling for 8000 tons a month. Several contracts for January shipment also have been closed, one of these being for 10,000 tons and another for 6000 for Eastern furnaces. The business has definitely established the contract market on first quarter tonnages of beehive oven furnace fuel at from \$3 to \$3.25 per net ton ovens, or 25c. per ton below what producers asked at the outset of negotiations a few weeks ago. Spot foundry coke is quotable about \$1 per ton above furnace grade.

Iron and Steel Pipe.—Slowing down in the demand incident to the end of the year seems to have been accentuated by the most recent reduction in prices, and since to-day brought the announcement of a reduction of 50c. per barrel in the price of Pennsylvania crude oil, the first reaction since the market turned upward several months ago, there is some apprehension about early orders for oil country goods. Most makers have accumulated a fair amount of business, however, and mill operations still are relatively high. Discounts are given on page 128.

Hoops and Bands.—Activities still are limited, probably because of the uncertainties which exist as to prices. The common quotation on hoops is 2c., base Pittsburgh, and so far the effort to obtain a lower price has not been successful, although the contention of buyers that a spread of \$10 per ton between the present base prices of steel bars and hoops is too wide is not disputed. The asking price on bands also is 2c., but business at this price has been difficult to obtain, because buyers claim to have quotations as low as 1.75c. If such quotation has been made, it is believed to have come from manufacturers having bar mills and who have based the price on bars plus the old card differential of 25c. per 100 lb. for bands.

Hot-Rolled and Cold-Rolled Strips.—Effective Jan. 1, the American Steel & Wire Co. named a price of 3.50c., base Pittsburgh, for cold-rolled strips, and this price is being met by independents, although a few still are asking 3.75c. There is no change in hot-rolled strips, which still are quoted anywhere from 2c. for the more desirable tonnages, up to 2.25c. for those more difficult of execution.

Wire Products.—Widespread circulation of reports that the Dec. 21 prices were not being strictly adhered to and that concessions of 10c. to 15c. per keg were being made to large buyers of nails, although stoutly denied by leading manufacturers, have tended to intensify the dullness usual to this time of year. Important manufacturers here insist that there has been no shading of the \$2.50 base per keg for bright nails nor \$2.25 base per 100 lb. for plain wire.

We quote wire nails at \$2.50 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Steel Rails.—Demand for light rails is extremely limited, as usual at this time of the year. Demands

from contractors are small and the coal companies seem to have long since provided against their winter requirements. These rails rolled from new steel commonly are quoted at 1.60c., but this price is being obtained only for small lots and a price of 1.55c. is not hard to obtain. Practically all orders for standard rails call for delivery during first six months. Ordinarily contracts run for the full year. Evidently the railroads are expecting further price concessions.

We quote 25 to 45-lb. sections, rolled from new steel, 1.55c. to 1.60c. base; rolled from old rails, 1.50c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Tin Plate.—New orders continue few, but container manufacturers are specifying freely and shipments are showing up unusually well for this time of the year. The situation in canned foods is much more favorable than it was at the beginning of 1921, for in contrast with that time stocks are reported to be very light in distributors' hands. The packers have rather big stocks, but their position in this respect is better than it was a few months ago. There is good observance of the regular quotation of \$4.75 per base box on standard coke tin plate. On export business prices are somewhat firmer than they were a short time ago, due to the fact that competition from Welsh makers is not as sharp as it has been.

We quote standard production coke tin plate at \$4.75 per base box F.o.b. Pittsburgh for carload lots.

Sheets.—Independent mill operations are low again this week, as a number which shut down for the holidays have not yet accumulated enough business to start up. The American Sheet & Tin Plate Co. is running about 65 per cent, largely because of the receipt of some rather sizable orders for light gage sheets for shipment to Japan. Prices are given on page 128.

Old Material.—The market is inactive as far as purchases by melters are concerned, but maintains a very firm tone because of light available supplies and the expectation that before the month ends there will be an increase in steel works operations and consequently in consumption. Already some dealers have received releases against suspended shipments and during the past few days several of the steel companies have been feeling the market out. Heavy melting steel cannot be bought for less than \$14.50, delivered, and sales at that price usually refer to single carloads which the owners are obliged to move promptly. On round tonnages, \$15 is the real minimum, and stocks in dealers' yards are not available at less than \$16. The market is dull and nominal on foundry grades and on those kinds of material going to special uses. The Baltimore & Ohio Railroad will receive bids until noon, Jan. 9, for 17 cars and 9660 gross tons of scrap; also for 300 lb. of high speed steel. The Pennsylvania Railroad, Central Region, list, on which bids will close Jan. 5, offers 12,862 net tons and the Eastern Region list, bids on which close to-morrow, offers approximately 20,000 net tons, including 5000 tons of rails.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$14.50 to \$15.00
No. 1 cast, cupola size.....	16.25 to 16.75
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.50 to 16.00
Compressed sheet steel.....	12.00 to 12.50
Bundled sheets, sides and ends.....	10.50 to 11.00
Railroad knuckles and couplers.....	15.00 to 15.50
Railroad coil and leaf springs.....	15.00 to 15.50
Low phosphorus standard bloom and billet ends.....	18.00 to 18.50
Low phosphorus plates and other grades.....	17.00 to 17.50
Railroad malleable.....	13.00 to 13.50
Iron car axles.....	24.00 to 25.00
Locomotive axles, steel.....	22.00 to 23.00
Steel car axles.....	15.50 to 16.00
Cast iron wheels.....	15.00 to 15.50
Roller steel wheels.....	15.00 to 15.50
Machine shop turnings.....	9.00 to 9.50
Sheet bar crop ends.....	14.50 to 15.00
Heavy steel axle turnings.....	11.00 to 11.50
Short shoveling turnings.....	10.00 to 10.50
Heavy breakable cast.....	14.00 to 14.50
Stove plate.....	13.00 to 13.50
Cast iron borings.....	10.00 to 10.50
No. 1 railroad wrought.....	11.50 to 12.00

Chicago

CHICAGO, Jan. 3.

December bookings of an important local mill were larger than those of any month since April. Much of the tonnage taken was traceable directly or indirectly to the railroads and oil fields. Considerable additional business is expected from the same sources, as both car builders and tank fabricators are figuring on large inquiries which are expected to be closed soon. A number of rail orders also will probably be placed soon, although it is notable that rail buying is not on the scale of a year ago. Business from miscellaneous sources which was exceptionally light during the last month of 1921 is also expected to revive, now that inventory taking is out of the way, as stocks of jobbers and manufacturers alike are generally low. Public improvements and private building projects which have been held in abeyance are expected to go ahead in view of the favorable terms under which money can now be borrowed for legitimate enterprise. In a word, producers look forward hopefully in the new year, and while they recognize the fact that cautious buying will probably continue the rule until freight rates are reduced and coal miners wages are adjusted, they believe that a slow, but steady, improvement in business is in store for the industry during the coming quarter.

Owing to the fact that much of the tonnage it has recently booked called for deferred delivery, the Illinois Steel Co.'s operations have declined, its steel output being on a 35 per cent basis. The Inland Steel Co., after having shut down a number of mills during the holidays, has resumed operations on a 50 per cent basis. The operations of other mills are irregular.

Pig Iron.—The market was quiet between the holidays and among the few sales made may be mentioned 350 tons of foundry for January shipment to a Michigan point, 200 tons of malleable for first quarter delivery to a local melter, and 125 tons of foundry to a western Illinois consumer for January shipment. The price situation is unchanged. Although a steel works furnace, which is booked ahead through January, refuses to quote lower than \$20, base, on foundry, malleable and basic, iron is available from the leading merchant and other sources at \$19 to \$19.50, base furnace. The Auto Specialties Co., Benton Harbor, Mich., is inquiring for 2000 tons of malleable for second quarter delivery. A Wisconsin melter wants 500 tons of malleable for first quarter delivery. Some resale iron has been disposed of recently and it is reported that a fair quantity is still on the market. No sales of Southern iron are reported, but \$17, base Birmingham, is freely quoted and is intimated that \$16.50 might be done. We note a sale of a carload of charcoal to a local melter and of another carload for export both at \$28, base furnace.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging	
sil 1.50, delivered at Chicago.....	\$31.50
Northern coke, No. 1, sil. 2.25 to 2.75.....	\$19.50 to 20.00
Northern coke, foundry, No. 2, sil.	
1.75 to 2.25.....	19.00 to 19.50
Northern high phos.....	19.00 to 19.50
Southern foundry, sil. 1.75 to 2.25.....	23.07
Malleable, not over 2.25 sil.....	19.00 to 19.50
Basic.....	19.00 to 19.50
Low phos., Valley furnace, sil. 1 to 2	
per cent copper free.....	33.00
Silvery, sil. 8 per cent.....	32.82 to 34.82

Ferroalloys.—We note inquiries for one carload each of ferromanganese, spiegeleisen 50 per cent and ferrosilicon from local melters. Otherwise the market is without features.

We quote 78 to 82 per cent ferromanganese, \$66.75, delivered; 50 per cent ferrosilicon, \$60, delivered; spiegeleisen, 18 to 22 per cent, \$36 to \$37, delivered.

Rails and Track Supplies.—Within the past week the Gary mill has booked a number of rail orders from local roads aggregating 30,000 tons. The Louisville & Nashville has placed 50,000 tons with the Tennessee company. There is little inquiry for track accessories

and few orders for light rails are being booked. Light rails rolled from new billet stock are available at from 1.60c. to 1.65c., f.o.b. mill, while rerolled rails can be bought as low as 1.50c. mill.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.60c. to 1.65c. f.o.b. makers' mills. Standard railroad spikes, 2.15c. to 2.25c., Pittsburgh; track bolts with square nuts, 3.20c. to 3.25c., Pittsburgh; tie plates, steel and iron, 1.875c. to 2c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Railroad Equipment.—The John Morrell Co., packer, Ottumwa, Iowa, has ordered 100 refrigerator cars from the American Car & Foundry Co. The Seaboard Air Line has bought 25 locomotives from the American Locomotive Co., and is reported to have placed 2500 freight cars of various types with the Chickasaw Ship Building & Car Co. The Delaware, Lackawanna & Western is inquiring for five locomotives. The Burlington is expected to close for 7300 freight cars this week and the Illinois Central will take early action on 2200 cars, of which 1500 gondolas are for its own lines and 500 box and 200 gondola cars for its subsidiary, the Central of Georgia. The Great Northern is inquiring for 20 passenger cars. The Great Northern will not take action on its inquiry for freight cars until after Jan. 10. The Union Pacific, which recently put out inquiries for 1500 freight cars, has increased the total to 5500 cars.

Bars.—Outside of encouraging tonnages coming from car builders, little new business in mild steel bars is developing. With inventory taking out of the way, however, jobbers and miscellaneous manufacturers are expected to enter the market to replenish their stocks. The price situation shows no material change. In the reinforcing field few new lettings are reported, although considerable work is in prospect. For a tuberculosis sanatorium for disabled volunteer soldiers at Milwaukee 500 tons are reported to have been awarded to the C. A. P. Turner Co. A local rail carbon steel bar mill will furnish 150 tons for the J. L. Taylor Building, Chicago. On Jan. 13, bids will be taken on the general contract for aeration and sedimentation tanks at the Jones Island sewage disposal plant, Milwaukee. About 5000 tons of reinforcing is involved. Bar iron demand is still of a spasmodic character, and mill operations are irregular. One local mill is now idle, while another has been operating for three weeks and still has another week's work ahead. The price situation is on about the same basis as a week ago, although quotations of 1.60c., Chicago, are commoner than 1.65c. Demand for hard steel bars is so light that it is difficult to ascertain what the ruling market price is.

Mill prices are: Mild steel bars, 1.60c. to 1.75c., Chicago; common bar iron, 1.60c. to 1.65c., Chicago; rail carbon, 1.65c., mill or Chicago.

Jobbers quote 2.68c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.55c. for rounds and 4.05c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 2.38c. base. Hoops and bands, 3.28c.

Wire Products.—Demand was very light during the last week of 1921, but with inventory taking out of the way, buyers are now expected to come into the market for their needs. The stocks of users, and particularly jobbers, are low and buying for replenishment purposes is looked for. A number of fair-sized inquiries for wire rods have been received from wire mills, and it is said that as low as \$37 has been quoted. For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 128.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg. The mill quotation on plain material ranges from 1.60c. to 1.75c., Chicago. Jobbers quote 2.78c. for materials out of warehouse.

Bolts and Nuts.—The market is still quiet and weak, but some replenishment buying is expected during the coming month. For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 128.

Jobbers quote structural rivets, 3.48c.; boiler rivets, 3.58c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 and 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Sheets.—Demand is thinning out and it is apparent that buyers are waiting for some weakness to develop in present prices, which are very firm. Mills, however, take the position that inasmuch as sheets are in constant use and consumers' stocks are scraping bottom, it is only a question of time when buyers will be forced to re-enter the market for their requirements.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stocks, No. 10 blue annealed, 8.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Structural Material.—Numerous public improvements as well as other building projects are expected to go ahead this year not only because construction costs have declined materially during the past 12 months, but also because funds for legitimate enterprise are now easily obtainable at reasonable rates. It is also to be noted that railroad construction work is expanding. Out of 29 inquiries recently received by a local fabricator, 16 were from railroads. While much of this railroad work is small, some of it runs into fair tonnages. Recent lettings include:

Blum Building addition, Chicago, 613 tons, to Vanderkloot Iron Works.

Black River bridge, Black River Falls, Wis., 305 tons, to Worden-Allen Co.

Minnesota State bridges Nos. 3660 and 3661, New Ulm, 249 tons, to Illinois Steel Bridge Co.

Huaso and Alamo Creek bridges, San Luis Obispo County, Cal., 219 tons, to Minneapolis Steel & Machinery Co.

Marquette Portland Cement Co., main shop and office building, La Salle, Ill., 350 tons, to Worden-Allen Co.

Wisconsin Highway Commission, 180-ft. span, Tomahawk, Wis., 100 tons, to Worden-Allen Co.

Chicago, Burlington & Quincy, seven deck plate girder spans, 300 tons, to McClintic-Marshall Co.

Chicago, Rock Island & Pacific, seven 90-ft. deck plate girder spans, 570 tons, to American Bridge Co.

Contracts Pending

Cadillac Foundry Co., foundry building, Cadillac, Mich., 301 tons, bids taken by Frank D. Chase, Inc., Chicago.

Pollak Steel Co., South Chicago, Ill., new plant to replace present facilities, about 600 tons.

Great Northern Railroad, bridges, 650 tons.

Cast-Iron Pipe.—Several inquiries have appeared as the new year opens and sellers look for much additional work to come up for bids in the near future. Recent lettings include:

Denver, 343 tons to Colorado Fuel & Iron Co.

Marion, Ind., 76 tons of pipe and fittings to James B. Clow & Sons.

Prospective business includes:

Akron, Ohio, 900 tons, bids in Jan. 6.

Ellis, Kans., 269 tons of 4 and 6-in., Jan. 9.

Woodward, Okla., 80 tons, Jan. 4.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$47.10 to \$48.10; 6-in. and above, \$43.10 to \$44.10; class A and gas pipe, \$4 extra.

Plates.—Local mills booked additional tonnage from carbuilders and tank fabricators during the last week of 1921. While orders for plates, shapes and bars came chiefly from these sources during the closing months of the past year, general demand is expected to revive soon, as consumers are bare of stocks and will be forced to buy material to fill their own orders. On the other hand, it seems assured that tank builders and car shops will continue to require large tonnages of steel. The Pierce Oil Co. is now in the market for storage tanks for the new Mexia (Texas) field, involving from 4000 to 8000 tons of plates. Another new oil field is about to be developed near Denison, Texas, with the probable result that there will again be a demand for large storage facilities.

The outlook in car construction is even more encouraging. Fully 25,000 freight cars are expected to be bought by railroads in this district early in the year. Action on a number of inquiries put out late in 1921 was deferred pending a reduction in the prices of patented car specialties, lower quotations on which are expected to be announced early this month.

The ruling mill quotations range from 1.60c. to 1.75c., Chicago. Jobbers quote 2.78c. for plates out of stock.

Coke.—Local by-product foundry coke has been reduced to \$10.75, delivered in the Chicago switching district.

Old Material.—Consumptive buying is at a minimum, but dealers are laying in stocks in anticipation of later demand. These purchases by sellers have tended to strengthen the market somewhat and a few advances are noted below. Railroad offerings include the Baltimore & Ohio, 10,000 tons; the Chicago & North Western, 3300 tons; the Lake Erie & Western, 10 cars; the New York Central and the Michigan Central, blind lists.

We quote delivery in consumers' yards Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.00 to \$18.50
Relaying rails	23.00 to 27.50
Cast iron car wheels	15.50 to 16.00
Roller or forged steel car wheels	13.00 to 13.50
Steel rails, rerolling	12.50 to 13.00
Steel rails, less than 3 ft.	12.50 to 13.00
Heavy melting steel	11.50 to 12.00
Frogs, switches and guards cut apart	11.50 to 12.00
Shoveling steel	11.00 to 11.50
Low phos. heavy melting steel	13.50 to 14.00
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	7.50 to 8.00
Axle turnings	8.50 to 9.00

Per Net Ton	
Iron angles and splice bars	14.00 to 14.50
Steel angle bars	10.50 to 11.00
Iron arch bars and transoms	15.00 to 15.50
Iron car axles	19.00 to 19.50
Steel car axles	12.50 to 13.00
No. 1 busheling	8.25 to 8.75
No. 2 busheling	6.00 to 6.50
Cut forge	10.25 to 10.75
Pipes and flues	7.00 to 7.50
No. 1 railroad wrought	10.50 to 11.00
No. 2 railroad wrought	10.00 to 10.50
Steel knuckles and couplers	11.50 to 12.00
Coil springs	12.50 to 13.00
No. 1 machinery cast	12.50 to 13.00
No. 1 railroad cast	12.00 to 12.50
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	3.50 to 4.00
Cast borings	5.50 to 6.00
Stove plate	12.00 to 12.50
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	11.50 to 12.00
Agricultural malleable	11.50 to 12.00

Cleveland

CLEVELAND, Jan. 3.

Iron Ore.—Several consumers cut off dock shipments Jan. 1, when the higher rail rates for carrying ore to interior furnaces were restored and the movement from docks is expected to be very light during the next few months. Several additional mines in the Lake Superior district have resumed operations.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45. Old range non-Bessemer, 51½ per cent iron, \$5.70. Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—The market was unusually dull during the past week and very little new inquiry is pending. A local interest reports the sale of 1200 tons of foundry iron on the basis of \$20, Valley, for shipment from western Pennsylvania to a Pittsburgh district consumer and a Columbus, Ohio, melter purchased 500 tons of malleable iron. One lake furnace sold 1500 tons of foundry iron in small lots during the week. On foundry iron \$19 has become the more common price with one or more lake furnaces, but for delivery in the immediate vicinity of the furnace \$20 is still the usual quotation. For Cleveland delivery slightly higher prices are still obtainable. A sale of 200 tons by a Cleveland furnace to a local consumer at \$20.50 is reported. Sellers look for a more active market during the month. Prices on low phosphorus iron have declined and the sharp cut made by Eastern producers may cause further concessions. A few small lot sales are reported at \$33 and \$33.50. Southern iron is inactive and is now freely offered at \$17, Birmingham.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$20.21 to \$20.71
Northern No. 2 fdy., sil. 1.75 to 2.25	19.00 to 20.00
Southern fdy., sil. 2.25 to 2.75	24.17
Ohio silvery, sil. 8 per cent	32.86
Standard low phos., Valley furnace	33.00

Semi-Finished Steel.—Two or three inquiries for sheet bars in lots of 1000 tons have come out. Common quotations are \$30 for sheet bars and \$29 for slabs, but the market does not appear firm.

Finished Iron and Steel.—With the start of the New

Year a few consumers are seeking to get under cover with contracts and the trade looks for more activity during the next week or two. Sales during the past week were very light, as was to be expected during the holidays. Among new inquiries is one for 500 tons of spring steel. Prices are holding firm at 1.50c. as a minimum for plates, structural material and steel bars. While less than car lots of plates are being sold at that price, local mills are still taking some orders at 1.60c. to 1.65c., which also appeared to be the ruling prices for boiler plates. Some additional plate tonnage has been placed for the repair of lake boats. The Baltimore & Ohio Railroad has taken bids for bridge work requiring 2000 tons of steel. There is no activity in the local building field, but fabricators look for a fair volume of business early in the year. Hard steel reinforcing bars are inactive, being nominally quoted at 1.50c.

Jobbers quote steel bars 2.54c.; plates and structural shapes, 2.64c.; No. 9 galvanized wire, 3.25c.; No. 9 annealed wire, 2.75c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 3.14c.; cold-rolled rounds, 3.85c.; flats, squares and hexagons, 4.35c.

Sheets.—Inquiry has improved slightly for lots up to 100 tons, but sales were very light during the week. Regular mill prices are being firmly maintained.

Bolts, Nuts and Rivets.—The leading local maker who has been holding to higher quotations has reduced prices to 2.25c. for structural, 2.35c. for boiler rivets and 70, 10 and 10 per cent off list for small rivets. Bolts and nuts were inactive during the week, but makers look for some revival in business when inventories are completed.

Coke.—There is some car lot demand for foundry coke, sales being mostly at \$4 and \$4.25 for standard Connellsville make. Foundries are not contracting for first quarter, buying only coke that is needed.

Old Material.—There is some local demand for machine shop turnings from the Bourne-Kuller Co., which will blow in the blast furnace of its Upson Nut plant and has made purchases of this grade at \$8.50. This company has a large accumulation of heavy melting steel, so that the starting of its open-hearth plant is not expected to have an important stimulating effect on steel making scrap. As a whole, the market was unusually dull during the week and dealers made little attempt to do business. Prices are firm and unchanged. Dealers look for considerable activity in scrap early this month. Purchases by Ohio mills have been light recently and outside of Cleveland stocks in consumers' yards are reported to be low.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel.....	\$11.50 to \$12.00
Steel rails, under 3 ft.....	12.50 to 13.00
Steel rails, rerolling.....	14.00 to 14.50
Iron rails.....	12.00 to 12.50
Iron car axles.....	18.00 to 19.00
Low phosphorus melting.....	13.00 to 13.50
Cast borings.....	8.60 to 9.00
Machine shop turnings.....	7.50 to 7.60
Mixed borings and short turnings.....	8.60 to 9.00
Compressed steel.....	8.75 to 9.00
Railroad wrought.....	12.00 to 12.50
Railroad malleable.....	12.50 to 13.00
Light bundled sheet stampings.....	6.00 to 7.00
Steel axle turnings.....	9.00 to 10.00
No. 1 cast.....	15.00 to 16.00
No. 1 busheling.....	8.25 to 8.75
Drop forge flashings, over 10 in.....	7.50 to 8.00
Drop forge flashings, under 10 in.....	5.00 to 8.00
Railroad grate bars.....	12.75 to 13.00
Stove plate.....	13.00 to 13.25
Pipes and flues.....	8.50 to 9.00

Birmingham

BIRMINGHAM, ALA., Jan. 3.

At the close of the year the Birmingham iron market was on a base of \$16.50. The immediate cause of lower base was an open offer by a furnace interest of lots of 500 tons and over at that figure for a limited period. This induced competition by other makers and resulted in recession of market to the new base. While some car loads were sold at \$17 during the last week of the year, makers as a rule accepted the new base and almost all business was done at \$16.50. The tonnage booked was not large, nine of the lower prices having stimulated buying. At the same time makers have come to the new year feeling that it is to be better than last. Thirteen blast furnaces were active in Alabama, Jan. 1 compared with five,

July 1. Of the active, Jan. 1, seven were on merchant iron, four on basic and two on charcoal.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, silicon 1.75 to 2.25.....	\$16.50
Basic.....	18.00
Charcoal, warm blast.....	32.00

Old Material.—Scrap dealers look for better business shortly, but it has not opened up yet. Prices quoted are nominal.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails.....	\$11.00 to \$12.00
No. 1 steel.....	10.00 to 11.00
No. 1 cast.....	14.00 to 15.00
Car wheels.....	13.00 to 14.00
Tramcar wheels.....	12.00 to 13.00
No. 1 wrought.....	12.00 to 13.00
Stove plate.....	11.00 to 12.00
Cast iron borings.....	6.00 to 7.00
Machine shop turnings.....	6.00 to 7.00

Buffalo

BUFFALO, Jan. 3.

Pig Iron.—Three furnaces participated in the most recent purchase of the American Radiator Co. when 4400 tons was bought. One interest did not seek the business because of price and shipping conditions and only one furnace of four which bid, did not get any part of the order. While the market on the usual run of business remains firm at \$20 base, it is generally assumed that the radiator tonnage sold at less than this figure. Differentials enter into a transaction only when a very high silicon is required. Inquiry is scattered and in the week ending Dec. 31, 25 requests for prices involved a total of 5000 tons. One inquiry for 1700 tons for January and February delivery and another for 800 tons for January delivery, both within the district, are engaging one furnace. Quotations of \$19 to New England points frequently made in December and the latter part of November have not been offered within the week and the general tendency is to maintain the \$20 level.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.....	\$20.00 to \$21.00
No. 2X foundry, 2.25 to 2.75 sil.....	19.50 to 20.50
No. 2 plain, 1.75 to 2.25 sil.....	19.00 to 20.00
Basic.....	20.00 to 21.00
Malleable.....	20.00 to 21.00
Lake Superior charcoal.....	31.75

Warehouse Business.—Some desirable orders have appeared and the confidence in 1922 business is already reflected to a slight degree. Quick delivery is a requirement on this new business.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.30c.; plates, 2.80c.; plates, No. 8 gage, 3.50c.; soft steel bars and shapes, 2.70c.; hoops and bands, 3.30c.; blue annealed sheets, No. 10, 3.55c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.80c.

Finished Iron and Steel.—Improved tone in all lines is found and particularly good orders for immediate shipment have been received in tin plate and wire products. Toward the end of the week which closed Dec. 31, more than the average run of carload business in bars and plates developed. The Buffalo Steel Car Co. bought 250 tons of plates from a Buffalo interest and the price is understood to have been less than 1.50c. Another Buffalo interest is inquiring for 150 tons of sheets—the largest local inquiry of this kind in some time.

Coke.—Prices have weakened through the disinterest of buyers and best grades now can be obtained at \$4 ovens.

Old Material.—Inquiries from outside the district for heavy melting steel, hydraulic compressed and turnings and borings have failed to develop quotations from dealers here.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel.....	\$13.00 to \$14.00
Low phos., 0.04 and under.....	17.00 to 18.00
No. 1 railroad wrought.....	15.00 to 16.00
Car wheels.....	16.50 to 17.50
Machine shop turnings.....	7.50 to 8.00
Cast iron borings.....	7.00 to 8.00
Heavy axle turnings.....	10.50 to 11.50
Grate bars.....	12.00 to 13.00
No. 1 busheling.....	10.00 to 11.00
Stove plate.....	15.00 to 16.00
Bundled sheet stampings.....	8.00 to 9.00
No. 1 machinery cast.....	17.00 to 18.00
Hydraulic compressed.....	10.50 to 11.50
Railroad malleable.....	13.00 to 14.00

Philadelphia

PHILADELPHIA, Jan. 3.

With profound relief the iron and steel trade observed the passing of the old year. It hopes for better things this year, but the first business day of 1922 brought no change in the situation as it has existed in recent weeks. It is, of course, yet too early to foretell what may happen within the next few months, but there continues a degree of optimism that gradual improvement may be expected. Of fresh developments there is none to point the way, the holiday week having been unusually quiet.

Pig Iron.—During the holiday week there was little closing of pig iron business, sales totaling considerably less than in the preceding week. Most of the tonnages were small—under 500 tons. Eastern pig iron makers have stiffened on prices, with the result that a few large inquiries, one particularly of 3000 tons, and another of 2000 tons of foundry grade, have not been closed because the buyers have been unable to obtain the prices that were open to them a week or two ago. No. 2 plain iron now seems firm at a minimum of \$20, furnace, with all sellers, with No. 2X 50c. per ton higher. A few small sales of low phosphorus iron have been made at \$30 for the copper free and \$28 for the copper bearing, with freight rate added.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.51 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	\$20.84 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.34 to 21.76
Virginia No. 2 plain, 1.75 to 2.25 sil.	27.74 to 28.74
Virginia No. 2X, 2.25 to 2.75 sil.	28.24 to 29.74
Basic deliv. eastern Pa.	20.25
Gray forge	21.00 to 22.00
Malleable	23.00 to 24.00
Standard low phos. (f.o.b. furnace)	30.00
Copper bearing low phos. (f.o.b. furnace)	28.00

Ferroalloys.—Eastern makers continue to quote \$58.35, seaboard, on standard ferromanganese, which is also the British quotation. One or two small inquiries for spiegelisen are in the market. The common quotation is \$25, furnace, for the 18 to 22 per cent grade.

Billets.—Forging billets have been sold at \$32, Pittsburgh. Open-hearth rerolling billets are quite freely quoted at \$28, Pittsburgh.

Old Material.—Dullness continues in the scrap market and prices are virtually unchanged. Forge fire is slightly higher. One Eastern steel company, which had been paying \$12.50 for steel, now offers only \$12. Other sales have been made at \$11.50, delivered. We quote for delivery at consumers' works in this district as follows:

No. 1 heavy molting steel	\$11.50 to \$12.00
Scrap rail	11.50 to 12.00
Steel rails, rerolling	16.25 to 16.75
No. 1 low phos., heavy 0.04 and under	17.00 to 18.00
Car wheels	16.50 to 17.00
No. 1 railroad wrought	14.50 to 15.00
No. 1 yard wrought	12.00 to 12.50
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	9.50 to 10.00
No. 1 busheling	12.00 to 13.00
No. 2 busheling	10.00 to 11.00
Turnings (short shoveling grade for blast furnace use)	9.00 to 9.50
Mixed borings and turnings (for blast furnace use)	9.00 to 9.50
Machine-shop turnings (for rolling mill and steel works use)	9.00 to 9.50
Heavy axle turnings (or equivalent)	9.50 to 10.00
Cast borings (for steel works and rolling mills)	11.50 to 12.00
Cast borings (for chemical plants)	13.50 to 14.00
No. 1 cast	16.50 to 17.00
Railroad grate bars	14.00 to 14.50
Stove plate (for steel plant use)	14.00 to 14.50
Railroad malleable	13.50 to 14.00
Wrought iron and soft steel pipes and tubes (new specifications)	11.50 to 12.00
Iron car axles	No market
Steel car axles	17.00 to 18.00

Finished Steel.—Eastern steel mills have done little business within the past week, but are expecting an improving demand within the next few weeks, as many consumers are known to be in need of steel and have been merely postponing purchases until the new year. Jobbers, in particular, are in need of stock. A slightly better demand for plates is reported by one Eastern

mill, which has booked several orders for boiler steel. Prices of plates, shapes and bars are nominally held at 1.50c., Pittsburgh, and, some Eastern companies say they will not shade these prices. As no business of importance has been completed within the past week the mills have experienced little difficulty in adhering to this schedule.

Warehouse Business.—Prices on steel products out of stock are unchanged and for Philadelphia delivery are as follows:

Soft steel bars and small shapes, 2.65c.; iron bars (except bands), 2.65c.; round edge iron, 2.80c.; round edge steel, iron finish, $1\frac{1}{2}$ x $\frac{1}{2}$ in., 2.95c.; round edge steel planished, 3.70c.; tank steel plates, $\frac{1}{4}$ -in. and heavier, 2.75c.; tank steel plates, $\frac{3}{16}$ -in., 2.925c.; blue annealed steel sheets, No. 10 gage, 3.50c.; light black sheets, No. 28 gage, 4c.; galvanized sheets, No. 28 gage, 5c.; square twisted and deformed steel bars, 2.65c.; structural shapes, 2.60c.; diamond pattern plates, $\frac{1}{4}$ -in., 4.60c.; $\frac{3}{16}$ -in., 4.785c.; $\frac{1}{2}$ -in., 4.90c.; spring steel, 4.10c.; round cold-rolled steel, 3.26c.; squares and hexagons, cold-rolled steel, 3.75c.; steel hoops, No. 13 gage and lighter, 3.60c.; steel bands, No. 12 gage to $\frac{3}{16}$ -in., inclusive, 3.25c.; iron bands, 3.90c.; rails, 2.75c.; tool steel, 8c.; Norway iron, 5c.; toe steel, 4.50c.

New York

NEW YORK, Jan. 3.

Pig Iron.—The most satisfactory feature of the market is the insistence of buyers upon prompt delivery, which indicates that there is demand for all the iron that has been bought. Inquiries amounting to several thousand tons are still pending, but no new business of importance has developed and the past week has been a very quiet one.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	23.02 to 23.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	22.52 to 23.02
Buffalo, sil. 1.75 to 2.25	24.46 to 24.96
No. 2 Virginia, sil. 1.75 to 2.25	27.16 to 28.16

Ferroalloys.—New demand for ferromanganese is confined to carload lots and the inquiries for 500 tons, which have been before the market for the past two weeks, have not yet resulted in orders. Quotations are unchanged. A few carload lots of spiegelisen have been sold at the prevailing quotation, but this market also is devoid of activity. The manganese ore market lacks life and quotations are nominal. Demand for 50 per cent ferrosilicon is confined to carload lots at prevailing quotations. Following are prevailing quotations:

Ferroalloys

Ferromanganese, domestic, delivered, per ton	\$60.00 to \$63.00
Ferromanganese, British, seaboard, per ton	\$58.35
Spiegelisen, 20 per cent, furnace, per ton	\$26.00
Ferrosilicon, 50 per cent, delivered, per ton	\$55.00 to \$57.00
Ferrotungsten, per lb. of contained metal, 40c. to 50c.	
Ferrocromium, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered	11c. to 14c.
Ferrovandium, per lb. of contained vanadium	\$4.50
Ferrocobalt, 15 to 18 per cent, net ton	\$200.00
Ferrocobalt, 15 to 18 per cent, 1 ton to carloads, per ton	\$220.00
Ferrocobalt, 15 to 18 per cent, less than 1 ton, per ton f.o.b. Niagara Falls, N. Y.	\$250.00

Ores

Manganese ore, foreign, per unit, seaboard	20c.
Tungsten ore, per unit, in 60 per cent concentrates	\$2.50 up
Chrome ore, 40 to 45 per cent Cr_2O_3 , crude, per net ton, Atlantic seaboard	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr_2O_3 , crude, per net ton, Atlantic seaboard	\$30.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS_2 , New York	50c. to 60c.

Finished Iron and Steel.—While leading mills claim that they are not attempting longer to meet the severe competition which has marked recent negotiations, little has occurred to establish any stiffening in prices. Buyers firmly believe, for example, that even a carload lot of plates can be bought on the basis of 1.40c., Pittsburgh. A fair run of business is moving. About 1500 tons of plates have been bought for the locomotives to be built by the American Locomotive Co. for the Central Railroad of New Jersey. An eastern Pennsylvania plate maker will supply 1500 to 1800 tons to a leading oil

company. A California oil company is in the market for a 6-in. oil line, taking 650 tons, and 850 tons for a pipe line for another company has probably been closed at this writing. A round lot of tin plates for three months' needs have been purchased by still another oil company. Among railroads, the New York Central has issued an inquiry for first quarter protection as follows, the understanding being that the amounts named are maximum and are not necessarily those which would actually suffice: 500 tons of billets, 3000 tons bars, shapes and plates, 750 tons nails and staples, 600 tons of black, galvanized and blue annealed sheets, 3000 tires, 25,000 boiler tubes, 5000 car axles and also frogs, switches, crossovers and the like. The Seaboard has placed with the Steel Corporation's Chickasaw car plant a total of probably 2000 cars, and while no other new car business is noted, some negotiation is under way on 4000 cars for the Norfolk & Western. The Erie Railroad has placed a total of 35,000 tons of rails. In structural steel lines the largest new project is a 5000-ton structure for the Bank of America on Wall Street. Awards include 400 tons for a factory at Providence for the Textile Finishing Machine Co.; 1400 tons to the American Bridge Co., for Baltimore & Ohio bridges; 500 tons to the Bethlehem Steel Bridge Corporation, for the Gunpowder River Bridge, and 250 tons to the Phoenix Bridge Co., for a ravine crossing of the Palisades Park highway. No decision has yet been announced respecting 2600 tons for the Philadelphia Museum of Art. The Knickerbocker Ice Co. is inquiring for 700 tons for a storehouse.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.88c.; plates, 1.83c. to 1.88c.; structural shapes, 1.88c.; bar iron, 1.98c. to 2.03c. On export shipments the freight rate is now 28 5/8c. per 100 lb., instead of 38c., the domestic rate.

Cast-Iron Pipe.—Bids were opened last week for 500 tons for Providence, R. I., the Warren Foundry & Machine Co., Phillipsburg, N. J., being low bidder; also for 700 tons for New Bedford, Mass., the low bidder being R. D. Wood & Co., Philadelphia. In both instances, sizes ranged from 8 to 16 in. Business is dull, but much better than a year ago. We quote per net ton, f.o.b. New York, carload lots, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

Coke.—Effective Jan. 1, the by-product coke plants in New England reduced prices from \$10.66 to \$10.40, delivered in New England where the freight rates are less than \$3.40. This is equivalent to \$4.24, Connellsville base.

Old Material.—The market has at least this favorable feature—prices have not declined during the past week, though a drop is expected during the holiday period. Dealers are having many cars rejected because the buyer alleges they do not meet specifications. Then the buyer offers them a dollar or so less and because of the high cost of moving dealers accept his offer. This means that New York dealers have disposed of heavy melting steel at as low as \$6, New York.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard.....	\$8.00 to \$8.50
Steel rails, short lengths, or equivalent.....	8.50 to 9.00
Revolving rails.....	9.50 to 10.00
Relaying rails, nominal.....	28.00 to 30.00
Steel car axles.....	10.00 to 10.50
Iron car axles.....	18.50 to 19.00
No. 1 railroad wrought.....	10.50 to 11.00
Wrought iron track.....	8.50 to 9.00
Forge fire.....	5.00 to 5.50
No. 1 yard wrought, long.....	9.00 to 9.50
Cast borings (clean).....	6.50 to 7.00
Machine-shop turnings.....	4.00 to 5.00
Mixed borings and turnings.....	4.00 to 4.50
Iron and steel pipe (1 in. diam. not under 2 ft. long).....	6.75 to 7.25
Stove plate.....	9.00 to 10.00
Locomotive grate bars.....	9.00 to 10.00
Malleable cast (railroad).....	8.00 to 8.50
Car wheels.....	10.50 to 11.50

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast.....	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size.....	15.50 to 16.00
No. 1 heavy cast, not cupola size.....	14.00 to 14.50
No. 2 cast (radiators, cast boilers, etc.).....	10.00 to 10.50

Warehouse Business.—The market was practically at a standstill during the week from Christmas to New Year's. About the only noticeable activity was in payments of accounts by customers. No price changes were made, but before the end of January there may be a slight revision of quotations on some items. We quote prices on page 140.

High-Speed Steel.—The market was featureless this week. Prices continue nominally at 85c. per lb. to 95c. per lb. for 18 per cent tungsten high-speed steel, with special brands of some producers selling up to \$1.05 per lb.

Cincinnati

CINCINNATI, Jan. 3.

Pig Iron.—The market was unusually quiet during the holiday period, and few sales were recorded. The majority of these were for carload lots, and in no instance were more than 100 tons involved. The inquiry is also light, some of those mentioned in last week's report not having been closed. There is some inquiry for ferroalloys, however, one being for 800 tons and one for 500. Prices are inclined to be softer in pig iron, and Southern iron is now definitely established on a \$16.50, Birmingham, base, with reports current that even this could be shaded on large tonnages. Some resale Southern iron is reported to have been sold in carload lots at \$16.25, but \$16.50 more truly represents the market to-day. In the North, \$19 to \$20 continues as the range, though it is reported that on an inquiry for 300 tons of malleable, one Lake furnace intimated that it would shade \$19 to get the order. Chicago furnaces are understood to have adopted \$20 as the base, and will not sell for other than January delivery. Nineteen fifty to twenty is still the asking price on southern Ohio irons, depending on location of the furnace competition. Portsmouth and Sarah furnaces were blown in while Jisco silvery stack went out during the week. Union foundries in Cincinnati are closed following the posting of a notice by the employers that, effective Jan. 3, molders' wages would be reduced to \$5. Negotiations regarding a wage scale have been going on for some time, and it is likely they will be continued. Union workmen have refused to consent to the reduction and are remaining away from the shops.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base)	\$21.00
Southern coke, sil. 2.25 to 2.75 (No. 2 soft)	21.50
Ohio silvery, 8 per cent sil.	32.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2)	\$22.02 to 22.52
Basic, Northern	22.02
Malleable	22.52

Finished Material.—The customary holiday quiet prevailed during the past two weeks in the market for finished material, but strange as it may seem, the orders booked during the month of December by local offices of some steel companies were heavier than for the same month of the past three years. These orders were made up mostly of small lots and included bars, shapes, plates and wire products. During the week, several orders for 200 tons of plates were booked by an independent mill and two lots of structural shapes were also taken by another interest. Prices are inclined to be firmer and 1.50c. is being rigidly held to on current orders for bars, shapes and plates. On wire products \$2.50, Pittsburgh, is now the general quotation on nails, and \$2.25 per 100 lb. on plain wire. There are few inquiries of size before the trade. The Big Four Railroad will close bids this week on its first quarter requirements for steel, wire, bolts, axles, etc. No tonnage is specified. In the structural field the only new project to come up is the Capitol Theater at Frankfort, Ky., in which 250 tons of steel is involved. Bids will close on Jan. 4. The General Iron Works Co., Cincinnati, will fabricate 250 tons for the Elks Temple in that city. The Sneed Architectural Iron Works will fabricate 190 tons for an addition to the plant of the Standard Sanitary Mfg. Co. at Louisville, Ky., and the Moss Iron Works, Wheeling, has been awarded 125 tons for the Ravenna, Ohio, high school. A small building for the Procter & Gamble Co. at Staten Island, N. Y.,

involving 60 tons has been let to an Eastern fabricator. Bids will close Jan. 8 for an auditorium and market building at Memphis, Tenn., 3500 tons of steel being required. The architects on the 12-story warehouse building for the Belknap Hardware Co., Louisville, Ky., have postponed the opening of bids until Jan. 9. Bids are being taken on both a steel and reinforced concrete building.

Old Material.—There is no activity in the scrap market. Two steel plants operating in this district today notified dealers to suspend shipments till further advised. Locally the scrap market is extremely dull. Some blast furnace scrap was sold during the week for delivery to a southern Ohio furnace which is resuming operations. Prices are unchanged.

We quote dealers' buying prices, f.o.b.

Per Gross Ton	
Bundled sheets	\$3.50 to \$4.00
Iron rails	12.00 to 12.50
Relaying rails, 50 lb. and up	25.00 to 26.00
Hotrolling steel rails	10.50 to 11.00
Heavy melting steel	9.00 to 9.50
Steel rails for melting	9.00 to 9.50
Car wheels	12.00 to 13.00

Per Net Ton	
No. 1 railroad wrought	8.50 to 9.50
Cast borings	3.00 to 3.50
Steel turnings	2.00 to 2.50
Railroad cast	12.00 to 12.50
No. 1 machinery	13.50 to 14.50
Burnt scrap	7.50 to 8.00
Iron axles	15.50 to 16.50
Locomotive tires (smooth inside)	9.50 to 10.00
Pipes and flues	4.00 to 4.50

Boston

BOSTON, Jan. 3.

Pig Iron.—Eastern Pennsylvania furnaces are talking higher prices and are more insistent on silicon differentials, and yet three inquiries for 500 tons each brought out lower prices this week, by at least those furnaces that took the business. In addition, one of these lots sold for second quarter delivery, business furnaces insist they do not want just now. The weakness of these eastern Pennsylvania furnace prices naturally has influenced Buffalo furnace quotations and the market for these two kinds of irons, in the closing days of 1921, were about as weak as at any previous period of the year. Eastern Pennsylvania No. 2 X iron sold this week at \$19.50, furnace, or \$23.68 delivered, tax paid, and Buffalo No. 2 X on the same delivered basis, tax paid, which brings the price at the furnace down to approximately \$18. No sales of Virginia iron are reported and prices are nominal. Business in Alabama iron is confined to an occasional car for mixture purposes, and the market is \$1 lower in sympathy with sales made in the South. The most important sales reported this week in the New England territory are 250 tons No. 2 X and 250 tons No. 2 plain, eastern Pennsylvania, first quarter delivery, to a maker of textile machinery; 500 tons No. 2 X eastern Pennsylvania, second quarter delivery, to a Vermont melter; 350 tons eastern Pennsylvania and 300 tons Buffalo No. 1 X, and 150 tons eastern Pennsylvania and 100 tons Buffalo No. 2 X, first quarter delivery, to the Framingham Foundries, Framingham, Mass.; and 150 tons Northern No. 2 X, first quarter delivery, to a Portland, Me., stove maker. One furnace representative reports an inquiry for several thousand tons of iron for first and second quarter delivery, but full details are lacking.

We quote delivered at common New England points as follows, having added to furnace prices \$4.06 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East Penn., silicon 2.25 to 2.75	\$24.06 to \$25.06
East Penn., silicon 1.75 to 2.25	23.56 to 24.56
Buffalo, silicon 2.25 to 2.75	24.46 to 25.96
Buffalo, silicon 1.75 to 2.25	24.46 to 25.46
Virginia, silicon 2.25 to 2.75	29.08 to 30.08
Virginia, silicon 1.75 to 2.25	28.58 to 29.58
Alabama, silicon 2.25 to 2.75	28.16
Alabama, silicon 1.75 to 2.25	27.66

Cast Iron Pipe.—The City of New Bedford, Mass., this week opened bids on 705 tons 2 to 12-in. pipe and 14 tons of specials, and the City of Providence, R. I., on 500 tons b and s pipe, made in accordance with Providence specifications. R. D. Wood & Co. were low bidders on the New Bedford lot, there being three other bidders. The actual award will be made within ten days. The Warren Foundry & Machine Co., Phillips-

burg, N. H., was lowest of three bidders on the Providence lot. Salem, Mass., has awarded 1085 ft. of pipe and a small list of specials to the Donaldson Iron Co., Emaus, Pa., against three other bidders. The same company is awarded 900 tons of 4 to 12-in. gas pipe, first half delivery, by the Boston Consolidated Gas Co., Boston. Pipe makers are quoting as heretofore, namely, per net ton f.o.b. Boston and district, in carload lots, 3-in., \$66.70; 4-in., \$56.70; 6-in., \$50.70; 10-in. and larger, \$49.70, with \$4 differentials on class A and gas pipe.

Finished Iron and Steel.—The Boston Structural Steel Co., Inc., Cambridge, Mass., is awarded 440 tons of structural steel for a local hospital addition, 214 tons for a Brookline, Mass., high school, 150 tons for a Lowell, Mass., school, and approximately 100 tons for a Newton, Mass., high school, a total of about 900 tons. Figures will shortly be out for a Kresge store, Boston, and a two-story addition to a large dry goods store, Boston. Plans are being made for a large hotel, Boston, but the steel probably will be placed through New York. Practically no bars were purchased from the mills this week, and plate tonnages booked were unimportant. The market on plates, shapes and bars is generally 1.50c., Pittsburgh. Wire products, especially poultry netting, are in demand, and New England mills are operating at close to capacity.

Jobbers now quote: Soft steel bars, \$2.71½ per 100 lb. base, flats, \$3.21½; concrete bars, \$2.20 to \$2.71½; tire steel, \$4 to \$4.40; spring steel, open hearth, \$4.50; crucible, \$11.50; steel bands, \$3.31½ to \$3.78; steel hoops, \$3.31½; toe rail steel, \$5; cold rolled steel, \$3.55 to \$4.05; structural steel, \$2.71½; plates, \$2.81½ to \$2.99; No. 10 blue annealed sheets, \$3.73; No. 28 black sheets, \$4.50; No. 28 galvanized sheets, \$5.50; refined iron, \$2.71½; best refined, \$4.25; Wayne iron \$5.50; Norway iron, \$5.50 base.

Old Material.—Local old material firms report almost nothing being done in the way of new sales. The little activity noted concerns the filling of contracts placed by Pennsylvania mills some time back. These consumers at the moment show little inclination to cover future requirements, while the daily melt of the average New England foundry is such that requirements can be obtained from local scrap dealers. Market prices, due to the lack of business, naturally have little opportunity to change. They are generally described here as firm, and dealers anticipate securing ruling or higher prices when trading resumes.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery cast	\$18.00 to \$19.00
No. 2 machinery cast	16.00 to 17.00
Stove plate	14.50 to 15.00
Railroad malleable	13.50 to 14.00

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$7.50 to \$8.00
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.00 to 7.50
Machine shop turnings	3.50 to 3.75
Cast iron borings, rolling mill	5.75 to 6.50
Cast iron borings, chemical	7.00 to 7.25
Blast furnace borings and turnings	3.50 to 3.75
Forged scrap and bundled skeleton	4.50 to 5.00
Steel car axles and shafting	11.50 to 12.00
Car wheels	11.00 to 11.50
Hotrolling rails	10.00 to 10.50

St. Louis

ST. LOUIS, Jan. 3.

Pig Iron.—The sale for pig iron the last week has been confined largely to carload orders, one order of 200 tons of foundry iron being placed. Inquiries are for carloads mostly, and these were of fair volume. Most of the trade still was waiting for the New Year before placing orders for more than actual requirements. The market on Northern iron may be said to be \$19, Chicago, while Southern iron is at \$16.50, Birmingham.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.88 freight and war tax from Chicago and \$5.91 from Birmingham:

Northern foundry, sil. 1.75 to 2.25	\$21.88
Northern malleable, sil. 1.75 to 2.25	21.88
Basic	21.88
Southern foundry, sil. 1.75 to 2.25	22.41

Finished Iron and Steel.—The business from rail-

(Continued on page 132)

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic...	\$0.35	Kansas City	\$0.815
Philadelphia, export...	0.285	Kansas City (pipe)...	0.77
Baltimore, domestic...	0.335	St. Paul	0.685
Baltimore, export	0.255	Omaha	0.815
New York, domestic...	0.38	Omaha (pipe)	0.77
New York, export	0.285	Denver	1.35
Boston, domestic	0.415	Denver (wire products) ..	1.415
Boston, export	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates ..	1.335
Cleveland	0.24	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail..	0.565
Cincinnati	0.325	Jacksonville, rail and	
Indianapolis	0.345	water	0.46
Chicago	0.38	New Orleans	0.515
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1; wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 2 1/4c. per in. in fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zebs, structural sizes, 1.50c.

Sheared plates, 1/4 in. and heavier, tank quality, 1.50c.

Wire Products

Wire nails, \$2.50 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75; bright Bessemer and basic wire, \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 8, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.15; galvanized fence staples, \$3.15; painted barbed wire, \$2.65; polished fence staples, \$2.65; cement-coated nails, per count keg, \$2.00; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 10 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 68 to 70 1/2 per cent off list for carload lots; 67 to 69 1/2 per cent for 1000-rod lots, and 66 to 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 5 to 70, 10 and 7 1/2 per cent off list

Machine bolts, small, cut threads, 70 and 5 to 70 and 10 per cent off list

Machine bolts, larger and longer, 65, 10 and 5 to 70 and 10 per cent off list

Carriage bolts, 3/4 in. x 6 in.; smaller and shorter rolled threads, 65, 10 and 10 per cent off list

Cut threads 65 and 10 to 70 per cent off list |

Louger and larger sizes 65 and 10 to 70 per cent off list |

Lag bolts 70 and 10 to 70, 10 and 5 per cent off list |

Low bolts, Nos. 1, 2 and 3 heads 60 and 10 per cent off list |

Other style heads 20 per cent extra |

Machine bolts, c.p.c. and t. nuts, 3/4 in. x 4 in.; smaller and shorter 65 and 5 per cent off list |

Larger and longer sizes 65 per cent off list |

Hot pressed sq. or hex. blank nuts \$5.50 off list |

Hot pressed nuts, tapped \$5.00 to \$5.25 off list |

C.p.c. and t. sq. or hex. blank nuts \$5.25 off list |

C.p.c. and t. sq. or hex. blank nuts, tapped \$5.00 off list |

Semi-finished hex. nuts:

1/4 in. to 9/16 in. inclusive 80, 10 and 10 per cent off list |

Small sizes S. A. E. 80, 10, 10 and 10 per cent off list |

3/4 in. to 1 in. inclusive, U. S. S. and S. A. E. 70, 10, 10 and 10 per cent off list |

Stove bolts in packages 80, 10 and 5 per cent off list |

Stove bolts in bulk 80, 10 and 7 1/2 per cent off list |

Tire bolts 65, 10 and 10 per cent off list |

Track bolts, carloads 3c. to 3.25c. base |

Track bolts, less than carloads 4c. to 4.25c. |

Upset Square and Hex. Head Cap Screws

1/2 in. and under 80 and 10 per cent off list |

9/16 in. to 1 in. 80 and 10 per cent off list |

Upset Set Screws

1/2 in. and under 80, 10 and 5 to 85 per cent off list |

9/16 in. to 1 in. 80, 10 and 5 to 85 per cent off list |

Milled Square and Hex. Cap Screws

All sizes 75 and 10 per cent off list |

Milled Set Screws

All sizes 70, 10 and 10 per cent off list |

Rivets

Large structural and ship rivets \$2.25 |

Large boiler rivets 2.35 |

Small rivets 70, 10 and 10 per cent off list |

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$36 to \$38; chain rods, \$36 to \$38; screw stock rods, \$41 to \$43; rivet and bolt rods and other rods of that character, \$36 to \$38; high carbon rods, \$43 to \$50, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9/16-in. and larger, \$2.25 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/4-in. and 7/16-in., \$2.35 to \$2.40 base; 5/16-in., \$2.35 to \$2.40 base. Boat and barge spikes, \$2.35 to \$2.40 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, 3c. to 3.25c. base per 100 lb. Tie plates, \$2 per 100 lb. Angle bars, \$2.40 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package; 8-lb. coating, 1 C., \$9.60; 15-lb. coating, 1 C., \$11.80; 20-lb. coating, 1 C., \$13; 25-lb. coating, 1 C., \$14.25; 30-lb. coating, 1 C., \$15.25; 35-lb. coating, 1 C., \$16.25; 40-lb. coating, 1 C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.50c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Butt Weld			Iron		
Inches	Steel		Inches	Black	Galv.
1/2	Black	54 1/2	1/2 to 3/4	+ 3 1/2	+ 22 1/2

New York

NEW YORK, Jan. 3.

At the beginning of the new year the tone of all the markets is optimistic and the price tendency is strong. The light demand for copper is regarded as temporary and prices are unchanged and firm. The tin market is only moderately active at higher prices than a week ago. Demand for lead is seasonal at unchanged prices, while the demand for zinc is light with quotations unchanged from a week ago.

Copper.—Demand for copper has been exceedingly light, as measured by both inquiry and sales, but prospects for the immediate future are bright. There has been no change in electrolytic prices and the metal is quoted at 13.62½c., refinery, or 13.87½c., delivered, for January and first quarter, although some producers are asking slightly more for delivery beyond January. Inquiry has not broadened beyond the first quarter, unless included in business for the first half, which so far is light. The January quotation of the larger producers for the first quarter is 14c., delivered, or 13.75c., refinery.

Copper Averages.—The average price of Lake copper for the month of December, based on daily quotations in THE IRON AGE, is 13.78c. The average price for electrolytic copper is 13.55c.

Tin.—The closing week of the year has been featured by fairly good sales of early arrivals and actual spot metal, but the total has been small. In futures very little business has been done, although on Friday a few sales were made at 33c. to 33.12½c. Optimism prevails and better buying is expected early in January. Spot Straits tin was quoted to-day at 32.75c., New York, and quotations in London were about £3 per ton lower than a week ago at £168 12s. 6d. for spot standard, £170 10s. for future standard and £170 for spot Straits, with the Singapore price at £173 5s. on Monday. Deliveries into consumption for December were 3710 tons and the stock on Dec. 31 and the quantity in landing were 516 tons and 1180 tons, respectively.

Lead.—Sales of fairly liberal proportions were made last Friday on a basis of 4.40c., St. Louis; otherwise the market has been quiet. The leading interest continues to quote 4.40c., both New York and St. Louis, while in the outside market the St. Louis quotation has stiffened at the firm price of 4.40c., with the New York quotation at 4.75c.

Zinc.—Sales of carload lots constitute the present demand which is light. Prime Western for early delivery is quoted by some sellers at 4.82½c. and by others at 4.85c., St. Louis, sales having been made at both of these levels. We quote the market for January or 30-day delivery at 4.82½c., St. Louis, or 5.17½c., New York, with February and March five points higher, respectively. While inquiry is light for these positions it is believed that demand will be better as the months advance.

Antimony.—The market is quiet and unchanged at 4.50c., New York, duty paid, for wholesale lots for early delivery.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in wholesale lots for early delivery is quoted at 19c.,

f.o.b. plant, but the same grade is quoted by importers at 17c. to 18c., New York, duty paid. Demand is light.

Old Metals.—Prices are firm though very few transactions are reported. Dealers' selling prices are as follows:

	Cents Per Lb.
Copper, heavy and crucible.....	13.25
Copper, heavy and wire.....	12.50
Copper, light and bottoms.....	10.00
Heavy machine composition.....	10.25
Brass, heavy.....	8.00
Brass, light.....	6.00
No. 1 red brass or composition turnings.....	8.25
No. 1 yellow rod brass turnings.....	6.25
Lead, heavy.....	4.25
Lead, tea.....	3.25
Zinc.....	3.00

Chicago

JAN. 3.—The metals were very quiet between the holidays, but copper, lead and zinc made slight advances. The old metal prices remain unchanged. We quote in carload lots: Lake copper, 14c.; tin, 33.75c.; lead, 4.50c.; spelter, 4.90c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 8c.; red brass, 8.25c.; yellow brass, 5.75c.; lead pipe, 3.25c.; zinc, 2.37½c.; pewter, No. 1, 23c.; tin foil, 24c.; block tin, 26c.; all buying prices for less than carload lots.

St. Louis

JAN. 3.—Lead and zinc are slightly easier. Lead is quoted at 4.37½c., car lots, and slab zinc, 4.82½c. On old metals we quote: Light brass, 3.50c.; heavy red brass and light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; zinc, 2c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Copper in the United States in 1921

Smelter production of copper from ore mined in the United States was about 205,800 gross tons in 1921; refinery production was about 411,000 tons, of which 268,300 tons was from domestic material and the balance from foreign material. These figures, from the United States Geological Survey, show definite figures for eleven months and the producing companies' estimates for December.

Imports for eleven months amounted to about 142,000 gross tons, of which 30,400 tons was refined and 70,100 tons blister copper, the balance being ore, concentrates and matte. Exports for eleven months totaled about 253,000 gross tons, of which 240,000 tons was new refined copper, and 13,000 tons manufactured—wire, rods, pipes, tubes, sheets, etc.

Domestic consumption of refined copper is estimated at 255,400 gross tons, compared with 470,500 tons in 1920, as shown in the following table:

Gross Tons	1920	1921
Refinery production:		
from domestic sources.....	527,700	268,300
from foreign sources.....	153,600	142,900
Imports of refined copper.....	48,700	33,500
Stocks, Jan. 1, 1921.....	281,700	294,200
Total available.....	1,011,700	738,900
Exports, exclusive of manufactured	247,000	262,000
Stocks, Dec. 31, 1921.....	294,200	221,500
	541,200	483,500
Domestic withdrawals.....	470,500	255,400

The Worcester, Mass., section A. S. M. E., held a smoker in the Boys' Trade School Tuesday evening, Jan. 3, at which C. L. Ipsen, General Electric Co., delivered an address on Mechanical Heating Problems Solved Electrically. A. M. Brewster, Atlas Die Casting Co., Worcester, will talk on Manufacturing and use of Die Castings, at a meeting of the Worcester section, on Jan. 24, at the North Works, American Steel & Wire Co. F. Harold Daniels, R. Sanford Riley Stoker Co., Worcester, also will talk, on a Closeup of Stoker Combustion, using moving pictures.

PERSONAL

Edward Worcester, vice-president in charge of sales, National Tube Co., Pittsburgh, has resigned, effective Jan. 1. Mr. Worcester has been identified actively with the tubular steel trade for more than 30 years, and has a legion of friends from the Atlantic to the Pacific who hold him in the highest esteem. He retires from active business to take a well earned rest, but will still hold an inactive connection with the National Tube Co. He will devote his time to private interests and further study of subjects in which he is vitally interested. Mr. Worcester was born in East Bridgewater, Mass., Jan. 29, 1855, and his first business connection was with the Chapman Valve Co., Boston.

EDWARD WORCESTER

He entered the employ of that company in 1870, just 52 years ago, and in 1875 had reached the position of salesman. He left that position in 1875, to become head salesman in the Chicago agency of the National Tube Works Co. From 1877 to 1882 he was salesman for Walworth Mfg. Co., Boston, and from 1882 until 1886 he was assistant secretary, and later secretary of Crane Bros. Mfg. Co., Chicago. In 1888, he was appointed local manager of the St. Louis office of the National Tube Works Co., combined with this being the position of secretary of the Western Tube Co., Keewaupee, Ill., in which the National Tube Works Co., in 1890, acquired an interest. In 1897, Mr. Worcester was appointed assistant sales manager of the National Tube Works Co., McKeesport, Pa. This company was later taken over by the United States Steel Corporation, which also took over nearly every important tube plant in the country, and its name was changed to the National Tube Co. In 1903, he was appointed vice-president of the National Tube Co., in charge of sales, which position he held until his retirement. John H. Nicholson, who has been with the company for 22 years, for several years as vice-president in charge of operations of the seamless tube plants of the company, relinquishes those duties to take up those of Mr. Worcester. Mr. Nicholson was one of the owners of the Standard Seamless Tube Works, Ellwood City, Pa., which was acquired by the National Tube Co., in 1900, at which time he became affiliated with the latter. Taylor A. Allderdice, vice-president in charge of operations at all except the seamless tube works, now takes charge of operations at all plants of the company.

Peter S. Steenstrup, vice-president and general manager General Motors Export Co. New York, has been appointed assistant to Alfred P. Sloan, Jr., vice-president in charge of operations of the General Motors Corporation.

H. E. Forbes, Buffalo, has been elected president of the Pierce Arrow Motor Car Co., succeeding Col. George W. Mixter, resigned. Col. Charles Clifton will continue as chairman of the board.

Edwin C. Foster has been appointed manager of the Pittsburgh sales office of E. J. Lavino & Co., Bullitt Building, Philadelphia, manufacturers of ferromanganese and other ferroalloys. The company's new Pittsburgh office is in the Oliver Building. Mr. Foster has for some time been associated with the company at its main office in Philadelphia.

Bruce Haines, assistant manager Crawfordsville Wire & Nail Co., Crawfordsville, Ind., has resigned and will become general manager of the Davenport, Iowa, branch of the Nichols Wire & Sheet Co. Kansas City, Mo.

Ferdinand W. Roebling, John A. Roeblings' Sons

Co., Trenton, N. J., has been elected a director of the Otis Elevator Co. New York.

Col. William C. Skinner, formerly president Colt's Patent Fire Arms Mfg. Co., Hartford, Conn., has sailed for South America to be away about a month. He is recovering from a nervous illness.

S. F. Bowser, founder and president of S. F. Bowser & Co., Fort Wayne, Ind., manufacturers of pumping equipment, has retired from the presidency of the company and will be succeeded by S. B. Bechtel, general manager of the company for the past seven years.

Edward M. Adams will be first vice-president and general manager of sales of the Inland Steel Co., succeeding G. H. Jones. Walter C. Carroll will be vice-president in charge of sales for the sheet division, and Charles R. Robinson vice-president in charge of sales for the rail and track accessories division. Photographs and biographical sketches of Messrs. Jones and Carroll were published in these columns on Nov. 10 and 3, 1921, respectively. Edward Martin Adams has spent 16 years of his business career with the Inland company. He was born at Cherry Valley, Ill., on Dec. 1, 1876, and there learned telegraphy. For a number of years he served as telegraph operator and agent at various points on the western lines of the Illinois Central Railroad, and in 1900 became identified with the Buda Co., Harvey, Ill., as traffic manager. Five years later he joined the staff of the Inland Steel Co. as secretary, a position which he held continuously until August, 1919, when he was made vice-president and secretary. By virtue of his long and uninterrupted service with the Inland organization at Chicago, Mr. Adams has won a wide acquaintanceship in the territory his company serves and has acquired a thorough knowledge of the individual requirements of consumers in a large section of the country. An understudy of his predecessor ever since he became identified with the iron and steel industry, he is expected to carry forward the sales policies which were in no small measure responsible for the meteoric growth of the Inland company.

W. C. Starkey, for several years chief engineer of the Ohio Brass Co., Mansfield, Ohio, on Jan. 1 became vice-president and directing engineer of the Stevenson Gear Co., Indianapolis, manufacturer of gear cutting machinery.

G. H. Jones, who resigned as first vice-president and general manager of sales of the Inland Steel Co., Chicago, effective Jan. 1, has leased quarters at 1212 First National Bank Building, Chicago, where he will direct the affairs of the Hillside Fluor Spar Mines, Rosiclare, Ill., of which company he is president and treasurer. The Rosiclare property, which is being developed at a cost of several hundred thousand dollars, will go into production early this year. Associated with Mr. Jones in this undertaking as vice-president and general manager is Capt. A. B. Thomas, who has been identified with the fluorspar mining industry since its inception. Mr. Jones retains his heavy interests in the Inland Steel Co. and will continue to serve on its board of directors.

E. W. Goodwin, former engineer for the Packard Motor Car Co., Detroit, has taken a similar position with the Maxwell-Chalmers Co., Detroit.

George M. Humphrey, for several years with the legal department of M. A. Hanna & Co., Cleveland, became a partner in that firm on Jan. 1.

George W. McCandless, secretary and treasurer McConway & Torley Co., Pittsburgh, has been named by Mayor Magee of that city as director of the department of public safety, which embraces the police and fire departments.

Charles E. Drum has been made general manager of the Hayes Manufacturing Co., Detroit, and Joseph Richard chief engineer.

George H. Kuhn, who has been at the Detroit office of the Charles Dreifus Co., Pittsburgh, scrap iron and steel, for the past year, has been transferred to the Cleveland office of the company, in the Guardian Trust Building.

C. F. Rogers, formerly with C. E. Johansson, Inc., Poughkeepsie, N. Y., has joined Purinton &

Smith, machinery and tools, Hartford, Conn., in a selling capacity.

Elton Hoyt, II, who has been associated with Pickands, Mather & Co., Cleveland, for a number of years, and has for some time had charge of that firm's ore sales, was made a member of the firm Jan. 1.

Howard R. Williams has been appointed Philadelphia district sales manager of the Electric Alloy Steel Co., Youngstown, Ohio. The company's Philadelphia office is at 511 Pennsylvania Building. Mr. Williams has been assistant to the general manager of sales at Youngstown and formerly was with the Youngstown Sheet & Tube Co.

John J. Brant, general auditor Youngstown Sheet & Tube Co., Youngstown, Ohio, retired Dec. 31. He will continue to make his home in Youngstown, where he has resided since 1885. He was appointed auditor of the company in 1911, having previously been in the auditing and accounting departments. He has served with the company for 20 years.

George Martin has resigned as auditor of the Youngstown Steel Car Co., Niles, Ohio. He had been previously identified with Price, Waterhouse & Co.

OBITUARY

MASON EVANS, aged 72, for many years actively identified with financial and industrial enterprises of the Mahoning Valley, died Dec. 26 at his home in Youngstown, Ohio, from paralysis, following several years of declining health. His most active connection in the steel industry was as treasurer of the old Youngstown Iron & Steel Co., now the property of the Sharon Steel Hoop Co., Sharon, Pa.

F. ALEXANDER WITTE, president Witte Hardware Co., St. Louis, died Dec. 27 at his residence in that city, at the age of 54 years. He was born in St. Louis Oct. 2, 1868.

EMIL L. MAYER, aged 57, Pittsburgh district manager International Harvester Co. of America, died in his home in Bellevue, Pa., Dec. 28. He had been associated with that company for 41 years, entering its employ as an office boy. He had been general manager in Pittsburgh for 11 years.

THOMAS E. DWYER, president Wakefield Lead & Pipe Co., Lowell, Mass., died Dec. 26 at the St. John's hospital, that city, after an illness of about a month.

WINFIELD EVERETT HOLMES, treasurer Samuel M. Green Co., Springfield, Mass., and an authority on industrial processes, methods and equipments, steam and hydraulic power plants, the elimination of waste in industrial processes, and in the generation of power, died Dec. 25, at his home in Springfield, following a five months' illness. Mr. Holmes was born May 10, 1881.

DAVID J. BRAUN, one of the pioneers in the lighting fixture business, died in Chicago, Dec. 26 at the age of 79. He learned the metal spinning trade in Württemberg and came to America in 1866 and to Chicago in 1874. In 1889 the David J. Braun Mfg. Co. was incorporated and later consolidated with the Beardslee Chandelier Mfg. Co., and was the first factory in Chicago for manufacturing lighting fixtures.

The David J. Joseph Co., Cincinnati, dealer in waste material, has increased its capitalization by the issue of \$500,000 preferred stock, which has been fully subscribed. This makes the capitalization of the company \$1,250,000, of which \$750,000 is common stock. This company, which was organized one year ago, during the year opened yards at Chicago and St. Louis and has also opened an office in Pittsburgh. The increased capitalization will be used in further extending its operations.

Navy Sells 13 Vessels

Bids to be submitted for the several battleships and monitors this month may be influenced by prices at which the Navy Department last week sold 13 vessels of different types, the largest being the triple-screw cruiser Brooklyn, at Mare Island, Cal., appraised at \$200,000 and sold to the American Iron & Metal Co. of California, for \$46,667. These vessels, however, are smaller than the battleships and monitors to be sold and will not prove to be so great a task in dismantling as the heavier armored battleships will. Among other ships sold, the prices they brought and their appraised values, follow:

Vessel	Price	Appraisal	Buyer
Transport Astoria, at Boston	\$30,500	\$130,000	Richard T. Green Co., Chelsea, Mass.
Yacht Vega, at Philadelphia	10,000	102,000	C. H. Crocker, San Francisco
Lighter 160, at Mare Island	5,725	12,000	Hunt, Hach & Co., Oakland, Cal.
Training ship Intrepid, at Mare Island....	4,015	20,000	M. Parker, San Francisco
Yacht Galatea, at Portsmouth, N. H.	4,400	116,000	A. A. Tanos, New York
Destroyer Smith, at Philadelphia	6,176	7,000	Jos. G. Hitner Sons Co., Philadelphia
Eagle No. 25, at Philadelphia	1,026	5,000	Jos. G. Hitner Sons Co., Philadelphia

The list on which bids are to be received Jan. 16 includes the battleships Maine, Missouri and Wisconsin at Philadelphia, each appraised at \$120,000; the monitors Puritan and Miantonomah, at Norfolk, Va., and the Ozark and Tonopah, at Philadelphia; the wrecked cruiser Memphis, at Santo Domingo and the triple-screw cruiser Columbia, at Philadelphia, appraised at \$300,000. The monitors are appraised at from \$4,000 to \$40,000.

Bourne-Fuller Plant Resumes

Describing its action as an experiment towards improving industrial conditions the Bourne-Fuller Co., Cleveland, resumed operations on its Upson Nut steel plant and blast furnace Jan. 3. The blooming mill and three of the five open-hearth furnaces will be operated. The finishing mills will be run to fill orders as received. Surplus steel beyond requirements of the finishing mills will be stored in semi-finished form. The company's stack has been out of blast since last January and its open-hearth department was operated only four months last year.

The employees expressed a willingness to take a cut in wages rather than to remain longer out of work and a flat reduction of 15 per cent was made. This places common labor on the basis of 25½c. per hour. The company promised its employees that it would keep the plant in operation three months and hopes by the expiration of that time business will have improved sufficiently to permit it to continue operations.

Inquiries for Coke

UNIONTOWN, PA., Jan. 3.—The new year is being ushered in in the Connellsville bituminous region with first inquiries for coke tonnage for the first half of the year. Only one contract is reported so far and that semi-officially. It is to the effect that an Eastern steel company has contracted for 7,500 tons of furnace coke monthly for three months at \$3 a ton.

Output in the region has fallen off slightly during the past two weeks.

Investigations on the carbonization of lignite have been under way for some time under the direction of Dr. E. J. Babcock, dean of the mining engineering department of the University of North Dakota. In a bulletin of the Bureau of Mines, W. W. Odell, fuel engineer of the bureau, gives preliminary information, including a sketch of the carbonizer employed. Twenty tons of raw lignite were carbonized per day and by-products are recovered. The briquetting equipment rolls pillow-shaped briquets weighing approximately 2¼ oz. each.

Iron and Steel Markets

(Continued from page 127)

roads features the iron and steel market. The Alabama, Tennessee & Northern Railroad has placed an order with the Mount Vernon (Ill.) Car Co. for 250 gondola cars and 50 sets of steel underframes for cars. The Missouri Pacific has an inquiry out for 100 wheels, and the Wabash wants a quantity of boiler tubes—about 100 tons being involved. The Missouri, Kansas & Texas Railroad will shortly start work on new freight terminals at Denison, Tex., the biggest part of the work being the laying of approximately 30 miles of track, for which 85 lb. relaying rails already on hand will be used. Distributors are buying heavily of pipe for use in the oil fields at Mexia, Texas.

For stock out of warehouse we quote: Soft steel bars, per lb. iron bars, 2.77½c.; structural shapes, 2.87½c.; tank plates, 2.87½c.; No. 10 blue annealed sheets, 3.17½c. No. 28 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 5.65c.; structural rivets, \$3.32½ per 100 lb.; boiler rivets, \$3.62½; tank rivets, 7.16 in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 16 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-5 per cent; hot pressed nuts, square or hexagon blank, \$4, and tapped, \$3.75 off list.

Old Material.—The market for old material remains very weak, and continues to drag, although prices have changed very little. There has been a consumptive buying. A few transactions between dealers are reported, where contracts expiring and deliveries must be made before the end of the year. Inquiries for relaying rails are picking up, and it is reported that some good-sized contracts will be closed early in January. Current railroad offerings include: Missouri, Kansas & Texas, 1250 tons; Pennsylvania System (Southwestern Region) 4100 tons; Louisville, Henderson and St. Louis, 500 tons; Baltimore & Ohio, 11,000 tons and an open list issued by the New York Central.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton	
Iron rails	\$15.50 to \$16.00
Steel rails, rerolling	12.00 to 12.50
Steel rails, less than 3 ft.	12.00 to 12.50
Relaying rails, standard section	23.00 to 28.00
Cast iron car wheels	15.00 to 15.50
No. 1 heavy railroad melting steel	11.00 to 11.50
No. 1 heavy shoveling steel	10.50 to 11.00
Ordinary shoveling steel	10.00 to 10.50
Frogs, switches and guards cut apart	11.00 to 11.50
Ordinary bundle sheet	4.50 to 5.00
Per Net Ton	
Heavy axles and tire turnings	\$5.50 to \$6.00
Iron angle bars	13.50 to 14.00
Steel angle bars	10.00 to 10.50
Iron car axles	18.00 to 18.50
Steel car axles	13.50 to 14.00
Wrought iron arch bars and transoms	13.50 to 14.00
No. 1 railroad wrought	9.50 to 10.00
No. 2 railroad wrought	8.50 to 9.00
Railroad springs	11.50 to 12.00
Steel couplers and knuckles	11.50 to 12.00
Locomotive tire, 42 in. and over, smooth inside	8.50 to 9.00
No. 1 dealers' forge	7.50 to 8.00
Cast iron borings	6.00 to 6.50
No. 1 bushing	9.00 to 9.50
No. 1 boilers cut in sheets and rings	7.50 to 8.00
No. 1 railroad cast	13.50 to 14.00
Stove plate and light cast	12.00 to 12.50
Railroad malleable	9.50 to 10.00
Agricultural malleable	9.00 to 9.50
Pipes and flues	7.50 to 8.00
Heavy railroad sheet and tank	6.50 to 7.00
Light railroad sheet	4.50 to 5.00
Railroad grate bars	9.50 to 10.00
Machine shop turnings	5.00 to 5.50
Country mixed iron	7.00 to 7.50
Uncut railroad mixed	7.50 to 8.00
Horseshoes	10.00 to 10.50
Railroad brake shoes	9.50 to 10.00

Leonard Kennedy & Co., 67 Wall Street, New York, have not purchased machinery against their contract for removing a hill in Rio de Janeiro, Brazil. They are now negotiating for hydraulic equipment, including motors, pumps, flumes, etc., and will probably begin work about May. At present, the hill is being removed by hand, the method of the former Brazilian contractor.

British Iron and Steel Markets

Falling and Selling Prices Getting Nearer Continental Prices—Naval Contracts Abandoned

(By Cable)

LONDON, ENGLAND, Jan. 3.

There is more inquiry for pig iron; but the reductions in English and Welsh railroad rates was disappointing, amounting to only 1s. (21c.) on pig iron. Scottish railroads refuse any concession. Cheaper pig iron is expected shortly, as makers desire to get more furnaces to blowing.

Improved demand for hematite is in evidence, but the output is adequate to take care of it. Foreign ore is duller; freight charges from Bilbao to Middlesbrough are easier. The best Rubio ore is quoted at 26s. (\$5.46) c.i.f. Tees.

Some Northeastern steel works are resuming operations this week; but the Scotch steel plants remain closed, probably for fourteen days. The position is brighter, for costs are falling and selling prices are more nearly approaching those for Continental materials. Steel beams are now sold at from £8 to £8 5s. (1.50 to 1.55c. per lb.) f.o.b.; boiler plates, to Lloyds' test, have been done at £12 10s. (2.34c. per lb.) f.o.b.

Guest, Keen & Nettlefolds, Ltd., proposes to electrify the entire Dowlais works. Vickers and Armstrong interests are negotiating for the purchase of the Woelkersdorf arsenal. The Forth Shipbuilding & Engineering Co. has registered its nominal capital at £315,000 [previously £300,000].

Continental business is quiet. Belgian beams are being sold at £7 10s. (1.41c. per lb.) f.o.b.; Belgian merchant bars at £7 12½s. to £7 15s. (1.43 to 1.45c. per lb.) f.o.b., for January and February shipment. French merchant bars are held at £8 (1.50c. per lb.) f.o.b., for January and February. Belgian plates are quoted up to £10 (1.87½c. per lb.) f.o.b. for quick shipment. German rods are being sold at £8 10s. (1.59c. per lb.) f.o.b. for shipment in first quarter. No. 3 Belgian bar iron is quoted at £9 15s. (1.83c. per lb.) delivered to the Midlands.

Tin plate outlook is disappointing. Prices are easier, January shipment being sold at 19½s. (\$4.15) basis f.o.b. Prompt 28 x 20 in. sizes are offered at 40s. (\$8.40) f.o.b. The export demand is quiet. Wasters are weaker; quarters are offered at 20s. (\$4.20) f.o.b., ex-stock. Twenty x 14's are quoted at 19s. (\$3.99) f.o.b.

Galvanized sheets are weak and some makers are considering closing down. Black sheets are easier, Japanese specifications being offered at £17 10s. (3.28c. per lb.) f.o.b., without response.

We quote gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$4.20 per £1 as follows:

Durham coke, delivered	£1 8½ to £1 10	\$5.98 to \$6.30
Cleveland No. 1 foundry	5 5 & 5 10*	22.05 & 23.10*
Cleveland No. 3 foundry	5 0 & 5 5*	21.00 & 22.05*
Cleveland No. 4 foundry	4 15	19.95
Cleveland No. 4 forge	4 10	18.90
Hematite	7 0*	29.40*
East Coast mixed	5 0 & 5 2½*	21.00 & 21.52*
Ferromanganese	15 0 & 14 10*	63.00 & 60.90*
Rails, 60 lb. and up	8 10 to 9 10	35.70 to 39.90
Billets	8 0 to 8 5	33.60 to 34.65
Sheet and tin plate bars, Welsh	7 15	32.55
Tin plate, base box	0 19¼ to 1 0¼	4.04 to 4.25
C. per lb.		
Ship plates	9 10 to 10 10	1.78 to 1.97
Boiler plates	14 0 to 14 10	2.62 to 2.72
Tees	10 0 to 11 0	1.87 to 2.06
Channels	9 5 to 10 15	1.73 to 2.02

Machine Tool Industry Had a Poor Year

Industry Has Not Suffered So Greatly Because of Lack of Orders
in Any Previous Business Depression

AT least it can be said that the machine-tool industry enters upon the New Year with much better prospects than it faced a year ago. Then the business depression had barely set in. Now a whole year of readjustment of selling prices, production costs and other factors entering into the situation has gone by and the mood of buyers is of a much more encouraging character. Aside from the fact that the need of machine tools by metalworking industries was at low ebb the past year because of lack of work, the great number of new and used machines offered for sale at "bargain" prices, most of them leftovers from the war, cut a deep hole in the business which the machine-tool builders might otherwise have got. Many of the machine-tool plants received so little business during a part of the year that their plants were wholly or partially shut down for weeks or months at a time. Many of the tools owned by the War Department, which inventoried at millions of dollars, have been turned over to vocational training schools and thus are eliminated as a factor in the market. Stocks still held by Government departments are relatively unimportant.

Railroad Buying the Hope of Eastern Machine-Tool Trade

OWING to the lack of work among metalworking industries and to the retrenchment policies of most of the large manufacturing companies in the East, the year 1921 was a very poor one with machine-tool sellers in the New York market. Most of the large plants in the East, in common with those elsewhere in the country, were left with large stocks of machine-tool on their hands when the slump in business set in, and many of them became sellers, rather than buyers, of tools. Those which really needed new shop equipment were hesitant about buying in the early part of the year because of the possibility of price reductions, and when these reductions finally came, affecting almost every make of machine tool, they still hesitated on the theory that the liquidation of prices had barely begun. Much of the buying was confined to single machines urgently needed, and there was a great deal of "bargain hunting."

Many used machines in good condition were offered for sale, and in addition there was a considerable number of new machines, which were sold at "second-hand" prices, to attract business away from the regular manufacturing companies.

Price readjustments during the year were many and sweeping, and while prices have not gone back fully to the 1914 level, they are not far out of line when present higher labor costs and higher costs of material, transportation, etc., are taken into consideration.

The first half of the year was uneventful so far as

important business is concerned. Nor was the last half of the year active, though an improvement was noted beginning in August or September. Sales in October reached a fair volume in comparison with the low sales records of earlier months of the year.

The trade was buoyed up by hopes of railroad buying when inquiries began to make their appearance in the fall. The Delaware, Lackawanna & Western issued an inquiry for about 40 machines early in October. The Erie inquired for 64 machines in November, and eventually purchased a part of this list, filling its requirements, however, largely with used tools. The American Locomotive Co. inquired for 35 machines in late November and purchased the entire lot, this constituting probably the largest single piece of machine-tool business completed in the New York district within the year.

Other railroad inquiries have been issued, but action was deferred. The Chesapeake & Ohio took bids on about \$100,000 worth of shop equipment, but has not yet bought. The Delaware & Hudson recently issued a small list.

While the trade looks for no marked revival of machine-tool buying early in 1922, the prospects are better than were faced a year ago. Usually among the first to feel the effects of a depression, the machine-tool industry is also usually the last to recover. It is now awaiting a more general recovery of business activity as a prelude to better buying of its products.

Chicago Machine Tool Market Dull in 1921

MACHINE-TOOL buying was exceptionally light in the Chicago district in 1921. In fact, representative dealers estimate that their total sales for the year will not exceed 20 or 25 per cent of those of 1920. Agricultural implement manufacturers bought practically nothing; the automotive industry purchased little, and industrial plants as a whole made few additions to their equipment during the year. While railroad purchases stood out in bold relief because of their size, they were few in number and in the aggregate represented a much smaller outlay than their expenditures for tools in the preceding year. Although it cannot be said that there was active buying by any class of users, purchases by schools, motor service stations and small manufacturers of dwelling house appurtenances were notable in a dull market.

Prices of machine tools declined during the course of the year. In January two makes of engine lathes were reduced 7½ and 10 per cent, respectively. In January and February, several manufacturers of shapers announced cuts of 15 per cent. In February and March, milling machines went down an average

of 15 per cent. On April 1, the leading lines of planers, engine lathes and radial drills were reduced 10 per cent. In August milling machines were again reduced 10 to 15 per cent and in October engine lathes, radial drills and shapers were again cut 10 to 15 per cent. Similar reductions in other types of tools were made throughout the year.

Notwithstanding price reductions, the sale of new equipment was impeded by offerings of second-hand tools. Numerous auctions of the stocks of bankrupt manufacturers threw considerable used equipment on the market at low prices. The absorption of these tools, in part, accounts for the small sales of new equipment throughout the year. In some cases, buyers showed no interest in new machines and covered their entire requirements by purchasing second hand tools. Thus \$250,000 worth of used equipment was bought for a new Minneapolis plant which went into the manufacture of automotive replacement parts.

The outstanding purchase of new equipment in the first half of the year was that of the Atchison, Topeka & Santa Fe R. R., which bought \$125,000 worth

of tools for its Albuquerque, N. M., shops. This list brought out concessions of 10 per cent or more under the then prevailing prices. During April and May small sales to automobile manufacturers were recorded, evidently reflecting the seasonal revival in that industry. In June the Great Northern R. R. closed for \$25,000 worth of equipment, and toward the end of July the Illinois Central bought \$150,000 worth of tools at sharp concessions. No further buying of consequence occurred until October and November, when additional railroad business was closed. The Virginian placed orders for \$20,000 worth, while the Missouri, Kansas & Texas closed for a list of 86 tools. The Santa Fe also bought a few additional items, including

an axle lathe, a 1500-lb. steam hammer and a number of sheet metal working machines. The Hurley Machine Co., manufacturer of washing machines, Chicago, bought 15 power presses representing a total outlay of \$20,000. Another order taken in the Chicago district toward the close of the year covered complete equipment for a plant of the Richmond Car Co., Inc., Richmond, Va.

Throughout the year, inquiries were repeatedly issued and withdrawn. This was particularly true of railroad lists. The Santa Fe and the Illinois Central bought only after much delay, whereas the Rock Island, which has had a list before the trade most of the past year, has not yet bought.

New England Machine Tool Market for 1921

CONSERVATIVE estimates place sales of new machine tools in New England during 1921 at approximately 12½ per cent of those for 1920. In other words, sales probably have not amounted to much more than \$500,000, whereas, in 1921 they easily amounted to \$4,000,000. This percentage is based on dollars and cents alone. When the number of individual tools sold is taken into consideration, the showing is not so poor. The unfavorable showing is due more to the price situation than to actual consumption.

Of the new machines sold this year, the textile machinery makers and allied interests have been by far the heaviest buyers both from the number of individual tools and price standpoints. Educational institutions have been market factors, but the purchase of approximately \$30,000 new metal working equipment by a Connecticut maker of ship engines probably constitutes the most notable exception to textile machinery buying. Included in the estimated sales of \$500,000 are cranes. In fact, the crane market has been a considerable factor in pulling up sales to that basis. Power house cranes have dominated the market.

A miscellaneous assortment of machine tools has been purchased. February generally is conceded to be

the low sales point of the year. The next low point was August, but sales in that month did not fall as low as in February. Since August the trend of business has been upward; consequently, that month is generally spoken of as the low point of the year. The upswing since August has been very slow, but sufficient to lend considerable encouragement to manufacturer and seller of machine tools.

The outlook for 1922 is for further improvement. Machine tool interests look for other than textile machinery makers to come into the market, and indications are the New England railroads will buy some badly needed equipment.

The number of used machine tools sold here during 1921 is much larger than the new, but here again the price situation has made for an unprofitable year. In 1920 the used machinery market had Government supplies to draw upon. Such supplies were practically eliminated during the early part of 1921, but a new supply—bankrupt manufacturers'—soon developed. The new supply dwindled to small proportions during the last quarter of 1921, and, as a result, the used tool market has been thoroughly cleaned up on several lines of machines.

Cleveland Machine Tool Market

WITH the buying of machinery at low ebb, the machine tool industry in Cleveland experienced its worst year during 1921. For a number of years, leaving out of consideration the unusual demand during the war-time period, the automobile industry had been the main source of the machine tool business in the Central West and during some otherwise dull periods the demand from this field held up well and furnished the backbone of activity. With the reaction following the tremendous plant extension of automobile companies in 1920, sales of machinery to motor car builders came almost to a stop. Some orders were placed by automobile plants during the year, but these were almost wholly for improved tools for replacements to cut down production costs. These orders were for single machines, or at the most small lots. In no case was there any buying in round lots to increase production. Late in the year, there was a little more activity in the automobile field owing to purchases by one or two new companies that were preparing to equip motor car plants.

Makers of automobile parts and accessories bought some machinery during the early part of the year, the demand from this source being better than from the motor car companies. Another allied industry, the tire making industry, had been for several years a good source for machinery orders, particularly for equipment for making tire molds, but the capacity of the tire making plants had been extended to beyond the country's consuming capacity for the output, so that virtually no machinery was purchased during 1921 by either the Akron tire makers or the foundries and machine shops that specialize on tire molds. Other industries did little buying during the year as in most metal working lines, plant capacities had been greatly increased and with plant operations sharply reduced,

there were few shops that did not have a great deal of idle machinery.

The machine tool business showed some revival during the last two or three months of the year, but orders, as earlier in the year, were mostly for single machines. Throughout the year large industrial companies as a rule kept out of the market, the bulk of the business coming from small shops. Railroads in the Cleveland territory bought scarcely any machinery during the year, but the improved demand from railroads in other sections brought a few orders late in the year to Cleveland machine tool builders. There was very little building of industrial plants in the Central West during the year and consequently, the demand for equipment for new shops was negligible. A bright spot in the market was the development of some demand for machinery for equipping manual training schools, several of which were built recently in industrial centers.

Foundry operations in Ohio were down to 25 per cent or less of capacity during the year and very few orders were placed by foundries for either machine tools, molding machines or other equipment. Machinery orders come in goodly numbers from steel plants when conditions are normal, but there was virtually no demand from this source during the year.

The price situation was an important factor in the market during the early part of the year. Some buyers withheld orders, waiting for lower prices, but the prediction that lower prices would not stimulate sales apparently proved true.

Probably the predominating feature in the machinery market during the year was the large amount of used machinery offered. This began to come out early in the year when considerable machinery purchased during the previous year was placed on the market. By the time this machinery was delivered, it

was not needed, as the business slump had come and considerable of this machinery had not been uncrated. Later, other surplus machinery was dumped on the market by automobile companies that were curtailing capacities and by plants in other fields. Equipment of small plants that had gone out of business with the depression added to the total. Late in the year, the General Motors Corporation gathered up in Detroit 1500 used machines from its various plants and placed them on the market. The demand for used machinery appeared better during the year than for new tools,

this being due to the general policy of buyers to keep their investments for equipment down as low as possible. However, the used machinery moved slowly, as it was offered faster than it could be absorbed.

Early in the year, Cleveland machine tool builders kept their plants in fair operation, building machines for stock, but when they had accumulated good sized stocks and the expected revival of business had not appeared, they either cut production way down or in some cases shut their plants down entirely. Some of these have fairly large stocks on hand at present.

The Machine Tool Industry of Cincinnati

THE machine tool industry in Cincinnati during 1921 experienced probably the duller year in a decade. Practically all of the manufacturing plants were closed for the greater part of the year, although a few managed to keep running with a skeleton of their normal force. While this condition was common throughout the country, Cincinnati, which is the center of the industry, was probably harder hit than any other section. Some of the smaller shops were able to run for several months in the early part of the year, but taking the 12 month period, it is doubtful whether the average operation in the industry was 15 per cent as compared with what might be considered a normal period.

The year opened with virtually all of the shops closed, but during the early months of the year some of these were re-opened with a greatly reduced force and a shorter schedule of working hours. In January a small volume of export inquiries appeared, but with the exception of some South American business, very few orders were placed. Reduction in wages in the industry made it possible for some of the shops to keep running, making up stock. During the month of February, however, business was very quiet and plants which had been running on reduced schedules were shut down entirely. In the early part of March, machine tool prices were cut approximately 10 to 15 per cent. In this month, some buying developed, principally by the Santa Fe Railroad and the Japanese Government. In the latter part of the month, conditions were somewhat improved and some export orders were placed. Lathe manufacturers made a cut in prices and this was followed by some reinstatement of old orders. Early in April, German manufacturers were offering machine tools and machine tool supplies

in this country at very low prices, but such was the state of industry in general that no records of orders being placed were available. From April to June the machine tool business was very quiet, although during the month of May the Big Four Railroad issued an inquiry for \$80,000 worth of tools. The month of June was the best so far this year but in July orders were very scarce and practically all of the shops were again closed down.

Along toward the middle of August a slight improvement was noticed, the automobile industry showing some activity. In September a number of shops which had been closed for several months opened up with small forces. From then until the close of the year a gradual improvement was noticed and although the orders were small, nevertheless they were such as to give encouragement to the manufacturers. During this period, some fair sized orders were placed, chief among them being approximately \$75,000 worth of tools for the Big Four Railroad, 10 machines for the Virginian Railway and about 70 tools for the M. K. & T. Railroad. The International Nickel Co. was also a fair buyer, and several fairly large orders were booked for export to Cuba and South America.

During the closing months of the year, the complexion of the inquiries was greatly improved, giving rise to the hope that next year will probably be a much better one for the machine tool manufacturers. Orders booked during the last three months were also greater in number and altogether the indications point to a better business in 1922 than was had during 1921. Stocks in manufacturers' hands are being steadily, though slowly, disposed of and the great majority of the plants have very few tools available for immediate delivery.

Hopes Not Realized at Pittsburgh

THE story of the machinery and machine tool markets in Pittsburgh in 1921 is one of hope deferred. It was such a lean year in the steel and allied industries, to which the machinery trade looks largely for business in this district, as regards business and a losing one so far as profits are concerned, that while a good many inquiries came out for equipment, actual orders were relatively few and a good many projects, against which quotations went in early in the year, still were only prospects at the close of the year. The largest piece of business placed during the year was for the new plant of the International Nickel Co., Huntington, W. Va. For this plant 10 cranes of capacities varying from 5 to 10 tons were placed, the order going to Manning Maxwell & Moore, distributors of the Shaw crane. The merchant mills, 7 in number, for this plant were awarded to the United Engineering & Foundry Co., Pittsburgh, and a 30-in. sheet mill and a 26-in. cold mill went to the Standard Engineering Works, Ellwood City, Pa.; Chambersburg Engineering Works and the Massillon Foundry & Machine Co. divided an order for 4 hammers; Allis-Chalmers Mfg. Co. was awarded motors and controllers for 30-in. sheet mill, 26-in. cold mill, 24-in., 20-in., 14-in. and 9-in. merchant mills, the Westinghouse Electric & Mfg. Co. a variable speed set to drive the 9-in. and 10-in. merchant mills and the General Electric Co. the transformers, the motor-generator set and the main switch

board. The Mesta Machine Co. was the successful bidder for the mill drives, one of 1200 hp. for the 30-in. sheet mill, one of 300 hp. for the 26-in. cold mill, one of 1200 hp. for the 24-in. billet mill, one of 1100 hp. for the 20-in. bar mill, one of 800 hp. for the 14-in. merchant mill and three of 500 hp. for the 10-in. merchant mill, the 9-in. rod mill and the 9-in. wire mill. Two tilting tables and three roll lathes were placed with the United Engineering & Foundry Co.

Otherwise the business of the year was of such equipment as was absolutely needed and then largely for replacement. There was so much uncertainty to prices that those projecting new plants or extensions requiring tools or machinery were encouraged to delay. Price reductions were frequent by machine tool manufacturers during the first half of the year and though public announcements were lacking during the last half, the market remained in buyers' favor, due to the fact that there was not enough business to go around and competition was keen for passing business. Builders of cranes, mills and heavy equipment generally, have had to pare prices pretty sharply to secure business lately. Crane prices which prior to the war averaged a little less than 10c. per lb. and during the war and the post-war boom of 1920 went above 20c. per lb. now are back at about 10c. per lb. on the basis of prices which have leaked out on some recent awards. Incidentally, as bearing on the future demand for

cranes and parts from steel manufacturers, some now are building their own. On all recent purchases made by the Carnegie Steel Co. the manufacturer has been obliged to furnish blueprints of the crane and parts

and there is now more than one crane in use by this company which it has built itself. Railroad buying has been practically nil in the Pittsburgh district the past year.

The Week's Market

New York

NEW YORK, Jan. 3.

Late last week the purchasing department of the Delaware, Lackawanna & Western Railroad began calling to its offices the representatives of machine-tool builders preparatory to placing orders against its recent list of about 40 machines. It is expected that all of its business will be placed this week. The Seaboard Air Line last week bought about \$30,000 worth of machine tools, most of the business going to one New York company which specializes in railroad tools. Two turret lathes were ordered from a Cleveland builder.

The last week of 1921 was otherwise dull, but prospects were somewhat improved. A better demand for turret lathes is in evidence, one company's December business in this district having shown quite a marked improvement.

The crane market in this section was featureless the past week. The 34 gantry cranes for the New York City piers at Stapleton, S. I., were awarded to the Wellman-Seaver-Morgan Co., low bidders on the second bidding, with a price of \$276,268. On the other three items of the tender the following awards were made, based on the first bids submitted: B. Gurney Elevator Co., 300 Eighth Avenue, New York; C. Watson Flagg Engineering Co., 123 Liberty Street, New York, electric power wiring; D. Shevlin Engineering Co., 110 West Thirty-fourth Street, steam-heating equipment. The H. S. Jones Building Co., 280 Madison Avenue, New York, holding a contract for construction work awarded by the Passaic Valley Sewage Commission, has purchased a 15-ton hand power crane from the New Jersey Foundry & Machine Co., which was the low bidder on a recent inquiry. The Coleman-Shoemaker Co., Philadelphia, recently in the market for a 10-ton, 28-ft. span hand power crane, has purchased. The West Jersey Supply & Sand Corporation, Beach & Marlborough streets, Philadelphia, has purchased a 25-ton Orton & Steinbrenner locomotive crane.

The Warner-Quinlan Co., 79 Wall Street, New York, has awarded contract to the John W. Ferguson Co., Paterson, N. J., for eight fireproof buildings at Linden, N. J., to replace its asphalt manufacturing plant, recently destroyed by fire with loss estimated at close to \$1,500,000. The work will include a power plant, machine repair shop and other works buildings. The Hammond Iron Works, Warren, Pa., has received a contract for steel tanks at the new plant, which is estimated to cost about \$1,000,000, including machinery. The Gifford, Huntz, Baker Engineering Corporation, 40 Rector Street, New York, is engineer.

The New York Central Railroad Co., Grand Central Terminal, New York, has plans nearing completion for enlargement of its car repair shops at West Albany, N. Y. The work will be carried out in connection with a \$20,000,000 expansion and improvement program in this section.

The Muggers Iron Works, Inc., 796 East 133rd Street, New York, will build a one-story addition, 50 x 105 ft. Plans have been filed.

A vocational department will be installed in the two-story high school to be erected by the Board of Education, Maybrook School District, Maybrook, N. Y., estimated to cost about \$110,000. Frederick Elcholtz is president of the board. H. T. Blanchard, 137 East Forty-sixth Street, New York, is architect.

The Gresser Knitting Machine Co., 260 West Broadway, New York, manufacturer of knitting machinery and parts, has leased the eight-story factory at 248-50 West Broadway, totaling about 38,000 sq. ft., for a new plant. The present works will be removed to this location.

The New York Edison Co., Irving Place and Fifteenth Street, New York, will commence the immediate erection of a two-story power house, 38 x 126 ft., at Park Avenue and 188th Street, estimated to cost about \$75,000.

The Board of Aldermen, New York, has approved an appropriation of \$900,000 for a new pier on the North River, replacing Pier No. 32. The Department of Docks, Municipal Building, will be in charge.

A one-story power house will be erected by the St. Joseph's Infant Home, Green Street, Utica, N. Y., in connection with a new mechanical laundry building, estimated to cost about \$45,000.

The Manhattan Roofing Co., 133 East 118th Street, New

York, has acquired the building now occupied and plans the erection of a new six-story structure for general expansion.

The A. A. Garage, Inc., has leased a two-story building on Avenue A, between Sixtieth and Sixty-first Street, New York, for an automobile service and repair works. C. R. Warren and H. Williams head the company.

The American Insulation Co., 9 New Jersey Railroad Avenue, Newark, N. J., manufacturer of roofing, etc., with headquarters at Roberts and Stokely streets, Philadelphia, has leased the one-story building at 128-34 Jackson Street, and will remove its local works to this location. The property is owned by the Bassick Co., Bridgeport, Conn., manufacturer of casters, etc.

The Wittemann Aircraft Corporation, Hasbrouck Heights, N. J., and other airplane manufacturing interests, are negotiating with the Department of Streets and Public Improvements, Newark, for a site at Port Newark, for the establishment of a plant to manufacture aeroplanes and other aircraft and parts. As projected the plant will cost in excess of \$1,000,000. Paul Wittemann is head of the company.

The Central Ice & Cold Storage Co., Vineland, N. J., has completed plans and will soon break ground for a new one-story ice-manufacturing plant at Sixth and Pear streets, estimated to cost about \$250,000, including machinery. A. L. Williams is president.

The Borough Council, Butler, N. J., has disposed of a bond issue of \$76,700, for the construction of an addition to the municipal electric power plant.

The Somerset Electric Co., Morristown, N. J., will acquire and merge the plants and properties of the United Electric Co., and the Roonton Electric Co., Boonton, N. J., and has issued a bond issue of \$450,000 for this purpose. It is proposed to make improvements and extensions in the present plants and system.

New England

BOSTON, Jan. 2.

The final week of 1921 was quiet in the local machine-tool market. Anticipated closing on crane business did not materialize, being put off for another week or ten days. Three or four houses monopolized the business which appeared and about 30 per cent of the equipment purchased was used machinery. Sales for the week include a 20-in. lathe and a 20-in. planer, both used tools, to a Weirs, N. H., consumer; a new Garvin screw slotter, to a Bangor manufacturer; a 28-in. used Prentice drill, and a used 7500-lb. hammer to a local street railroad company; a used Brown & Sharpe vertical milling machine and other equipment to a Lowell textile machinery maker. A small amount of export business was put through for Cuba, including a used 24 x 24-in. x 6 ft. planer, a 9-in. x 4 ft. Seneca Mills lathe and miscellaneous used equipment. The L. B. Smith Co., 11 and Fourth streets, South Boston, silversmiths, is in the market for fairly heavy press equipment, either new or used. About the only other new business to develop is an inquiry for two large back geared lathes and several less expensive turning tools.

A number of old prospects, considered more or less uncertain have become active once more, one involving approximately \$20,000 worth of presses and another a moderately large list of shop equipment for a New England street railroad company. With the revival of such prospects, added to those considered alive, local machine tool houses are confident good bookings will be made in January and February. Dealers in most other sections of New England are less hopeful, although in Providence the outlook for used tools, at least, is looked upon as encouraging. No changes in prices are reported this week. The local trade, however, anticipates some adjustments within the next fortnight.

The Gilbert & Barker Mfg. Co., Springfield, Mass., tanks, etc. contemplates additions, but details have not been worked out.

The Gilbert & Barker Mfg. Co., Springfield, Mass., tanks, Haven, Conn., plans the erection of a one-story factory, 140 x 160 ft., to cost approximately \$100,000.

In the interest of economy, the Hill plant, Springfield Armory, Springfield, Mass., is to be abandoned by the

Government as a manufacturing unit and will be leased to outside interests.

The Textile Finishing Machinery Co., 171 Westminster Street, Providence, R. I., will commence the immediate erection of its proposed plant on Harris Avenue, consisting of two buildings, one of which will be equipped as a machine shop.

The Segal Metal Products Co., Springdale, Stamford, Conn., is planning to rebuild the portion of its plant, destroyed by fire, Dec. 21, with loss reported at about \$15,000. The structure had been occupied only about a week by the Segal company for the manufacture of locks and kindred specialties.

The Conaery Machine & Tool Co., Springfield, Mass., has preliminary plans under way for a new one-story plant, 50 x 150 ft., on property recently acquired on Flisk Avenue.

The Builders' Iron & Steel Co., 262 Bridge Street, Everett, Mass., has work under way on the superstructure for its new one-story plant, 25 x 70 ft., estimated to cost about \$65,000.

The Robert M. Keating Co., Springfield, Mass., is arranging for the manufacture of an improved type of flush valve on a quantity basis at its plant at an early date. Tools and equipment for the production are now being developed.

John McGann and Raymond Handrahan, Waltham, Mass., have acquired a building at Charles and Harvard streets, for the establishment of a machine repair works, primarily for automotive service.

Chicago

CHICAGO, Jan. 3.

A little business was closed between the holidays but if all users who have promised to take action on their needs after the first of the year actually make purchases, the coming month should be an active one. Not only the railroads, but miscellaneous users, have indicated that they expect to buy equipment. Among the railroads the Santa Fe and the Rock Island are regarded as most likely to place their requirements in the near future. The Union Pacific which was reported to have prepared an extensive list has thus far merely asked for quotations for the purpose of preparing a 1922 budget. The Burlington is preparing to enter the market for extensive needs, the most important of which will be the requirements of a new shop to be built near Denver for the Colorado & Southern, its subsidiary.

The Growolz Artificial Ice Co., 1018 South Hamilton Avenue, Chicago, has secured a permit for the construction of a one-story plant, 124 x 165 ft., at 3916-28 W. Harrison Street, to cost \$36,000.

The Great Northern Railway Co., St. Paul, F. A. Bushnell, purchasing agent, is inquiring for a Niagara 12-ft. squaring shear and a Chicago 12-ft. brake, but bids on competitive machines are invited.

The construction of a plant of the American Locomotive Co. at Granite City, Ill., is believed to be imminent, as temporary structures for engineers in charge of design and construction are now being erected on the company's property in that city.

The Nelson Knitting Co., 660 South Wyman Street, Rockford, Ill., plans to construct a three-story knitting factory on Kent Street near Church Street, at a cost of \$75,000.

The Globe Portland Cement Co. has let a contract for a large cement plant at Dubuque, Iowa, at a reported cost of \$2,000,000.

The Monticello Tire & Rubber Co., Monticello, Iowa, is constructing a 60 x 190-ft. tire plant to cost \$20,000.

The Henry Artificial Ice Co., Henry, Ill., is having plans prepared for a one-story artificial ice plant to cost \$30,000.

Temporary repairs have been made to the plant of the West Michigan Steel Foundry Co., Muskegon, Mich., which was damaged by fire Dec. 14. Permanent repairs will not be made until next spring. The fire loss totaled \$28,000, of which \$11,000 was in the structure, and \$17,000 in equipment and supplies.

The Haskell & Barker Car Co., Michigan City, Ind., has taken bids on a foundry addition.

The J. A. Huetter Machine Co., 545 Kentucky Avenue, Indianapolis, is preparing plans for a one-story machine shop, 55 x 85 ft., to cost \$25,000.

C. A. Starr, 137 Park Place, Decatur, Ill., plans to construct a one-story automobile repair shop, 75 x 162 ft., to cost \$40,000.

G. C. Brown and W. C. Gridley, 1826 Hoffman Boulevard, Rockford, Ill., are having plans drawn for a one-story garage,

60 x 145 ft., a repair shop, 35 x 90 ft., and a boiler plant, 20 x 30 ft., on Auburn Avenue, to cost \$75,000.

The Oetting Brothers Ice Co., 1725 West Fifteenth Street, Chicago, is taking bids for a new two-story and basement plant, 80 x 180 ft., on Fifteenth Street. Edward G. McClellan, 7441 Cottage Grove Avenue, is architect.

The Pratt Brothers Mining Co., Herrin, Ill., operating the Jeffrey mine, is considering the rebuilding of the tippie at its property, recently destroyed by fire.

Fire, Dec. 24, destroyed the plant of the Teetoe Adding Machine Co., occupying the larger portion of a five-story building, with loss reported in excess of \$500,000, including machinery.

The Great Northern Power Co., Duluth, Minn., is considering the construction of a new hydroelectric generating plant in the vicinity of Fond du Lac, Minn., estimated to cost in excess of \$1,500,000.

The Monticello Tire & Rubber Co., Monticello, Iowa, has filed plans for the erection of a new one-story plant, 60 x 160 ft., to be equipped for the manufacture of automobile tires and other rubber products.

A vocational department will be installed in the new two-story and basement high school to be erected by the Board of Education, Consolidated District, Reinbeck, Iowa, estimated to cost about \$250,000. Bids will be taken at once. Nefcott, Donnon & Nefcott, Black Building, Waterloo, Iowa, are architects.

Philadelphia

PHILADELPHIA, Jan. 2.

Horace T. Potts & Co., 316-20 North Third Street, Philadelphia, manufacturers of iron and steel products, will defer until early spring the construction of their new foundry and iron-working buildings at Erie Avenue and D Street, contract for which was awarded to the William Steele & Sons Co., 1600 Arch Street. The plant will cost in excess of \$100,000.

The F. Weber Co., 1220 Buttonwood Avenue, Philadelphia, manufacturer of drawing instruments and precision products, has awarded contract to the A. Raymond Raff Co., 1635 Thompson Street, for rebuilding the portion of its plant recently destroyed by fire. The construction will cost about \$30,000.

The Energy Elevator Co., 214 New Street, Philadelphia, manufacturer of freight elevators, etc., has taken title to property adjoining its plant for extensions.

A two-story power plant, 53 x 60 ft., will be erected by the board of directors, St. James Mercy Hospital, Chester, Pa., in connection with a new four-story hospital. Bids will be asked early in January. F. F. Durang, 1220 Locust Street, Philadelphia, is architect.

The Allen Iron & Steel Co., Third and Venango streets, Philadelphia, has filed plans for a new one-story building, for general works service, estimated to cost about \$18,000. The Austin Co., Bulletin Building, is contractor.

A vocational department will be installed in the three-story and basement senior and junior high school to be erected by the Radnor Township School District, 115 North Wayne Avenue, Wayne, Pa., estimated to cost about \$150,000. H. C. Richards, 608 Chestnut Street, Philadelphia, is architect.

The Shippers' Car Line, Milton, Pa., a subsidiary of the American Car & Foundry Co., operating a local tank car repair plant, is planning to rebuild the portion of the works destroyed by fire, Dec. 22, with loss of about \$25,000. The fire was confined for the most part to the shearing department and washer shop.

The Frick Co., Wavnesboro, Pa., manufacturer of agricultural implements and parts, will soon take bids for a one-story addition, 50 x 100 ft., to be used as an erecting shop and for engine production. A. O. Frick is vice-president and general manager.

The E. Keeler Co., Williamsport, Pa., manufacturer of stationary steam boilers, etc., is considering the erection of a one and two-story addition.

The Swedesboro Ice & Cold Storage Co., Swedesboro, Philadelphia, has awarded contract for its new ice-manufacturing and cold storage plant to William F. Koelle & Co., Twenty-sixth and Oxford streets, Philadelphia, and work will commence at once. It is estimated to cost about \$100,000.

The Hanover Automobile Co., Hanover, Pa., occupying the former plant of the General Gas & Electric Co., is planning for enlargements to provide for a capacity of 1000 cars a month, designed to sell for about \$300 each. It is expected to give employment to about 1500 operatives.

Baltimore

BALTIMORE, Jan. 2.

The Parker Metal Decorating Co., Howard and Ostend streets, Baltimore, has filed plans for a one-story factory, 60 x 69 ft., to replace a portion of its works recently destroyed by fire.

The Board of Works, Baltimore, is considering tentative plans for a central machine and repair shop for municipal departments. Edward G. Rost, City Hall, is mechanical superintendent.

Officials of the S. B. Sexton Stove & Mfg. Co., 501 West Conway Street, Baltimore, have organized the Isaac A. Sheppard Co., to succeed the former company of that name and whose plant, known as the Excelsior Stove Works at Chester and Eastern avenues, was purchased recently by the Sexton company under a bankruptcy sale. The new company will be capitalized at \$2,100,000 and will operate at the plant for the manufacture of stoves, stove castings, heating and cooking equipment, ventilating apparatus, etc. The incorporators are Charles S. Austin, Jesse N. Bowen and Arthur W. Baker. The registered agent is Clarence K. Sexton, address noted.

The Bostwick-Lyon Bronze Co., Waynesport, Pa., operating the Hagerstown Bearing Metal Works, Hagerstown, Md., as a branch plant, has purchased the plant and business of the Maryland Smelting & Refining Co., Hagerstown. The company will be merged with the Hagerstown Bearing Metal Works and the plant used for expansion.

The State Board of Prison Control, Baltimore, has plans under way for a two-story mechanical and industrial shop at the Maryland House of Correction, Bridewell, Md., 45 x 150 ft., estimated to cost about \$40,000. Theodore W. Pietsch, American Building, Baltimore, is architect.

The Palmetto Concrete Mfg. & Machinery Co., 1422 Henderson Street, Columbia, S. C., has completed plans for two new buildings, 40 x 100 ft. and 30 x 90 ft., and will commence work soon. H. C. Randolph is president.

The Jarvis Storage Battery Co., 229 South Liberty Street, Winston-Salem, N. C., recently organized with a capital of \$50,000, has plans under way for a new one-story factory to manufacture storage batteries. A site has been purchased. G. C. Jarvis is president, and O. F. Brown, vice-president.

The Georgia Railway & Power Co., Atlanta, Ga., is arranging for a bond issue of \$13,000,000, about \$3,000,000 of which will be used for electric plant extensions and improvements. A program has been arranged to include the completion of a hydroelectric generating plant on the Tugalo River, with capacity of about 80,000-hp.; enlarging the generating plant at Morgan Falls, new electrical equipment, etc. Harry M. Atkinson is chairman of the board.

The Norfolk & Western Railway Co., Roanoke, Va., will build a new coaling plant at Williamson, W. Va., to cost about \$75,000, including mechanical equipment.

The Richmond Car Works, Richmond, Va., recently organized, has taken title to the Government plant at South Richmond for \$230,000, originally designed as a marine boiler plant for the United States Shipping Board. The site totals 52 acres, with main building, 180 x 600 ft. It will be equipped at once for the manufacture of steam and electric cars and other products. Lewis C. Williams is president.

Pittsburgh

SEATTLE, Dec. 20.

The closing week of the old year was featured by at least one good-sized order, namely, the mill-drives for a blooming mill and a continuous mill at the Steubenville, Ohio, plant (LaBelle Works), of the Wheeling Steel Corporation. This order, placed through the Dravo-Doyle Co., Pittsburgh, is for two Nordberg four-cylinder uniflow engines. Generally, business in machinery and equipment has been quiet, but this is merely looked upon as a seasonal condition and the common expectation is that some action will be taken on pending business as soon as the inventory period is out of the way. There have been no crane awards the past week, but a number of inquiries are regarded as near the closing stage and buyers are believed to be holding back orders chiefly to put the purchases on 1922 accounts. It is said that the Niles-Rement-Fond Co. submitted the lowest bid against the inquiry of the Elliott Co., Jeannette, Pa., for a 50-ton overhead with 10-ton auxiliary and span of 58 ft. 6 in. The Universal Steel Co., Bridgeville, Pa., has placed an order with Manning, Maxwell & Moore, Inc., for two Chambersburg hammers, one a 1500-lb. steam drop hammer and the other a 1200-lb. board drop, hammer. The Allis-Chalmers Mfg. Co., has taken an order for a Barr chain grizzly for the Jones & Laughlin Steel Co., for its ore mining subsidiary, the Interstate Iron Co.

Cincinnati

CINCINNATI, Jan. 2.

There have been few developments in the machinery market the past week. The Chicago, Burlington & Quincy Railroad issued a list which is now being figured on. With this exception new inquiries are at a low rate. Few orders have been booked, the largest consisting of a number of wood-working machines bought by a Middle Western railroad. No action has been taken on the C. & O. list or the one issued by the Rock Island. The Louisville & Nashville Railroad is expected to close this week on a number of tools recently inquired for.

With the passing of 1921, one of the poorest years in the machine tool industry for the past decade has been closed. Many of the smaller manufacturers of tools have been shut down since last spring and only skeleton forces are employed in many of the larger ones. Some plants have been able to maintain a fair rate of operation, but on an average the machine tool industry during the year did not exceed 25 per cent of capacity. However, while the year was poor, orders booked during December, and the number of live inquiries still outstanding, have somewhat encouraged manufacturers who now feel confident that the turning point has been passed and a steady improvement will be forthcoming.

The Central South

ST. LOUIS, Jan. 2.

The Superior Ice & Storage Co., Lee Building, Kansas City, Mo., will break ground at once for a new ice-manufacturing plant, with a daily capacity of about 100 tons. It is estimated to cost approximately \$100,000. A. L. Williams is head.

The Mobile & Ohio Railroad Co., St. Louis, will install a new coal and cinder handling plant at its yards at Jackson, Tenn., estimated to cost about \$25,000.

The Board of Directors, University of Missouri, Columbia, Mo., is completing plans and will soon call for bids for a one-story and basement power plant, estimated to cost about \$150,000. James P. Jamieson, Security Building, St. Louis, is head of the board.

At a special election, Dec. 21, at Lawton, Okla., bonds were approved for \$600,000 for the construction of a municipal electric power plant and distributing system.

The Harlan Ice & Refrigerator Co., Harlan, Ky., is planning the erection of a new one-story factory. It recently increased its capital to \$100,000 for expansion.

A vocational department will be installed in the new high school to be constructed at Flat River, Mo., estimated to cost about \$100,000. J. H. Felt & Co., Temple Building, Kansas City, Mo., are architects.

The International Harvester Co., 606 South Michigan Avenue, Chicago, will rebuild the portion of its repair shops at Salina, Kan., and will break ground at once. The new structure will cost close to \$20,000, exclusive of equipment.

Seattle

PITTSBURGH, Jan. 2.

The Chehalis Box, Basket & Veneer Co., Chehalis, Wash., has completed plans for the rebuilding of its factory at North Chehalis, and proposes to commence work soon. It will be equipped for a capacity of 20,000 boxes per day, and is estimated to cost close to \$90,000, including machinery. L. J. Sticklin is president.

A. M. Elliott, Vancouver, Wash., formerly connected with the B. F. Goodrich Co., Akron, Ohio, is organizing a company to establish a plant to manufacture automobile tires and tubes. The local Commercial Club is interested in the project, and a site is being selected.

The Elmore Copper Co., Mountain Home, Idaho, has been granted permission to construct a dam and hydroelectric power plant on the South Fork of the Boise River, about 25 miles north of the Arrowhead dam. It is said that the project will cost in excess of \$100,000.

The Common Council, Yamhill, Ore., is considering the construction of a municipal electric lighting plant.

The Airo Metal Products Co., Yakima, Wash., has acquired the plant and business of the Crimp-Hards Mfg. Co., Ellensburg, Wash., manufacturer of automatic pumps and parts. The business will be continued at the present location until spring, when it will be removed to the Yakima works. The latter plant will be enlarged.

The Board of Directors, University of Montana, Bozeman, will take bids until Jan. 14 for the construction of

new engineering building and shops. On Jan. 21, bids will be opened for power house equipment at the college. An appropriation of \$1,400,000 is available for these and other extensions.

The Gulf States

BIRMINGHAM, Jan. 2.

The Humphreys-Pure Oil Refineries Corporation, Mexia, Tex., has been incorporated under Delaware laws with capital of \$50,000,000 to build a local refinery. It is an affiliation of the Humphreys-Mexia Co. and the Pure Oil Co. Plans are under way for the erection of a refinery in the vicinity of Dallas, Tex., and pipe line to the Gulf, estimated to cost close to \$5,000,000, complete. Col. E. A. Humphreys is one of the heads of the company.

The Wilson Hydraulic Casing Machine Co., Clarksburg, W. Va., Daniel Howard, head, is planning the construction of a one-story machine works at Burkburnett, Tex., to manufacture machine equipment for oil well service.

The Leesburg Pulp Mill, Leesburg, Fla., is planning for enlargements to double the present capacity. Considerable new machinery will be installed.

The Wichita Motors Co., Wichita, Tex., is arranging for the manufacture of cotton-picking machinery at its plant, to be marketed as the Price-Campbell cotton picker. Parts production and assembling will be carried out at the works. J. G. Culbertson is president.

Henry and James Coyle, Huntsville, Ala., are organizing a company to establish a plant to manufacture spark plugs of special type and other ignition equipment.

The Maddox Foundry & Machine Co., Archer, Fla., is considering the erection of a new one-story foundry, 40 x 50 ft. H. Maddox is general manager.

The Common Council, St. Augustine, Fla., is planning for a bond issue of \$30,000 for the establishment of a municipal electric light and power plant. Plans will be prepared at an early date.

California

SAN FRANCISCO, Dec. 20.

The Tunison Motor Co., Hayward, Cal., is perfecting plans for the erection of a new plant at Oakland, Cal., to manufacture automobiles. It is proposed to produce all equipment and parts, with the exception of bearings, electrical accessories and minor equipment. A. W. Beam, head of the local Chamber of Commerce, was recently elected president of the company. George H. Reuben is general manager.

The Terminal Iron Works, Stockton, Cal., recently organized, has acquired the plant and business of the Stockton Iron Works, and will operate the property. An adjoining site has been leased for an addition. Harry W. Fawke, formerly superintendent of the Moore Shipbuilding Co., is head.

A vocational department will be installed in the high school to be erected by the Board of Education, Orange, Cal., estimated to cost about \$130,000. Allison & Allison, Hibernian Building, Los Angeles, are architects.

The Great Western Power Co., 14 Sanson Street, San Francisco, has tentative plans for a new hydroelectric generating plant in the vicinity of Oroville, Cal., estimated to cost about \$2,000,000.

The Automatic Electric Machine Co., San Francisco, manufacturer of automatic dating and canceling machines and parts, is planning the erection of a new factory at Oakland, Cal., where a site has been selected. It is proposed to commence work at an early date. H. G. Lundgren is president.

The Board of Education, Lodi, Cal., has instructed William Inch, principal of the Union High School, to have plans prepared for a new mechanical and manual training shop at the present school, in connection with a proposed science building.

Mallory Brothers, Santa Rosa, Cal., operating a general machine works, are planning the erection of a new reinforced-concrete machine and forge shop. The present works will be removed to the structure upon completion and additional equipment installed.

The Sugar Pine Lumber Co., First National Bank Building, San Francisco, has plans under way for a new lumber mill on the San Joaquin River, near Fresno, estimated to cost about \$2,000,000, including power plant, machinery, etc. The company will also build a railroad, estimated to cost approximately a like amount, including locomotives and other rolling stock. Elmer H. Cox is president.

The Board of Supervisors of Santa Clara County, San Jose, Cal., will build a new power house and cold storage plant at the County Hospital.

Cleveland

CLEVELAND, Jan. 2.

While orders are light machine tool manufacturers report considerable improvement in inquiry which is in marked contrast with the holiday period a year ago when everything in machinery lines was flat. Makers of automatic machinery have recently received a number of inquiries ranging from single tools up to lots of 10 machines, mostly from the automobile and allied industries. Makers of screw machinery and turret lathes are getting some orders from the brass and other industries and report an improvement in inquiries. A local manufacturer has taken an order from the Hudson Motor Car Co. for two automatic screw machines and another order for two machines from the Seaboard Airline Railroad.

Local dealers state that the holiday week has had little effect on the market as the volume of business has kept up at about the recent rate. There is a moderate inquiry for from one to four machines. The demand is largely for small machines and the prospective buyers usually favor used tools. Considerable of the inquiry is coming from small machine shops doing repair work.

The General Motors Corporation is still shipping its surplus machinery to Detroit and it is expected that this will be placed on the market early in January. The number of machines, originally estimated at 1600, has been increased to 2500 to 3000. However, as the machines are shipped in, superintendents of the various General Motors plants are picking out tools that have come from other plants that they can use so that the total number to be placed on the market may not be much over 2000. These will be sold through dealers.

The Sandusky Cement Co., Engineers Building, Cleveland, will shortly place contracts for the erection of a new cement plant near Toledo, Ohio. It will probably include three buildings of steel construction. Complete equipment will be purchased. Three overhead traveling cranes with 80-ft. span and approximately 10-ton capacity to handle three yard buckets will be required. An inquiry for the cranes has already been sent out.

Milwaukee

MILWAUKEE, Jan. 3.

Although sales in the last week to 10 days were small, inquiry was unusually active, considering the period, and it appears very likely that orders on these will mature shortly. Makers of milling machines expect renewed interest from the automotive and agricultural implement industries. The former have been buying on a small scale, while the latter were out of the market the greater part of the past year. A hopeful sign for all classes of tool business is that new enterprises are again being established, due to the easier financial situation. At present their requirements are only relieving the used tool situation and then only to a limited extent.

The Sunby Battery Co., Milwaukee, has been organized with an authorized capital stock of \$500,000 to manufacture storage batteries and similar specialties. The principals are represented by Emil J. Gehrz and Walter Schinz, Jr., attorneys, 105 Wells Street, who for the present will not reveal the identity of the promoters or issue details concerning the enterprise.

The Starcast Aluminum Co., Milwaukee, has been incorporated with a capital stock of \$10,000 to manufacture aluminum parts and specialties. The incorporators are Nicholas A. Boehm, president and treasurer Wisconsin Brass Foundry Co., 1664-1674 Fratney Street, Helen C. Boehm, and Herman Beckman, superintendent of the brass company.

The Board of Education, Clear Lake, Wis., has engaged Edwins & Edwins, 911 Northwestern Building, Minneapolis, Minn., to design a new high school with manual training facilities, to cost not more than \$125,000. Bids will be taken about Jan. 15. J. Enderholm is clerk of the board.

The Combination Door & Screen Co., 180 Ruggles Street, Fond du Lac, Wis., has let the general contract to the Hutter Construction Co., local, for a two-story brick and concrete addition, 50 x 75 ft., estimated to cost \$30,000 with new equipment.

The Automatic Railway Gate Co., Milwaukee, has been incorporated with a capital stock of \$5,000 to manufacture safety devices for railroad crossings. The incorporators are Frank P. Mansfield, 426 Thirty-first Street, and Ottmar Kloetzner, Jr., and Gilbert Lappley, attorneys, 1414 Grand Avenue, Milwaukee. No plans have as yet been made for the establishment of a factory.

The Iola, Wis., Board of Education has plans by Edward Tough, architect, Madison, Wis., for a three-story addition, 52 x 78 ft., to the high school, part of which will be equipped for vocational training. F. C. Wipf is secretary.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The quotations given below are for small lots, as sold from stores in New York City by merchants carrying stocks.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price.....	2.68c.
Swedish bars, base price.....	10.00c.
Soft steel bars, base price.....	2.68c.
Hoops, base price.....	3.53c.
Bands, base price.....	3.28c.
Beams and channels, angles and tees	
3 in. x ¼ in. and larger, base.....	2.78c.
Channels, angles and tees under 3 in. x ¼ in., base.....	2.68c.

Merchant Steel

	Per Lb.
Tire, 1½ x ¼ in. and larger.....	2.65c.
(Smooth finish, 1 to 2½ x ¼ in. and larger) ..	2.85c.
Toe calk, ½ x ¾ in. and larger.....	3.25c.
Cold-rolled strip, soft and quarter hard.....	6.25c. to 7.25c.
Open-hearth spring steel.....	3.75c. to 6c.
Shafting and Screw Stock:	
Rounds.....	3.55c.
Squares, flats and hex.....	4.05c.
Standard cast steel, base price.....	12.00c.
Extra cast steel.....	17.00c.
Special cast steel.....	22.00c.

Tank Plates—Steel

¼ in. and heavier.....	2.78c.

THE IRON AGE

New York, January 12, 1922

ESTABLISHED 1855

VOL. 109, No. 2

Semi-Continuous Bar Mill for Alloy Steel

Cooling Equipment Embodies Inclined Escapement and Horizontal Notched Bed Features—Flat Spring Steel Is Self-annealed in Packs

BY F. L. PRENTISS

THE United Alloy Steel Corporation, Canton, Ohio, has recently placed in operation a new 12-in. semi-continuous bar mill, designed and built by the Morgan Construction Co., Worcester, Mass. It is of a special type and includes interesting and novel features to insure the economical production of large outputs of high quality alloy steel products.

The most interesting feature of the installation is the equipment for handling the steel from the time it leaves the finishing rolls until it is cooled and sheared. In modern merchant bar mills, the automatic cooling

eliminate. The problem was put up to the Morgan Construction Co., which incorporated in the cooling bed means for self annealing under temperature control, with neither fuel nor labor costs.

This cooling bed is a combination of two distinct types of bed. The first portion is the well known Edwards inclined escapement bed, which in this case has racks very much shorter than usual. The function of this portion of the bed is to control the bars while they drop from rolling heat to annealing heat. The second portion is a horizontal notched bed capable of

The Cooling Bed Is a Combination of the Inclined Escapement Type and the Horizontal Notched Type. Between the two sections is a packing device, flat alloy spring steel being carried in packs across the horizontal section. The product is self-annealed in these slowly cooling packs. The cooling bed is double (the photograph showing only one side) to take care of the large output in case the mill is operating for some time on alloy steel spring flats, and requiring continuous use of the packing device. The magnetic controllers for the auxiliary motors are on balconies along the side wall, a safety first feature.

bed takes up a very large portion of the mill building and, in a way, dwarfs the rolling mill unit proper. In this particular case, the cooling bed is more than ever the predominant feature of the mill, not only because it is a double bed, 240 ft. long, but also because there has been incorporated in this bed means for controlling the physical structure of the rolled product.

The annealing of alloy steel spring flats after rolling is a costly but necessary operation, which the United Alloy Steel Corporation has long sought to

receiving several bars in a single notch. Connecting these two portions of the bed is a mechanism designed to place flat alloy spring steel in an orderly pack in the first notch. Such a pack, having been formed at a high temperature, retains its heat very much longer than a single bar and the necessary self-annealing is thus performed in these slowly cooling packs. The mechanism can handle flats up to 6½ in. wide in packs up to 3 in. to 4 in. high. Each pack is carried as a unit from notch to notch, until it is delivered upon

Both the Roughing and Finishing Mills Are Driven by One Motor. This is a 3000-hp. adjustable speed induction motor which is provided with a Kramer regulating set for controlling the speed.

electrically-driven shuffle bars which separate the pack and carry the bars to the shear table. The cooling bed is operated by electric motors throughout, these being controlled from a pulpit by an operator having a clear view of the entire bed.

To provide for the large output of this mill, the cooling bed is made double, and the product is delivered to two No. 5 "Q" Morgan bar shears and back shear tables. These shears, with their back shear tables, deliver the cut product into cradles, mounted directly upon 100,000 lb. Fairbanks, Morse & Co. scales. Each shear is equipped with two hand-traversed shear gates. The shears and back shear tables are located in the shipping department of the mill, which is a building of 90-ft. span and 360 ft. in length, at right angles to the main building. This is served by two 10-ton Alliance cranes. Extension of this building is possible should the necessity for more shipping space arise. Three standard gage loading tracks serve the shipping building, and in addition, a narrow gage track connects this building with a heat-treating department.

Steel for the 12-in. mill is made on a 35-in. blooming mill, and after the billets have been inspected carefully and chipped for the removal of surface imperfections, they are transferred to the billet storage building, 80 x 300 ft., which adjoins the mill building. This is covered by a 10-ton Alliance crane which delivers the billets to the furnace charging platforms.

The billets are charged into two Morgan gravity discharge continuous-heating furnaces of the regenerative type with hearths, 34 x 13 ft. They are fired by gas from a battery of eight Morgan producers. This battery of producers also serves the soaking pits of the blooming mill which occupy an adjacent building.

The water-cooled furnace skid pipes extend to within 7 ft. of the discharge end of the furnace where they turn downwards. The remainder of the hearth bottom is of magnesite. On this hearth the cold spots in the billets caused by the water cooled skids disappear.

A new feature of the heating furnaces is the Isley gas regulating valve. This is the first installation of this form of gas regulator. The producers are located

The Finishing Mill Consists of Four 12-in. Stands, of the Staggered Duo Type, Arranged in Two Trains. The mill is equipped with four "Y" reversing skew roller tables which connect the successive passes. These tables are sufficiently long to handle, with any ordinary series of reduction, bars having a finished length of 240 ft.

Sixteen-Inch Vertical Edging Mills Are Used When Rolling Flat Bars, Thereby Greatly Reducing the Number of Slab Sections Required to Cover the Range of Production. Two are shown, one in front of the fifth stand, another following the sixth stand

fully 100 ft. from the furnace. The gas enters the mill building underground, and passes up through the regulating valves, where its admission to the furnace is manually-controlled by the heater from the furnace platform.

Each furnace is equipped with a single Isley reversing valve, which controls the regeneration of the air. Since the products of combustion flow through the heating furnace in one direction only, the valve is necessarily placed between the furnace and the checker chambers, and must handle on one side the products of combustion at their maximum heat, and on the other, the incoming air at its maximum heat. The valve is similar to the Isley valve commonly used under the less severe conditions of open-hearth practice.

Billets discharged from the heating furnace are carried on a standard billet conveyor to the roughing mill. In the table, in front of the first roughing stand, is an electrically-driven shear for dividing billets in order to produce in the finished section the desired length for the cooling bed.

The roughing mill is a special Morgan semi-continuous mill, consisting of six roughing and four finishing stands. The first two roughing stands have 18-in.

rolls, the last four, 16-in. rolls. The roughing mill is broken up into groups with connecting tables, the arrangement being such that the bar runs free between the first and second, the second and third, and the fourth and fifth stands.

In front of the fifth, and following the sixth roughing stands, are 16-in. vertical edging mills, driven from the cross shafts of the roughing mill. The edging rolls are employed when rolling flats, and by their use the number of slab sections required to cover the range of production is greatly lessened.

The finishing mill consists of four 12-in. stands of the George staggered duo type, the arrangement being two trains of two stands each. The mill is equipped with four "Y" reversing skew roller tables which connect the successive passes. These tables are ample in length to produce, with any ordinary series of reductions, bars having a length of 240 ft. when finished.

The roughing mill is designed to roll its product from billets, 3 in. to 6 in. square, and from slabs, 3 in. to 6 in. wide, and up to 2½ in. thick. The mill uses both billets and slabs up to 11 ft. 6 in. in length.

The usual practice will be to use 4- and 5-in. billets, except when rolling the larger round bars, for which 6-in. billets will be required. The finishing mill can

The Heating Furnaces Are Equipped with Isley Regulating Valves, This Being the First Installation of This Form of Gas Regulator. The gas enters the mill building underground and passes through the regulating valve, its admission to the furnace being manually controlled by a heater from the furnace platform. Each furnace is also equipped with a single Isley reversing valve for controlling the regeneration of the air. The gas regulating valve is shown in the foreground and the reversing valve back of it in front of the discharge end of the furnace

produce rounds from $\frac{3}{4}$ to $2\frac{1}{2}$ in. in diameter, flats up to $6\frac{1}{2}$ in. wide, and equivalent sections. The expected output is upwards of 10,000 tons per month of alloy and carbon steel.

The mill building is 90 x 680 ft., with a 40 x 100 ft. lean-to for the electrical sub-station. The roof is of the ordinary truss type. Ample window space is provided, steel sash on roller bearings being used throughout. The shipping and billet storage buildings are similar in construction. A railroad track extends part way down one side of the mill building for bringing in rolls and carrying out refuse. The building is served by a 10-ton Alliance crane. The water supply comes from the plant's general water works system. Water from the furnaces and mill is discharged to the sewer through two scale pits.

Both the roughing and finishing mills are driven by the same motor through a line shaft and gears. A set of main gears reduces the speed of the main motor to the desired speed for the main shaft. The driving

unit is a 3900 hp., 3-phase, 60-cycle, 2200-volt, Westinghouse induction motor, having a synchronous speed of 507 r.p.m. The motor is provided with a Kraemer regulating set which gives speed control between 500 and 300 r.p.m.

Electric current is supplied from the main power station, and is stepped down from 11,000 volts to 2200 volts through three 2000 kw. transformers. There are also three 333 kw. transformers which step down the 11,000 volt current to 181 volts for a rotary converter which supplies 250 volt direct current to the auxiliary motors that operate the cranes, mill tables, cooling bed and other equipment. All the motors, converters and transformer equipment were furnished by the Westinghouse Electric & Mfg. Co. All motors have magnetic control, either of the Westinghouse or Cutler-Hammer type. A safety feature in the plant arrangement is the placing of the magnetic controllers for the auxiliary motors on balconies along the side wall, several feet above the floor.

DISMANTLING VESSELS

Naval Officials Investigating as to Best Method of Procedure

WASHINGTON, Jan. 10.—Data are being assembled by naval officials with the aid of private interests, looking to the development of practical plans for the dismantling of vessels which the Navy is offering for sale, and others that will be disposed of according to the terms of the Conference on the Limitation of Armament. The material will be of great value in the event a permanent ship salvaging industry is established. The scrapping of the naval vessels would be an important preliminary to the institution of such an industry.

With the co-operation of publishers of technical papers, acetylene torch interests, and shipbuilders, as well as through its own direct efforts, the Navy Department is obtaining information from England, France and Germany as to the precise methods used in those countries in dismantling war vessels. Accompanying these studies will be photographs and possibly diagrams and charts showing the actual work of beaching, dry docking and scrapping the vessels, and the locations of sites of the work with respect to steel plants consuming the scrap that is removed and cut to size.

After this material is assembled, it is likely that another conference, supplementing the one held recently at the Philadelphia Navy Yard, will be held in Washington and specific discussion made of the entire scrapping program. It is believed on that occasion financiers, acetylene torch people, shipbuilders, and others, will be presented with sufficiently concrete studies of the subject so that they can intelligently make offers to the Navy Department for the purchase of vessels, with more assurance than has been possible heretofore, as to the success of their undertaking, which, being new, is in a state of uncertainty. Investigations by private interests themselves also will aid them in preparing estimates, should they become interested in the matter, and correspondence with the Navy Department indicates that they have been giving the question considerable study and are becoming interested in it.

It is believed that as to the iron and steel manufacturers, the only concern they will have will be as consumers of the scrap to be salvaged, and it remains to be seen whether this will be made available to them at attractive prices, and whether or not the tonnage will be desired, in view of the present unsatisfactory condition of the iron and steel markets.

While it has been stated that England has developed the ship salvaging industry to a greater and more scientific point than any other country, this opinion is not accepted by some who have casually studied the question. On the contrary, they think that Germany leads in this respect and that that country, through its experience in dismantling ships since the armistice has established the industry on a more economic and satis-

factory basis than any other. For this reason as much information as possible is to be obtained from the operations of the industry in Germany.

Another fact which indicates that the work of dismantling ships in Germany has developed to a successful point, at least for that country with its low costs of labor, is that several German firms are showing a keen interest in the proposed dismantling of American ships and have written to the Navy Department attempting to get the contracts for the dismantling of American vessels, which would have to be taken to Germany. These offers, however, are not being given the slightest consideration. At the outset, the Naval officials point out that the proposed plan of limiting the building of war vessels has been a severe blow to the shipyards of the United States, and it is not proposed to add to the difficulties of shipbuilders and workers by letting the work go outside of the United States. Secondly, Naval officials consider it absurd to think that a great industrial country like the United States cannot, if it chooses, develop a ship salvaging industry as efficient in every respect as any other country.

The assembling of information from foreign countries regarding salvaging may delay negotiations for the sale of the various naval vessels on which bids have been asked and which are to be opened on Jan. 16.

Time of No Accidents

"I believe the day is coming when we will have no accidents in industry. You and I may live to see that day," says Charles Close, manager of the Bureau of Safety, Sanitation, and Welfare of the United States Steel Corporation, in *National Safety News*.

"Two years ago I would not have said that," he continued, "but when I think of our Farrell Works, with a normal force of 3000 men, with all the hazards of the steel industry, going two months without a lost time accident, and our Edgar Thompson plant with a normal force of 6000 men going 54 days without an accident, and other remarkable records made by many of our plants, I do not hesitate to say I believe the day is coming when we will have no accidents in industry. And it is not very long ago that old timers were saying no steel mill could ever go a week without an accident."

"But to bring about the time of no accidents we have to develop a new generation of workmen. We must train the child so that he will develop habits of safety. We must do more than show him the safe way of doing things once, twice, or ten times. We must teach him the safe way of doing things every day, so that when he comes into the shop as a workman he will habitually do the safe thing just as his father today habitually does the unsafe thing."

The main building of the Pittsburgh Steel Tube Co., Beaver, Pa., was destroyed by fire on the morning of Jan. 1. The building was one story, of brick construction and housed the drawing mill and machine shop.

Light Movement of Lake Superior Ore

Steel Corporation and Others Give Employment to Miners
to Prevent Suffering—Moving of Hibbing Involves
Great Expense—Interesting Developments

BY DWIGHT E. WOODBRIDGE, E. M.*

THE Lake Superior iron ore trade of the past year has been at low ebb. Not since 1904, when shipments from Lake Superior were slightly under 22,000,000 tons, has there been a season of so small business. This year water shipments have been 22,852,871 tons, in addition to which there are some 425,000 tons all rail, making the gross tonnage from mines of the lake district 22,778,000 tons. Of this 15,555,000 tons were received at Lake Erie, and about 22,000 tons were sent to the St. Louis district for furnaces there. The figures include 52,145 tons shipped from the Canadian mines north of Michipicoten. Total movement of the year is almost precisely 33½ per cent of the business of 1916, the greatest year in the history of the American iron trade.

So much for statistics. They tell their own story.

This naturally has led to much unemployment in the iron region, and for a time the past fall, conditions were rather serious. Business conditions on all the ranges were very bad, collections slow, new buying slight, and a great number of men were without any work at all. To the everlasting credit of the Steel Corporation be it said that it undeviatingly maintained as nearly as possible a constant force and, while it was unable to furnish work to all its men continuously, it did arrange to keep most of them on a part time basis.

Grateful to the Corporation

While a full employment basis would have been about 12,000 men, it has gone into the winter with some 10,000 at work, half time or better. I well remember the time in Birmingham, a few years after the Steel Corporation became interested there, that the business interests of that city wanted to erect a statue in grateful commemoration of the purchase of the Tennessee Coal, Iron & Railroad Co. The business men of northern Minnesota have this winter had borne in upon them, as never before, the reason for that feeling in Birmingham seven or eight years ago. The Steel Corporation has realized the danger of unrest by unemployment, and its moral obligation to humanity and to the district. These same considerations have influenced the Lake Superior managers for several of the other concerns in the mining business and they have strained every nerve to induce their Eastern boards to follow a similar humanitarian policy, and finally with no small degree of success. As a rule these boards have been in no easy position in this matter, for they have appreciated that ore won now can be delivered only at a heavy loss and that the money for operations largely must be borrowed capital; and perhaps they were not fully awake to the needs of the situation until recently. The Hanna and Pickands, Mather and other smaller employers have ordered several mines into commission and the year closes with a far brighter labor outlook than was believed possible a few weeks ago. It is expected that additional mines will resume in January and that alleviation will continue throughout the rest of the winter. The general situation is more drastic than otherwise on account of the condition of the forest products market. Usually this absorbs thousands of men and is exceedingly active during winters; a year ago there were delivered in Duluth alone over one railway, the Duluth & Iron Range, 200 carloads of pulpwood daily for the entire winter; now this business is trifling, as is that of railway posts, poles, ties, etc.

Hanna Mines Resume

During December the Hanna interests resumed full time operations at four Mesabi mines, adding about 500

*Duluth, Minn.

men to the 250 they had been working there. The rate of pay was reduced to a basis of \$2.75 a day, common labor, so that miners are earning about \$3.75. Pickands, Mather & Co. resumed at three mines on the Menominee, and will start others on the Mesabi in January. Yale, Gogebic range, is to open in January with 300 men, full time; the Oliver mines at Ironwood are running full time; the Hanna interests have taken over the former Hayes properties, Ashland and others, and have been paying the 1921 scale, but no doubt will reduce this soon. Ironton is to be on good production soon. Several mines at Crystal Falls are reopened, paying the 1913 scale which, at that point of low living costs, was about \$2.25.

Almost nothing is going on in mining on the Marquette range. The Gwinn district is idle; stock piles are so large in the entire Marquette region that there is little hope of much activity for some time. At Iron River, Crystal Falls, Norway and Vulcan, on the Menominee, things are fair for the times; the Cuyuna is almost in a state of coma; the Vermillion is more busy, relatively, than any of the lake districts, with most of its mines running and a new one under development.

The Most Hopeful Spot

Really, the most hopeful spot in the region is Iron Mountain, where, to a very limited mine employment, is added the Ford body plant and sawmills, and where there are under negotiation two blast furnace projects. The expectation is that the Ford Motor Co. will construct plants at Iron Mountain for the manufacture of all its motor bodies, and a building 900 ft. long is now under way. By rail shipment to Menominee and from there by water to Detroit, these knocked-down bodies can be delivered cheaply. The Ford purchase of the properties of the Michigan Land & Iron Co. gave it an abundance of hard woods for its requirements.

The lower the price of ore and in general the greater the need for economy in operation, the higher is the Minnesota proportion of the total output of the Lake Superior region; last year Minnesota's percentage of the total was 63, this year it is 79.5. Those figures are eloquent as to the activities of the Michigan districts during the year.

European Ores

Just now the situation is complicated by the advent of northern European ores; while it is probable that the present price for Kiiruna ores delivered at Philadelphia, of say 8.5c. per unit of iron, is less than they will bring later, the fact that contracts are being arranged for perhaps 100,000 tons a year at a vessel rate of twenty shillings the ton, Narvik to Philadelphia, is interesting, to say the least. The price of lake ores is much mixed; at a time when prices are still quoted nominally at \$5.55, Mesabi non-bessemer, it is claimed by some buyers that quotations equivalent to \$4.20 are being made. It is further stated, by operators near St. Louis, that they are able to buy lake ores at \$4 delivered. This would not leave much above freights.

The Proposed Merger

Talk of a merger of various independent steel makers, all with more or less ore in the Lake Superior region, has served to call attention to these holdings and to the life of these deposits under normal mining activities as compared with those of the Steel Corporation; also to the vast reserves of the Mesabi Iron Co., soon now to come on the market as finished product of high grade ores. Of the approximately 250,000,000 tons of merchantable iron ore held by the seven steel companies mentioned as entering this merger, Midvale

has most, and Brier Hill least, but curiously enough, the life of these two, based on their annual consuming capacity, is almost the same. It is generally supposed that the ore interests of Pickands, Mather & Co. will be a part of the proposed organization and it is likely that the ore activities of the merger will be directed to a considerable extent by that company's organization; the situation, in this respect is somewhat analogous to that of the old Oliver Iron Mining Co. at the time of the organization of the Steel Corporation. The ore organization of the Republic is likely to be a factor also. The mines and ships of Pickands, Mather & Co. will be a valuable adjunct to the properties of the merger. These ships have a seasonal capacity for about 6,000,000 tons of ore, or say 45 per cent of the probable annual requirements. Some of the best ores held by companies expected to enter the merger are on short time leases, and it will be impossible to come anywhere near exhaustion of these mines before the expiration of present leases. The only very important ore tonnage classed as independent to be had in the lake district is that of the Mesabi Iron Co. One effect of the consideration of these facts has been to induce a more active inquiry for mines, and a number of transfers seems to be pending. Furthermore, there has been recent inquiry for undeveloped favorably situated ore lands, and this inquiry and examination has included tracts not commercial but containing large deposits of lean magnetites, capable of concentration, in both Minnesota and western Ontario. While there are no such vast bodies of these ores as that held by the Mesabi Iron Co., there are, nevertheless, deposits of fair grades collectively running into hundreds of millions of tons. That these will come into the market in due course there is scarcely a doubt.

Minnesota Grants Rights

After many years of withdrawal from market, the State of Minnesota is again to grant rights on mining lands, and the first bids for leases will be opened Jan. 9, next. There are a few State owned tracts—less than a dozen, perhaps—that present more or less attractive possibilities for mining. The law differs from that which was repealed some years ago in several particulars: The maximum unit of land to be taken under one permit is now 80 acres; formerly 160. The royalty is on a sliding scale based on assay of ore and beginning at 25c. or less (dry analysis) on which grade the minimum royalty is 12c. a ton, with a 5 per cent cumulative increase in royalty for every 1 per cent increase in grade. Under this an ore assaying 50 per cent (dry) will be charged a minimum royalty of 40.3c., formerly 25c. for all grades. These are minimum royalties, but properties are put up for lease under sealed bids which must not be under the minimums, and are disposed of to the highest bidder. Formerly there were no bids, the first applicant having preference, but if there were synchronous applicants, then these were given opportunity to bid against each other. The sum to be advanced by applicants is now \$250, of which \$50 is with the application for a permit and \$200 is to bind the successful applicant to "carry out in good faith the covenants of the permit." Formerly the total cost of a permit was \$50. In case land desired contains ore of a class suitable for magnetic separation, only the contained magnetite is considered as iron in figuring the assay value.

No doubt there will be many bids for the few tracts worth consideration, most of which probably contain one form or another of concentrating ore.

Many old State leases, all of which were for the period of 50 years, are approaching maturity; and it will be the efforts of lessees to exhaust them in the next 20 years. This will result in the concentration of effort at points where State leases still show large tonnages, notably to the Mesabi Mountain mine of the Oliver company; and will tend to disarrange former schedules elsewhere.

The Removal of Hibbing

Of spectacular engineering or development projects there have been few during the year. Perhaps the most notable of these has been the removal of the village of

Hibbing. This, while begun some time ago, is now practically complete. It is the removal of the most densely populated 40 acres of the business and residence portion of a town of some 12,000 people to a site a couple of miles distant, in order to permit the mining of that 40 acres, which has long been under lease to the Oliver Iron mining Co. A reference to the map will show that this tract, the southwest quarter of the northwest quarter of section 6, township 57, 21, is surrounded on three sides by developed large open pit mines; to the east and north the Sellers, and to the west the Rust, all of the Oliver company. There also is a little ore on the Pillsbury forty to the south. Connecting these mines is a narrow railway cut from Sellers into Mahoning ground. Ore exists clear through from Sellers to Rust and underlies most of the 40 acre tract; and the overburden is light. It is generally supposed that from 35 to 40 million tons exist therein. The Oliver company has been at a very heavy expense to clear the ground for the proposed opening of this new mine; there have been purchased all the building lots on the 40 acres, and the plotting and building of a new town with all its street pavements, sewers, sidewalks, etc., all done on the most modern scale. Old buildings have been moved and repaired for occupancy, and new buildings have been put up under arrangements with the owners that permit them to buy on long term payments at very low interest. As all this building has been done during the high cost period and as much of this work has far overrun estimates, the amount of money invested by the company, either for itself or on contract, has been very large. The municipality itself has erected many extravagant buildings, such as a municipal power and steam distributing plant costing \$1,000,000, a high castle of a school costing more than \$3,000,000, and other structures in proportion. As about 95 per cent of the taxes levied in Hibbing have been against iron ore properties, these foolish extravagances, which the mining companies have been unable to curb until very recently, are being paid for almost entirely by them. The Oliver company does not do things by halves, and its own expense in the new town have been great. The finest hotel north of St. Paul, the best equipped hospital in the State, a considerable mileage of concreted streets and sidewalks, are all evidence of its liberal spirit. The new Hibbing is probably the most elaborate and metropolitan mining town in the world; all for the removal of open pit ore, the tonnage of which is numbered.

Ending Reckless Expenditures

There are evidences that the era of reckless spendings on the part of Mesabi range mining communities is about over. The thing has been going so fast from bad to worse that the companies have finally taken a decided stand against it, and have invoked, not only the power of the State legislature but of the courts as well. The State has passed laws limiting the expenditure of municipalities to a certain maximum per capita, and the courts have enjoined them from the construction of such public improvements as great recreation buildings, unnecessary schools, and the like. Of the total Mesabi range iron on tax rolls some 20 per cent is in Hibbing and some 4 per cent in Buhl. These two municipalities are referred to as they are among the chief offenders against decent economy in municipal operation. The first had an expenditure of \$225 and the other \$557 per inhabitant. The State has passed a law limiting municipal expenditures to \$100 for general purposes and \$60 for school purposes, per inhabitant. This will limit the Hibbing tax expenditure to about \$1,200,000 for running this village of 12,000 persons, and to \$720,000 for its schools, and one would think it should be able to worry along on this. Buhl, with its 1500 people, will have to economize down to about 28 per cent of its former orgies. The courts have stopped many of the contemplated municipal projects, some of which were well under way with a lot of contracts let and in progress, and the general attitude of governing bodies is one of returning sanity. Taxes have become such a burden that they were unbearable; those paid in the year 1921 over the Mesabi range as a whole have been not far from an average

of \$1 a ton on the ore produced this year, though the Mahoning mine stands out as a shining example with a tax against the year's production amounting to more than \$4 a ton. Even with a normal production of ore this mine would be paying about 60c. a ton this year.

State Profit Tax

Last winter the State legislature passed a law placing on iron mines a "profit tax" of 6 per cent based on a supposed net return to the property from its operations. No payments are due under this act until 1922, and what they will amount to is hard to say. It is scarcely conceivable that the mining companies will pay this discriminatory tax without legal opinion as to it, and the general opinion is that the law will be found unconstitutional.

The village of Mountain Iron, whose normal population is about 1200, had a tax collection this year of \$236,000; it is now limited by the courts to an expenditure of \$8,000 per month. This is now the general attitude of the courts, and it is quite evident that they will stand little more of the former reckless extravagance, which was not only a crime against the taxpayers but a crime against society as a whole.

An ambitious project of the early part of the year seems to have been postponed somewhat indefinitely; that is, the purchase of the Port Arthur blast furnace of the Atikokan Iron Co. and the development of the Gunflint district of the Mesabi. This was undertaken by a Chicago syndicate which spent considerable money only to find the plan impracticable for the present. No doubt there is a large amount of ore in the Gunflint, most of which is of the same type as that held by the Mesabi Iron Co., but the cost of concentrating works big enough to be commercial is very great. Other reasons also probably have led to a temporary abandonment of the project.

Proposed Blast Furnaces

Two undertakings for erection of charcoal blast furnaces at Iron Mountain, Menominee range, are in progress. The first of these, that of the West Chapin Mines Co., has begun construction and has financed itself to the extent of some \$600,000. This proposes to utilize the ores of the West Chapin, silicious hematites running about 40 per cent iron. Its plant is going in at the mines, to the west of the town. The other, under the direction of M. E. Richards, has not yet completed its financing, but is confident of doing so shortly; it expects to take advantage of various ores, more especially of a high lime deposit near Quinnesec. Both are to be of 100 tons capacity, and both will utilize, in part, waste wood products from the Ford mills and another large hardwood sawmill in Iron Mountain.

Imperial mine at Michigamme, belonging to the Ford Motor Co. interests, is in process of rehabilitation for production during 1922. There are a million or two tons of high moisture ore assaying about 46 per cent iron, and in the old days when operated by the Cleveland-Cliffs Iron Co., the property usually showed a loss. But there was a royalty which does not exist now.

Oglebay, Norton & Co. Operations.

Oglebay, Norton & Co., are sinking a 2000-ft. working shaft at their Montreal mine, western Gogebic, and it is now down to ledge. The Republic Iron & Steel Co. is extending its operations in the same region, taking additional properties and planning larger developments. Sunday Lake shaft is to be concreted and much additional work done there by Pickands, Mather & Co. During the year, the McKinney Steel Co. started its completed electrification at Ironton mine. The hoist is the largest d. c. motor-driven iron ore hoist in America, having a capacity for 210 tons per hr. from a depth of 3000 ft., at a speed of 2500 ft. per minute. The shaft at present is 1500 ft. deep, is vertical, of four compartments, with steel timbering to the bottom, and is concreted from surface to ledge, at 90 ft. Hoists, motors and auxiliary machinery are housed in a steel and brick structure that was erected last winter when the average temperature was 6 deg. above zero, and when there was an extreme low of 37 deg. below. The entire installation is very complete and presages

a far greater development at both Ironton and Colby mines than has ever yet been undertaken there.

Some development is under way on the Mesabi, the chief of which is the stripping of Prindle mine, section 2r, 57, 22, by the Oliver Iron Mining Co. A total of 2,000,000 yards will be moved, exposing some 3,000,000 tons of ore. This is at the village of Kewatin, close to the Sargent, St. Paul and Bennett mines.

At the east end of Vermillion Lake, Vermillion range, the Chippewa Mining Co. is developing its Armstrong Bay mine; the company anticipates shipping 100,000 tons in 1922. Its ore is a typical Vermillion.

Called to South Manchuria

During the summer, a group of Minnesota engineers and geologists were called to South Manchuria by the South Manchurian Railway, to examine low grade iron and large coal deposits. It seems that there are vast tonnages of ore, low in grade, but large part magnetic, situated along the line of the railway, and close to the same company's two blast furnaces at Aushan. The duty of these engineers was to see if these ores might be made treatable by magnetic separation, which they seem to be, although the proportion of hematite in the ore forbids a clean separation. Mining now is by hand on high-grade only, and the work is merely the following of seams that are good enough to use. It is generally understood that if the Japanese retain their Manchurian control, these properties will be developed under the management of Americans.

The Great Northern railway is to build a steel and concrete ore shipping pier to take the place of its No. 2, at Allouez Bay, Superior, at an estimated cost of \$3,000,000. Work began in December, and the pier will be ready for the business of 1923. It will be 2100 ft. long, besides approach, and will have 350 pockets, and a probable capacity for storage of 175,000 tons of ore. No. 2, now being razed, has capacity for 105,000 tons.

The Largest Producers

Shipments for the year by the five largest producers in the Lake Superior country have been as follows:

	Minnesota	Michigan	Total
Oliver Iron Mining Co.	11,700,000	2,144,000	13,844,000
Pickands, Mather & Co.	626,500	968,000	1,694,500
M. A. Hanna interests.	1,119,000	232,000	1,351,000
Cleveland-Cliffs Iron Co.	320,000	667,000	987,000

Decrease in Movement of Raw Products

WASHINGTON, Jan. 10.—The sharp decline in the transportation movement of raw products used by the steel industry and of its manufactured materials for the quarter ending Sept. 30, 1921, compared with the same period of last year, is shown by the regular quarterly statistical summary of the Interstate Commerce Commission made public last Friday, dealing with commodities moving over Class I roads, or those having annual operating revenues above \$1,000,000.

For the entire United States the tonnage of soft coal, coke, iron ore, pig iron and blooms, rails and fastenings, bars, sheets, structural iron and pipe, the shipments on originating roads for the quarter ending Sept. 30 of the current year aggregated 1,860,663 net tons, as compared with 3,302,625 tons for the same quarter of 1920, amounting to a decline of 43 per cent. The grand total of all traffic on originating lines was 7,056,597 carloads for the third quarter of this year and 9,571,611 carloads for the same quarter of 1920.

The figures by products consumed and manufactured by the iron and steel industry follow:

Carloads of Freight Hauled on Originating Railroads—United States

	Quarter Ending—	
	Sept. 30, 1921	Sept. 30, 1920
Bituminous coal	1,402,003	2,057,197
Coke	49,137	196,707
Iron ore	283,682	723,246
Pig iron and blooms	24,014	94,669
Rails and fastenings	18,040	20,775
Bars, sheets, structural and pipe	88,786	210,031
Total carloads	1,860,663	3,302,625

Auxiliary Grinding Wheel Truing Attachment

The Precision & Thread Grinder Mfg. Co., Philadelphia, has placed on the market an improved permanent alinement wheel truing head, shown in the accompanying illustration. It is for use on the company's multigraduated precision thread grinder, but can also be used as an auxiliary wheel truing head on any grinding machine.

The device is intended to keep the wheel always in correct alinement with the lead of the thread being ground. It dresses the V-form on the wheel to a sharper point, facilitating the grinding of much finer pitch threads than usually practicable. There is said to be no limit to the length of thread which may be accurately ground, as the grinding wheel may be trued while grinding. The in-feed for the head is graduated

Permanent Alinement Wheel Truing Head. The diamonds are traversed by operating the double-ended handle on the extended threaded shaft

in 0.001 in. which enables the attachment to be fed-in the same amount as the wheel diameter is reduced by wear and dressing.

The form dressed on the wheel is always in line with the axis of the work centers, as the diamond holder head is graduated in degrees corresponding to the spindle graduation on the grinder proper. The diamonds are traversed by operating the double-ended handle on the extended threaded shaft. They do not cut the wheel simultaneously but in progressive order.

A feature of the attachment lies in the self-sharpening position of the diamonds. They are positioned at an angle of 10 deg. and after slight wear can be rotated a fraction of a turn to present a new point to the wheel. This can be continued until the diamond is worn down to its setting. A stop provided for regulating the return traverse of the two diamonds can be utilized for pre-determining the amount of flat desired at the bottom of the thread angle, thus assuring the same amount of flat regardless of re-dressings and without subsequent re-gaging.

New Combination Drill and Valve Grinder

Following a series of tests by outside interests extending over a period of two years, the Rivett Lathe & Grinder Co., Brighton, Boston, is manufacturing and selling for the Worcester Electric Tool Corporation a combination drill and valve grinder, known as the Huskee combination. The tool has a drilling capacity guaranteed up to $\frac{1}{2}$ -in. in tool steel, although in careful

hands holes up to $\frac{1}{2}$ -in. can be drilled in tool steel and $\frac{3}{4}$ -in. in soft metal. Is specially designed for service station, garage and repair shop work.

It has a spade handle, which accommodates the largest hand and enables the operator to use the tool as a breast or shoulder drill; the side handle carries the switch, while a heavy head protects the switch buttons. This handle, flattened on two sides and internally reinforced, is designed to be held in a vise. The tool combines the oscillating motion of the valve grinder and the rotary motion of the drill. To change from a drill to a valve grinder it is only necessary to unscrew the drill chuck and slip on the valve grinding sleeve. The tool can be plugged in on any ordinary lamp socket. With the valve grinding attachment it weighs 10 $\frac{1}{2}$ lbs., and with the drill chuck, 11 lb.

New Portable Boring Unit

A new boring unit based largely on the principles of the portable boring bar and similar in several features to the unit described in THE IRON AGE of Nov. 24, 1921, has been placed on the market by the Pedrick Tool & Machine Co., Philadelphia.

The appliance is shown in the accompanying illustration set up for boring the bearings in a large housing, an extension bar being used. It will drill and feed an auxiliary bar 20 ft. long, and operate either horizontally or vertically. It is claimed that, erected on an angle plate in the shop or attached to bridge members 100 ft. in the air, it will start a hole through a blank surface and bore it out to a size up to the range of any machine with the same spindle diameter.

The four members composing it are the bar, the feed, the driving gearing and the crosshead mechanism. The bar is a steel forging having a square-threaded feed screw embedded in a groove almost the full length of the bar. A 3-in. diameter bar is 3 ft. long and affords 18 in. of travel. The lower end of the bar is bored taper to hold other tools. The feed case is at-

Portable Boring Unit Set Up for Boring in Line the Bearings in Large Housings. The device can be used either horizontally or vertically

tached to the other end of the bar and by blocking the handwheel, becomes automatic in action. Two changes of feed are regularly provided and are operated by movement of a slip pin. If required, however, the unit can be equipped with a three-change feed case. The driving gearing is in compound ratio. Power may be applied to the primary pinion by belt, air drill, electric motor, or by hand.

The crosshead supports and guides the bar, and space blocks provide room between the work and the end of the bar. The crosshead has been designed to facilitate accurate and convenient centering of the bar. When the crosshead has been set up roughly central with the work, four radially-disposed set screws, projecting internally against a bearing, permit shifting the bar to its final alinement. Four bolts on the top of the bearing plate are then tightened and the whole firmly secured.

The Joel M. Stearns Co., Greenfield, Mass., with a capital of \$75,000, has been given a charter to deal in iron, steel, builders' hardware, etc. Joel M. Stearns, Greenfield, is president.

INGOT REHEATING FURNACE

New Design to Avoid Imperfect and Unequal Heating by Proper Control of Incoming Gases

BY H. E. SMYTHE*

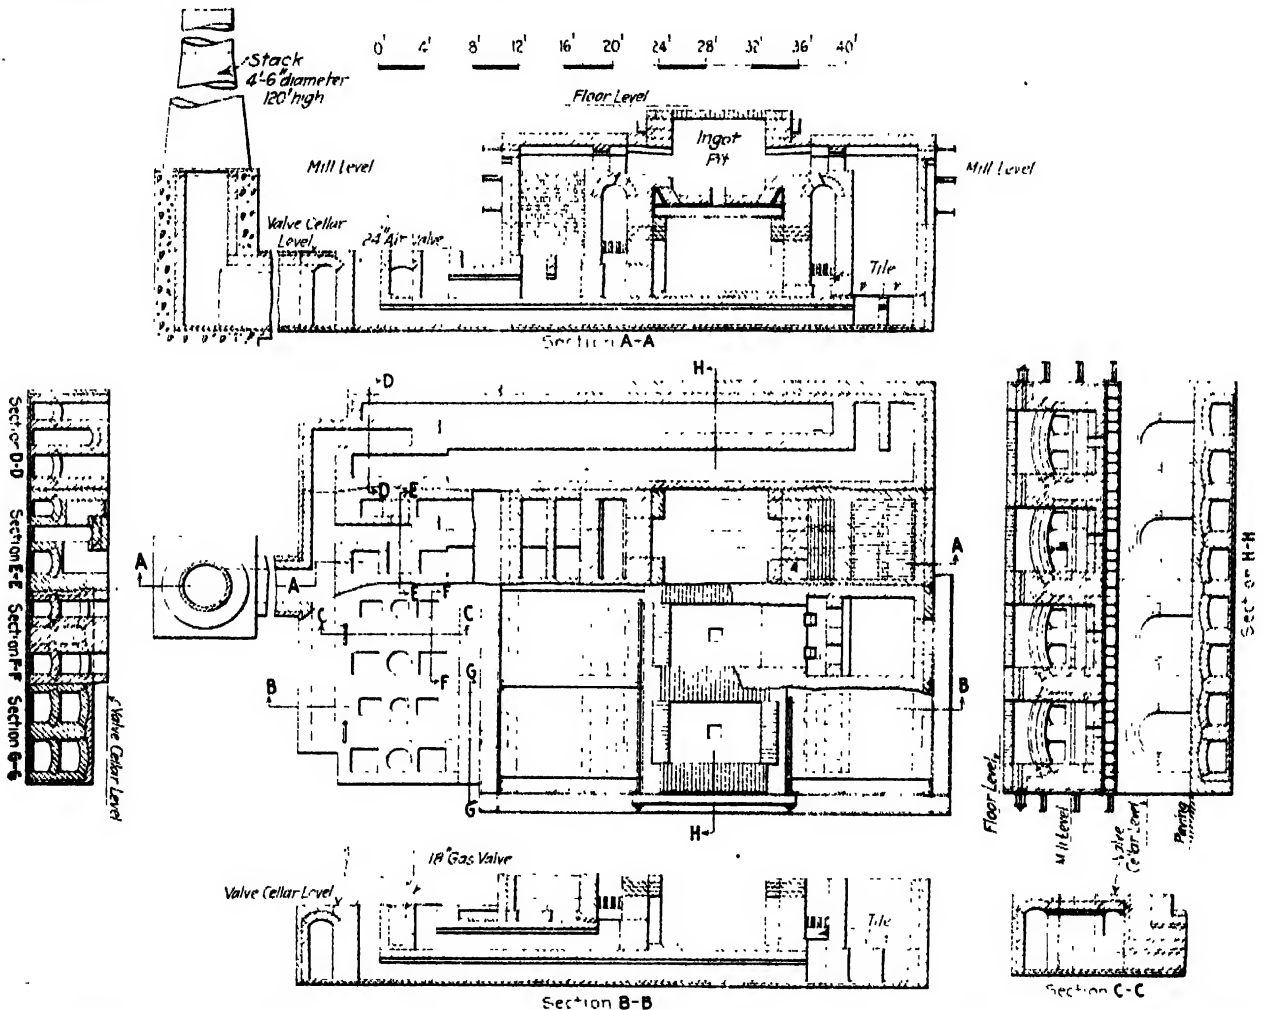

Improper and uncontrolled reheating of ingots, no matter whether they are charged hot or cold into the typical or standard soaking pit furnaces, for the reheating before being delivered to the blooming mill for rolling into blooms, billets or slabs, or to the universal or plate mill for rolling direct into finished plates, has for years been a bone of contention, comment, unfavorable criticism and misunderstanding between the open-hearth operatives producing the steel, and the soaking pit and blooming mill operatives heating and rolling the steel into semi-finished or finished products, all of which contention is to a large degree unnecessary.

After many years of study and experience, both in

after completing the rolling process. The reasons or causes for the majority of these maladies or troubles are improper combustion, lack of heating control and poor mixture of the gas and air before entering the pits.

The drawings show that producer gas is not regenerated; nor is coke oven gas or natural gas. These gases are introduced through slots or ports in which no checkers are placed. When producer gas is used, the reversing valves simply act as a means of diverting it from one side of each soaking pit to the other, and have no connection with the flue leading to the stack, thereby preventing leakage thereto.

All the waste gases leaving the soaking pits pass through the air regenerators only, which are increased somewhat in volume. Therefore, the air is pre-heated to the highest point of efficiency and is introduced through one or more ports or openings, directly over the incoming non-regenerated producer gas, at a point from 4 to 5 ft. before the admixture of the gas and air,

Horizontal, Longitudinal and Transverse Sections of Reheating Furnace, Showing Passages Traversed by Gas and Air

building and operating soaking pits, conclusions have been arrived at which warrant the statement that at least an average of 85 to 90 per cent ingot yield from open-hearth practice can be assured, and considered as good grade and marketable steel. In our judgment, the real trouble commences when the ingots are introduced into the soaking pits, through imperfect and uncontrolled reheating, whereby the ingots are subjected to hot gas and air pockets, streaks, waves of flame, which burn, cut or blemish different parts of the ingot, without properly or uniformly reheating or soaking the ingot at top, bottom and through to center. This causes a heavy jacket or scale formation around the ingot, which means excessive oxidation, honeycombed, pitted, scabby and spongy surfaces, and these blemishes eventually find a permanent position within the steel

or combustion point, thereby assuring a uniform heat, clear flame and proper combustion. This is non-oxidizing, all of the gases being properly consumed within the pits, which is the proper place, and not passing through the checkers out to the stack, which is now the prevailing condition.

When using coke-oven gas or natural gas, the gas pipes are introduced through the sides of the pits directly under the bottom, into the gas slots, which have no connection with the stack. The gases pass up to the gas ports, where they come in contact with the pre-heated air introduced directly over them.

In this construction and type of soaking pit, the products of combustion are laid directly down and upon the soaking pit bottoms, thereby making it possible more easily to remove the cinder. Another feature is the fact that, where coke breeze is used in making bottoms for soaking pits, in ordinary and usual practice,

*President, S. R. Smythe Co., Pittsburgh.

the bottoms chill to such an extent that a considerable amount or quantity adheres and freezes to the ingot bottoms, and is withdrawn with each ingot, especially when cold ingots are charged, which is quite an expense and nuisance. This type of soaking pit eliminates these conditions materially.

Letters patent have been secured upon the improved soaking pit furnaces here described, several of them have been built and are in operation, and the results speak for themselves. Any existing pit furnace can be changed to this principle. The same principle is applicable to other types of furnaces, and for reheating the semi-finished billets, blooms and sheet bars to produce their various finished products.

Very little attention or study has hitherto been

given to improving the method for reheating steel in its various forms and stages of production, and it can safely and conservatively be said that at least from 50 to 60 per cent of the troubles and imperfections known to us and to the steel producer are not from making of steel or ingots, altogether, but from imperfect and improper treatment and reheating.

The features above referred to are materially improved in this type of soaking pit furnace, and it can be shown and proved that uniform reheating and high efficiency are obtained with a minimum fuel consumption, maintenance, consumption of bottom material, loss by oxidation, practically smokeless stacks, and furthermore, the blooms, sheet bars and plates have homogeneous, smooth and clean edges and surfaces.

Automatic Double-Spindle Disk Grinders

The Gardner Machine Co., Beloit, Wis., has brought out an automatic double grinder, designated the No. 1, intended for the rapid grinding of two opposite sides of a piece simultaneously.

Parts which are particularly adapted to this type of grinding machine are piston rings, ball and roller bearing races, sad-iron sole plates, thrust washers, gear blanks and other similar pieces. The new machine, which is designed for greater production than possible with the hand-operated type, is automatic in operation and of the continuous feed type. It differs in several features from the ordinary double-spindle disk grinder and is intended to permit of much greater accuracy.

The spindles are parallel and placed in an off-set relation, as shown in the illustration. When the grind-

By Means of Metal Inserts. Openings in the Work Carrier May Be Made to Conform to Hold Work of Various Shapes

ing requires the use of coolant, the grinding members consist of 24-in. diameter abrasive ring wheels carried in special chucks. For dry grinding 24-in. steel disk wheels, faced with the company's improved abrasive disks, are used.

The work is carried to the grinding position by a work carrier which passes between the grinding members. The carrier has a range of feeds from 6 to 40 pieces per min., which is intended to accommodate a variety of work, from pieces with a large surface requiring the removal of considerable stock, to those of small areas requiring a light cut. The work carrier is provided with either 5 or 10 openings, to receive the work. As the work approaches the grinding position, one of the grinding members automatically advances, until it reaches a positive stop. This member approaches the work under an adjustable spring pressure, and consequently advances only as rapidly as the stock is removed, giving a constant pressure to the work being ground. It is returned to the open position by the action of a cam, and the work, as it passes out from between the wheels, is unloaded automatically. The cam also acts to govern the spring pressure feed.

Adjustment of the grinding members is by means of a hand wheel operating through a worm gear and screw. The hand wheel is graduated in 0.0001 in., to permit of extremely close adjustment. Truing devices are provided for dressing the faces of the cutting members and this, with the provision for accurately aligning the spindles of the machine, enables a high degree of accuracy to be obtained. Each grinding member is supported by the entire head. The thrust is carried by hardened and ground steel collars which bear directly upon the spindle bearings. In advancing to the work the entire head slides upon ways.

The automatic feeding device, shown in the illustration, is used to keep the work carrier loaded when the machine is in operation on work which permits of the higher rates of feed. When the larger work, requiring the lower feeding rates is being ground, the carrier is said to be fed more economically by hand.

The truing devices are an integral part of the machine and are ready for use at all times. Dressing does not interfere with the set-up, nor is it necessary to stop the machine to use the dressers. The spindles are of alloy steel, heat treated, and are mounted in bronze bearings of special design, adjustable for wear. Sliding surfaces are wide and the ways protected with shields to exclude dust and dirt. Sliding parts are amply lubricated and are provided with gibs to take up wear.

Rates Declared Unfair

WASHINGTON, Jan. 10.—Complaint has been filed with the Interstate Commerce Commission by the Parkersburg Rig & Reel Co., alleging that rates on fabricated and unfabricated plates and sheets, 12 to 16-gage, in straight or mixed carloads, with structural and other steel products named, including nuts, bolts, castings, and rods, applying from Parkersburg, W. Va., to eastern defined territories to all points in California, are unreasonable.

It is charged that they are excessive to the extent that these rates exceed the commodity rates on plates and sheets, 11-gage and heavier, which take less than the fifth class rate, while the latter is the rate applying to plates and sheets, 12 to 16-gage.

The complainant alleges that the rates charged are discriminatory in favor of shippers who fabricate plates 11-gage and heavier in the Mahoning and Shennango valleys, the Pittsburgh district, Kansas City, Mo.—Kans., St. Louis, Chicago, Denver, and other points.

In association with the National Research Council and other scientific and technical bodies, the Bureau of Standards is interested in formulating a program on a comprehensive scale for the study of the fundamental phenomena relating to corrosion. A steering committee has been appointed, and it is expected that investigation of this difficult subject will be encouraged in several centers, according to a definite plan to be decided upon.

The Black & Decker Mfg. Co., builder of portable electric tools, announces that effective Jan. 3, it will make a freight allowance on shipments of 100 lb. or over to points in the United States and Canada.

Production and Yield of Rolling Mills

Dependence of Material Yield on Oxidation and on Bloom and Billet Cropping—Temperature Limitations Govern Reheating

BY JOSEPH F. SHADGEN

(Continued from page 46, Jan. 5)

OF the greatest importance is the fact, well recognized to-day, that the ratio of operation has the large influence on determining the power demand per unit rolled, as a mill running light takes 50 per cent of the current required for full operation. This can be checked up on the chart of any registering wattmeter, and explains the basis of the efficiency of continuous mills, and incidentally a leading reason for their adoption. It follows logically that by all means a mill should be operated at full capacity, and it is logical, because it is more economical to provide two 8-hr. shifts working 90 per cent than it is to have three 8-hr. shifts working 60 per cent. The present low load factor is of course one of the main reasons for present high production costs.

The author wishes, in concluding this division of the subject, to give credit to numerous sources (proceedings Association of Iron and Steel Electrical Engineers, *Revue de Metallurgie*, *Stahl und Eisen*, *THE IRON AGE*, etc.), out of which part of the underlying data of the above compilations were compiled.

Material Yield

The rolling process entails a certain loss of material that, as suggested, is an important item of the operating cost. The yield of a mill is usually expressed as a percentage of the weight of the material fed into the rolls. To say the yield of a blooming mill is 91 per cent means that, of 100,000 lb. of ingots, finished blooms weighing 91,000 lb. are produced; or, in other words, to secure 100,000 lb. of blooms requires the supply of 109,890 lb. of ingots.

Reasons for loss of material in the rolling process are (a) the oxidation loss in the furnace and mill, and (b) the loss through rolling, including a loss due to the quality of the material.

Losses due to heating, while partly inevitable, should be kept low by close supervision of the furnaces. The amount of steel oxidized is a function of the flame control of the heating device, the length of exposure to the heat and the weight of the ingot or bloom. If the flame or hot gases that supply the heat are of a reducing nature, the loss is naturally smaller than if they carry a surplus of oxygen attacking the metal. Hence the first requisite is to devise proper flame control, and this need explains the present tendency to use gas-fired furnaces, and the vogue of pulverized fuel utilization, permitting easy and instantaneous changes in the condition of the flame.

That the time of exposure influences oxidation is obvious because, the longer the steel is in contact with the gases and the furnace bottom, the greater are the chances of producing scale and slagging. The weight of the material is of importance insofar as it usually fixes the ratio of exposed surface to the total volume of metal, and because the interior has to be heated thoroughly to avoid unexpected rolling resistance and possibly breakage of the mill. It follows that the time of exposure is usually a function of the cross section of the material to be heated, but the bringing to temperature should be done as quickly as compatible with the nature of the steel.

The limit of temperature is governed also by the

quality of the material (1200 to 1800 deg. C., or 2200 to 2375 deg. Fahr., for soft steel and 950 to 1050 deg. C., or 1750 to 1925 deg. Fahr., for high-carbon steels, etc.). If the steel is fed hot to the furnace, as for instance in the form of freshly stripped ingots, the time of heating is considerably reduced. The loss due to scaling varies from $\frac{1}{2}$ per cent of the weight up to 3 or 4 per cent, and should never exceed 4 per cent.

The blooming mill loss is usually small, because the pit furnaces receive hot stock directly into the cast house, the time in the furnaces varying from 1 to 2 hr. according to the size of the ingot. In Europe in non-heated pits it is customary to figure on a 1-per cent scale loss, and in heated furnaces on 2 to $2\frac{1}{2}$ per cent; in the United States $2\frac{1}{2}$ to 3 per cent is a fair average. for all ingots above 14 in. square in cross section. If cold ingots are to be reheated, the soaking time varies from 2 to 3 hr. and the loss in weight averages $3\frac{1}{2}$ per cent.

Blooms and billets are heated relatively quickly. If put into the furnace hot direct from the bloom or billet shear, $1\frac{1}{2}$ per cent scale is good performance, while for cold stock $2\frac{1}{2}$ to 3 per cent is the average. For slabs 3 per cent is a fair figure, because they are bulky and lie flat on the hearth, thus exposed to the slug forming action of the bottom. Continuous furnaces of the pusher type should give better results than the side door furnaces. In Europe furnace builders often guarantee a definite maximum loss to back up their claim of superior regulation of their construction.

Rolling Losses

Losses through the rolling operation consist in the inevitable cropping of ends, cobbles accidents in handling the material in and out of the rolls, cold spots, etc. The lengths of the charged sections are figured to yield definite lengths of finished product plus a small safety factor, usually 2 to 3 per cent, to avoid short lengths. In small mills, where material loops from one pass into another, the accidents create that amount of scrap, entailing additional loss. While in a blooming mill or a rail mill 3 to 5 per cent total loss is normal, on bar mills it commonly reaches 5 to 8 per cent, and on wire mills, 7 to 10 per cent. In plate mills and sheet mills the losses are correspondingly larger, because the finished product has to be cut to size in two dimensions, length and width. The average loss is 15 to 25 per cent, though for universal plate mills 8 to 15 per cent is good practice. Inspection influences the yield, and much depends on the interpretation of specifications and the rigidity of their application.

The third influence creating a loss of material in rolling mills is the quality of the ingots. This has to be dealt with separately, because of its importance from a tonnage standpoint, and because it should not be charged as a factor of blooming mill performance. In large plants the loss due to quality affects primarily the blooming mill, but is, in a measure, beyond the control of the rolling operatives and, as suggested, should be regarded as a separate item. If the ingots are sound, the crop ends at the shear are normal, but if the ingots are infected by blowholes, piping, segregation and other ills, the loss at the bloom shear increases

rapidly, and amounts often to 12 to 15 per cent as a year's average. This means that no less than one-seventh of the ingots cast are rolled to become scrap, or that one-seventh of the heat, power and labor of rolling are spent for nothing, a direct loss and an undeniable waste.

It follows that the material yield is a pretty accurate and severe measure of the quality-performance of the steel-plant that supplies the ingots. While in Europe a 90 per cent total yield of the blooming mill (scale loss $1\frac{1}{2}$ per cent; crop ends $8\frac{1}{2}$ per cent) is considered the average loss, and while many well-managed plants average 8 to 9 per cent over some years of operation, here in the United States it is not uncommon to find an average between 12 and 15 per cent, showing conclusively that there are opportunities for improvements. Experts like De Loisy, in close touch with the achievements in France, figure on only $3\frac{1}{2}$ to 5 per cent loss for cropping (total loss about 7 per cent), and in Germany a number of plants show 8 per cent as the total loss, or a yield of 92 per cent, over years of operation.

It has been conclusively demonstrated that large ingot sections increase the bloom shear loss, and today, with accurate ways of measuring all factors in-

loss produces furnace slag, and the roll mill loss furnishes scale, both of which can be sold, and the crop ends have a value as scrap. This should be credited to the cost of production.

If the power factor per ton of finished product is desired, the data already given must be multiplied by the yield of each mill. Tables II and III give the net operating cost of various products for a pre-war year;

Table II.—Yields and Quantities Based on One Net Ton of Product, Rolling from Ingots

	Bloom		Slab		Rail		Billet	
	Bess.	O.-H.	Bess.	O.-H.	Bess.	O.-H.	Bess.	O.-H.
Ingot Weight, lb.	2223	2378	2319	2420	2717	2585	2385	2451
Yield, per cent	90.0	84.0	86.3	82.4	73.5	77.4	87.5	81.5
Scrap recovered, lb.	172	318	272	364	652	533	238	393
Cost, Cents per Net Ton								
Fuel	7	13	7	9	15	29	13	19

Total	65	87	85	95	215	230	142	142

these are based on the returns of rollings amounting in a year to a million tons in each case except for plates. The conversion cost is decidedly affected, as already stated, by the ratio of output to input, and it seems contradictory or unwise to spend a considerable effort of energy and capital to save a few cents on the power factor, while other losses, particularly the matters of scaling and cropping, are accepted philosophi-

Table I.—Average Operating Data of Various Mills

involved, the tendency is noticeable toward smaller ingots. It is also conceded that blooming down the metal does not improve the quality of the steel very much. The forging action of the process and the increase in density, etc., are rather intangible points that do not always stand close analysis. The logic that the first requisite is sound ingots attracts more followers every day. The overworked slogan of many plants, "production first," should be revised, "quality first, production next."

Table I gives the average results of yields for various mills. The secretiveness of many operating departments on this subject should give way to a broadminded discussion for the ultimate good of the industry.

It must of course not be forgotten that the furnace

cally as inevitable. Progress has undoubtedly been made in the last few years, but it is undeniable that the bettering of blooming mill performance offers to the American operator the best opportunity to reduce leaks, and thus to realize a material saving in cost of operation.

Rogers, Brown & Co. Conference

The annual conference of the members of the firm of Rogers, Brown & Co. with their branch office managers, was held in Cincinnati, Jan. 5 and 6. The sessions opened with a luncheon at the Business Men's Club, to which all members of the firm, branch office managers and local salesmen were invited. On Thursday evening all were present with their wives at a dinner at the home of D. B. Meachem, president of the company. During the evening, Wm. A. Rogers, senior member of the firm, gave an interesting account of his experiences on a recent four months' trip to South America. Mr. and Mrs. Rogers crossed over the Andes Mountains where few white people had ever been before, and Mr. Rogers' account of their trip was a thrilling one. Stereopticon views of scenes along the route were shown. On Friday the guests were again entertained at luncheon at the Business Men's Club. Business conditions during the past year and the prospects for the future were discussed at the conference. It was the general opinion of the members of the firm and the branch managers that this year will show a great improvement over 1921. All indications seemed to point that way in the opinion of those present, and while not unduly optimistic, they all felt that in the last half of the year, conditions in the iron and steel industry will travel a long way back to normal.

New Machine for Making Hot Pressed Nuts

A new machine which, it is claimed, will produce hot pressed hexagon nuts with only 10 per cent waste, as against 50 to 60 per cent by other methods, has been developed by the Acme Machinery Co., Cleveland. The lowering of the percentage of waste in material is accomplished by means of indenters which indent the bar and thus avoid the side scrap.

A nut bar of special section is used which in the first operation is deeply indented on both sides, forming symmetrical angles of 60 deg., one on each side of the bar. As the indenters withdraw, the cut-off slide

Hot Pressed Nut Machine. A nut bar of special section is indented on both sides, the blank sheared off and carried into the die. The nut is then formed, punched and ejected

advances, shearing off the blank and carrying it into the die box. Two punches then advance from opposite sides, going part way through the nut blank and compressing it in the center. The surrounding metal flows and fills all parts of the die, producing the sharp corners on the blank and the crown as well. One of these punches then punches out the core, after which the nut is ejected from the die.

The machine, as shown in the illustration, is of simple design and all parts are easy of access. The bed is an open-hearth steel casting and the gear wheels are of steel with cut teeth. The main slides are protected by the gibs, which serves to preserve the alignment of the guideway and minimize the cost of maintenance. The tools and punches are of simple design and are made of air-hardening steel. The machine is equipped with a simple automatic relief device that prevents undue strain during operation.

Four sizes are made, the capacity of the smallest machine being $\frac{3}{8}$ to $\frac{1}{2}$ in., and that of the largest, 1 to 2 in. The strokes per min. for these machines is 70 to 75 and 35 to 40 respectively.

Antidotes for Carbon Monoxide Poisoning

Carbon monoxide poisoning is one of the most frequent causes of industrial accidents, says the United States Bureau of Mines. It is an ever-present danger about blast and coke furnaces, smelters and foundries. There appears to be no uniformly recognized treatment for a person overcome by carbon monoxide. In the rescue work of the United States Bureau of Mines, however, a method has been developed which has been supported by laboratory investigation, and has proved successful in practical experience over a period of years.

The first and most important thing in caring for a case of acute carbon monoxide poisoning is to get the poison out of the blood. Every moment that it shuts the oxygen out of the hemoglobin adds to the chances for failure of respiration and failure of the heart. Every minute that the tissues are supplied with only a part of the oxygen they need increases the danger of their degeneration and permanent damage.

The first step is to get the victim away from the

atmosphere of carbon monoxide; the next is to supply him with oxygen. Fresh air is one-fifth oxygen. If a tank of pure oxygen is available, it is far better to use it, as the action is much faster and the after-effects, especially the headache, are much less severe.

All ambulances should be equipped with oxygen tanks. When the victim's breathing has stopped, or is very weak and irregular one of the rescuers should begin artificial respiration by the Schaefer method at once.

Continue artificial respiration, if necessary, for at least three hours without interruption, or until natural breathing has been restored or a physician has arrived. Even after natural breathing begins, carefully watch that it continues. If it stops, start artificial respiration again.

The patient should be kept quiet and lying flat to help his weakened heart. When he revives he should not be allowed to walk about or in any way exert himself, for there is danger of heart failure. Heat from safety lamps, hot-water bottles, or warm bricks, rubbing the arms and legs, and keeping the patient well covered with blankets all help the circulation and aid in tiding the body over a period of low vitality. The safety lamps, hot bricks, etc., should be well wrapped in cloth or paper as a precaution against burning the patient. Other stimulants, such as hypodermics of caffeine-sodium benzoate or camphor in oil, should not be administered except by a doctor, after he has considered the possibility of over-stimulation and consequent collapse. The patient should be kept in bed for a day at least. Later he should be treated as a convalescent, being given plenty of time to rest and recuperate. Just how long this time should be depends on the severity of his poisoning and should be decided by his physician.

Details of methods employed in the treatment of carbon monoxide poisoning, including a description of the Schaefer method of artificial respiration, are given in a report which may be obtained by applying to the Bureau of Mines, Washington.

New Interchangeable Spot Facer

An interchangeable spot facer intended to meet the demand for a low priced and economical production tool has been placed on the market by the Eclipse In-

The Boss on Cutter Fits Hole in Holder

terchangeable Counterbore Co., Detroit. It is known as the Junior and the component parts are shown in the illustration.

The complete tool consists of a nickel steel holder, an externally and internally threaded nut screwed into the holder, a high-speed steel spot facer with milled flutes and a machine-steel pilot. The ground boss on the spot facer fits into the hole in the holder, serving to align both accurately. The pilot nut is screwed into the holder and permits of instant removal of the shank of the pilot in case of breakage. The pilot nut may also be removed and replaced with one having a smaller internal thread, permitting the same holder to be used with many different pilots and spot facers. The end of the pilot head has a screw driver slot and also flats for removal by pliers or wrench.

The new tool can be used with standard Eclipse holders and standard pilots by using an adapter. Several sizes of spot facers are made from $\frac{1}{2}$ to 3 in., and the shank of the holder is made with a No. 2, 3 and 4 Morse Taper. The tool is also furnished without pilots.

The Studebaker Corporation, South Bend, Ind., made a new record for production, the week ending Dec. 21, when 1080 automobiles were completed. More than 7000 men are employed in the company's South Bend plants.

New England Foundrymen's Association Annual Meeting

The New England Foundrymen's Association held its twenty-sixth annual meeting Wednesday evening, Jan. 11, at the Exchange Club, Boston, with a new high record attendance. C. S. Lovell, president, presided. He was succeeded, in the election, by E. H. Ballard, General Electric Co., Everett, Mass. Mr. Ballard, formerly vice-president of the Association, is succeeded by George A. Ray, Taylor-Fenn Co., Hartford, Conn. George H. Gibby, Gibby Foundry Co., East Boston, and Fred F. Stockwell, Barbour-Stockwell Co., Cambridge, Mass., were re-elected treasurer and secretary, respectively. The executive committee consists of Charles A. Reed, Reed, Pears & Miller, Boston, pig iron and coke; L. M. Sherwin, Brown & Sharpe Mfg. Co., Providence, R. I., small tools and machine tools; Harry T. Welch, Milford Iron Foundry, Milford, Mass.; R. F. Harrington, Hunt-Spiller Mfg. Corporation, Boston, gun castings, etc., and Norman Russell, Albert Russell & Sons Co., Newburyport, Mass.

The meeting was called to order shortly after five o'clock, following which there was an informal reception. Dinner was served later in the evening at which Mr. Ballard presided. After-dinner professional talent, the New England Foundrymen's Association and the New England Coal & Coke Co. orchestras furnished entertainment and music. Charles A. Reed had charge of the arrangements.

First Meeting of Molding Sand Research Committee

The molding sand committee, recently organized under the auspices of the National Research Council and American Foundrymen's Association, held an interesting meeting in the Engineering Societies Building, New York, on Dec. 9. This was the first meeting of the whole committee.

Hundreds of thousands of tons of molding and core sands are used annually in the iron, steel and non-ferrous foundries of America. A large proportion of the expense involved is in the transportation of such sands and their handling in the foundry. A little of it is re-used; much more might be. Moreover, sands are not always correctly selected for specific purposes. Mixing and other treatment can secure improvement.

Under the direction of the Division of Engineering, N. R. C., and the American Foundrymen's Association, a valuable digest of literature has been made by Prof. R. E. Kennedy, University of Illinois, and distributed to the members of the committee and others interested. Practical foundrymen regard this as a most important treatise on the subject.

Three sub-committees are actively at work. The sub-committee on standard tests has reached agreement on six tests which will show the properties that are most indicative of satisfactory working conditions of the sand in almost all lines of foundry practice. The "fineness" test and "cohesiveness" test were reported as the two tests which should be given first consideration. Tests for permeability, water content, and thermal properties, and rational and chemical analyses, should also be considered in a general study of molding sands. The American Society for Testing Materials is to be invited to appoint representatives on this committee to help standardize the methods of making such tests.

The sub-committee on reclamation of old molding sands and greater use of old sands in molding and core-making operations is preparing a questionnaire for submission to the foundries which will bring out the proportions of sands reclaimed and the methods of reclamation.

The sub-committee on synthetic sands will confine its attention at first to mechanical means for mixing.

Under the guidance of Prof. H. Reis, Cornell University, cooperation will be secured from state geologists and the director of the U. S. Geological Survey, in making a thorough survey of sand deposits in this country that are suitable for foundry use. The cooperation

of men having like interests in Canada, England and Belgium has been secured.

R. A. Bull, Spondly Building, 639 Diversey Parkway, Chicago, has been elected chairman of the molding sand research committee, and Prof. R. E. Kennedy, 909 West California Street, Urbana, Ill., is secretary.

Practising Engineers Invited to Meet in Chicago

The American Association of Engineers will hold a conference of practising engineers at the Congress Hotel in Chicago, on Wednesday, Feb. 22. The tentative program includes the following subjects:

- How to sell engineering service.
- Experience of the practicing engineer with licensing:
 - (a) State reciprocity.
 - (b) Licensing of engineering corporations.
- Publicity for practicing engineers.
- Cost accounting for engineering service.
- Bookkeeping for an engineering office.
- How to uphold the standards of services and fees.
- Amendment of schedules of services and fees:
 - (a) Providing for other branches, such as mining and mechanical.
 - (b) To fit them to the practice appertaining to the several parts of the country.
- Computing the practicing engineer's income tax.

Ohio State Foundrymen's Association

The board of administration of the Ohio State Foundrymen's Association at a meeting in Cincinnati on Jan. 5, reviewed the report of the committee appointed to discuss a standard code of foundry practice. The report was returned to the committee for further revision and will later be presented to the entire membership for their criticism. It was decided to hold the next general meeting of the association at Cleveland during the session of the American Foundrymen's Association. This will be the annual meeting of the Ohio State Association and five new members of the board of administration are to be elected. President Weber appointed a nominating committee to compile a list of 10 men who will be balloted on for the positions on the board. Other business taken up at the meeting included the legality of the pig iron contract as approved by the National Association of Purchasing Agents. This contract was discussed in all its phases and was referred to the association's attorney for legal counsel and advice.

Chicago Engineers Will Consider Stabilization

The Chicago chapter of the Society of Industrial Engineers, will hold a series of eight meetings to consider and analyze the various phases of the "Stabilization of Industry." The meetings will be held on the second Tuesday of each month at the Auditorium Hotel, Chicago. Not only because stabilization has a special significance now, but because it has been and will continue to be a practical problem, the Chicago chapter has decided to open these meetings to the public. The first meeting was scheduled to be held on Tuesday evening, Jan. 10, with John W. Thomas, vice-president of the Central Trust Co., Chicago, as chairman. The speakers were announced as Dorr E. Felt, president of Felt & Tarrant Mfg. Co.; Maurice G. Gerard, industrial engineer of Gerard, Graham & Co., and Arthur J. Todd, labor manager of B. Kuppenheimer & Co., all of Chicago. The topic of the first meeting was "Business and Economic Need for Stabilization."

Research Progress in the Metallurgy of Aluminum

At the Pittsburgh Experiment Station of the United States Bureau of Mines, various problems in the metallurgy of aluminum and its alloys are being investigated by R. J. Anderson, metallurgist, aided by J. H. Capps, assistant chemist.

An investigation, made in cooperation with a number of foundries, of inclusions in castings showed that such inclusions, which are a source of much loss, could be practically eliminated by proper precautions. A report describing the investigation is being published by the bureau. Work is now under way on causes and

prevention of cracks—the most important defect in aluminum castings.

A general investigation of scrap losses in aluminum-alloy foundry practice showed that the annual losses in the United States amount to about \$1,200,000, and that universal adoption of methods recommended by the Bureau would probably result in a saving of about \$600,000 per annum. The complete results will be set forth in a bulletin to be issued by the Bureau.

Another proposed bulletin covers the various commercial methods for the preparation of aluminum-copper alloys; a paper prepared discusses gas atmospheres in melting furnaces; and a comprehensive bulletin on the manufacture, properties and uses of aluminum alloys is in course of publication. A study of the melting losses in aluminum metallurgical practice and of the comparative efficiency of various types of furnaces has been completed. A preliminary report has been published by the Bureau in mimeographed form and the complete results have been prepared as a bulletin.

A paper entitled "Iron-pot Melting Practice for Aluminum Alloy" has been prepared. This type of furnace was given special attention because of its general use for aluminum-alloy melting.

In the study of methods for determining aluminum and aluminum oxide in aluminum and aluminum alloys a new rapid method for the direct determination of aluminum has been devised and will be described in a bulletin in course of preparation.

In connection with the aluminum investigations, about 1000 macrographs and micrographs of samples have been prepared. A paper has been prepared by Mr. Anderson on "Ferric Sulphate as a New Etching Agent in the Metallography of Aluminum." Another paper entitled "Castings of Light Aluminum Alloys," deals with the macrography of light aluminum alloys, and a third paper, dealing with the faulty design of castings and the effect of columnar crystallization on cracks and other defects, has been written.

The section has co-operated with aluminum foundries, principally in the Detroit and Cleveland districts, in connection with general problems arising in the melting of aluminum alloys and in the founding of sand castings.

National Research Council Offers Free Information Service

The research information service of the National Research Council is prepared to supply to those interested information about scientific instruments, apparatus and supplies, laboratory construction and equipment. The following are samples of requests answered recently:

"Where may we purchase inexpensive photomicrographic apparatus?" "Where may a human skull be purchased?" "Who manufactures a good grade of selenium cells?" "Advise where lantern slides on European Geography may be obtained." "Where may the Lummer-Brodhun cube be obtained?" "What concern makes gages recording in fractions of an ounce?" "Where may apparatus and accessories for the study of sensitiveness of photographic plates be secured?"

Requests should be addressed to the National Research Council, Information Service, Washington.

Courses of New York University in Labor Handling

The School of Commerce Accounts and Finance, New York University, is offering two courses pertaining to the improvement of labor: One, devoted to labor and employment management, conducted by J. D. Hackett; the other, devoted to the principles and methods of training employees, conducted by J. W. Dietz, Western Electric Co.

The first part of the course conducted by Mr. Hackett, which will have been completed by Jan. 12, was given over to a discussion of specific methods of hiring the worker and placing him in his new position. The second part of the course will start Feb. 2. The following will be considered: Accident prevention, safety organization; fire prevention; medical and surgical care, emergency hospital, physical examination; hygiene; health conservation, ventilation, heating, hu-

midity, lighting; lunchrooms, cafeterias, food supply; sanitation, wash rooms, locker rooms, laundry, sanitary accommodations, cleaning; insurance, pensions, mutual benefits; wage systems, payment methods; profit sharing, stock ownership; hours of work; recreation, games, clubs; trade unions, strikes, collective bargains; industrial unions; industrial democracy and employees' representation.

The first part of Mr. Dietz's course was completed on Jan. 11 and dealt with methods of training minor employees, supervision of such training and the organization and administration of training departments. The second part will start Feb. 1 and will take up: The selection, training and development of technical experts, future executives, foremen and other members of the supervisory force, as well as the special methods used in training the instructors of such groups; co-operative and continuation schools; evening schools, both company and public, and other recognized auxiliary educational agencies; other features which contribute to the success of a training department, including the use of the house organ, library and methods of obtaining close and correct co-operation with trade and national associations.

Results of a Research on Fatigue of Steel

During the world war the question of the strength of airplane parts, and other problems of material under repeated stress, brought the whole subject of fatigue phenomena of metals to the attention of the National Research Council. The result was the organization of an investigation by the cooperation of the National Research Council Division of Engineering, Engineering Foundation, and the Engineering Experiment Station of the University of Illinois.

Bulletin No. 124 of the Engineering Experiment Station of the University of Illinois, entitled "An Investigation of the Fatigue of Metals," is a progress report of the first part of this investigation, having for its object the determination whether or not there exists any clearly defined relation between static properties and ability to resist repeated stresses. It having been decided not to enter the field of non-ferrous metals at this time, a series of tests of materials well scattered over the field of ferrous metals was made, and in most cases two or more distinct heat treatments for each metal were studied.

The results of these tests, and the conclusions to be drawn therefrom are given in Bulletin No. 124, copies of which may be had without charge by addressing the Engineering Experiment Station, Urbana, Ill.

New York Purchasing Agents to Meet

The Purchasing Agents' Association of New York will meet, at the Builders' Exchange Club, 84 West Thirty-third Street, New York, on Jan. 17. Francis H. Sisson, vice-president Guaranty Trust Co. and Jules S. Bache, J. S. Bache & Co., will be the speakers. Mr. Sisson on "Methods of Financing Export Trade," and Mr. Bache on the "Sales Tax." The members of the association as is the custom at the monthly meetings will hold a general discussion on the trend of the times.

COMING MEETINGS

January

Engineering Institute of Canada. Jan. 24 and 25. Annual meeting at Montreal. J. L. Busfield, secretary-treasurer Montreal branch, 260 St. James Street, Montreal.

February

American Boiler Manufacturers' Association. Feb. 13. One-day winter meeting. Fort Pitt Hotel, Pittsburgh. Secretary, H. N. Covell, 191 Dikeman Street, Brooklyn, N. Y.

American Institute of Mining and Metallurgical Engineers. Feb. 20-25. Spring meeting. Engineering Societies Building, New York. Secretary, Frederick F. Sharpless, 29 West Thirty-ninth Street, New York.

STRIKE RENEWED

Chicago Building Trades Council Rejects Landis Award and Stands by Carpenters

CHICAGO, Jan. 9.—The Chicago Building Trades Council has finally rejected the Landis wage award and decided to stand by the carpenters and other unions which have refused to abide by the terms of the award from the very first. Only one union, that of the bricklayers, stood out against the final decision of the council. All of the unions with the possible exception of the bricklayers, are expected to call strikes on all construction jobs where non-union labor is employed in any trade capacity.

The Landis arbitration award, which was announced last September, after an investigation of several months, was formally accepted by all unions except the carpenters and one or two other minor organizations. The failure of these recalcitrant unions to conform with the terms of the award finally led to the formation of a citizens' committee, composed of Chicago's most prominent business men, which set out to force those organizations into line. The decision of the building trades council, as explained by its leaders, was in the nature of taking up the gauntlet which they considered had been thrown down by the citizens' committee, which they believe was trying to make the Landis award a shield for the introduction of the open shop throughout the building industry.

Strike Conditions Improve

Strike conditions at the plant of the Newport Rolling Mill Co., Newport, Ky., are improving steadily. More mills are being operated each week and it will be only a short time before the full plant is in operation. Plans are now being made for a resumption of operations at the plant of the Andrews Steel Co.

Conferences are being held almost daily between officials of the rolling mill company and committees of the strike employees with Safety Director Thomasson of Newport, acting as intermediary. Prospects for settlement of the strike trouble are looking better, though nothing of a definite nature has yet come out of the conferences. Walter Larkin, international vice-president of the Amalgamated Association of Iron, Steel and Tin Workers, is in Newport and it is expected that the other executive offices of the association will also go to Newport and stay there until a settlement is reached.

What was apparently an attempt to blow up the plant of the Newport Rolling Mill Co. was frustrated by the vigilance of the National Guardsmen on strike duty there.

Wages in Iron and Steel

Figures prepared by the Bureau of Labor Statistics, and covering in 1920 a total of 155 plants and 59,960 employees, show the trend in the rise of earnings of employees in the iron and steel industry, which reached its culmination in the fall of 1920. The figures are based upon returns from 28 blast furnace plants, 11 Bessemer converter plants, 19 open-hearth furnace plants, 15 puddling mills, 20 blooming mills, 11 plate mills, 4 standard rail mills, 25 bar mills, 13 sheet mills and 9 tin plate mills. These ten groups employed in 1920, individually, from 1344 men in the 4 rail mills to 12,083 men in the 28 blast furnace departments.

Distinction is made in the 1920 figures between all employees and common labor. The average hourly earnings of the former were 76.6c., ranging from 57.1c. in the blast furnace departments to 103.9c. in the sheet mills. Common labor had a much narrower range, from 47.4c. in the blast furnace departments to 53.7c. around Bessemer converters, and an average of 50.8c. The marked differences in compensation of total employees depend largely upon the proportionate number of those employees who come under the classification of common labor. As this proportion is much heavier in blast furnace departments than in other departments, and relatively lighter in the sheet and tin plate mills, the wide divergencies in average earnings

of all employees as between these departments is explained.

In the chart, the average earnings of all employees in each of the ten departments are shown separately for 1920, 1919, 1917 and 1913, except that the 1917 figures for puddling mills, rail mills, bar mills and tin plate mills are missing. This diagram has, under each department, two shaded belts and two white belts. The top of the diagram represents the 1920 hourly earning; the bottom of the upper shaded section shows the earning for 1919; the top of the lower shaded section that for 1917 and the bottom of the lower shaded section that for 1913. From this it will be easy to compare department with department at any given date.

Colorado Conditions Improved

The labor situation at the plants of the Colorado Fuel & Iron Co., is improving steadily. An additional coal mine, closed by a sympathetic strike, has been reopened upon petition of the men and at the reduced wage scale. A few days ago, the company announced a 10 per cent reduction in wages at the steel works. Shortly thereafter the employees' representatives of the steel works asked the management to make the reduction effective Jan. 1, instead of Jan. 15, as had been announced in order that some of the departments which had been closed might be reopened at an earlier date. Under this new wage scale at the steel works, common labor is getting 33c. an hour.

Proposed Cut in Miners' Wages

Illinois coal operators at a meeting on Jan. 5, sent a telegram to John L. Lewis, president of the United Mine Workers of America, insisting that a meeting be held in the near future to consider a cut in miners' wages. The operators feel that high coal prices are delaying a revival in business and they wish to open negotiations covering the whole subject of wages and working conditions prior to the expiration of the present contract with the union on April 1.

Complaint of Cambria Steel Co. Is Dismissed

WASHINGTON, Jan. 10.—In a decision made public last Saturday, the Interstate Commerce Commission dismissed the complaint of the Cambria Steel Co. vs. Director General, Pennsylvania Railroad, et al., by holding that the denial of the defendants to the complainant of an allowance for spotting cars within its plant at Johnstown, Pa., equal to the cost of such service to the steel company, had not subjected it to the payment of unreasonable rates, or undue prejudice, or to damage.

The Pennsylvania and Baltimore & Ohio railroads in June, 1914, agreed to pay the steel company the cost of doing spotting work, with the understanding that it would not exceed \$2.19 per car. In 23 of the 25 months covered by the cost study of the steel company, the cost of performing the service was shown to have been in excess of the allowance, running as high as \$4 per car. It was shown by the steel company that costs of its railroad, like those on trunk lines, had increased. The commission, however, in its opinion, written by Commissioner Aitchison, said it has not the power to direct the payment of an allowance and therefore had no authority to direct an increase in the allowance.

New York Industrial Cost Meeting

The next regular monthly meeting of the New York section of the Industrial Cost Association will be held Thursday evening, Jan. 19, at Keen's Chop House, 72 West Thirty-sixth Street, New York. The meeting, at 8 p. m. sharp, will follow dinner at 6.30 p. m. The subject for the meeting will be "Chronometric Valuations or What the Business Man Should Know about Invested Capital, Depreciation, Amortization and Amended Returns." William F. Worcester, vice-president Lloyd Thomas Co., appraisers and engineers, will make the address, after which the meeting will be opened for general discussion.

German Attempts to Fix Steel Prices

So-called Guiding Prices Still Obtain—Scheme of Plan of Maximum Prices Detailed—Production Checked by Strikes and Exports by Competition

(Special Correspondence)

BERLIN, GERMANY, Dec. 18, 1921.—The stubborn fight for the reintroduction of official maximum prices waged by labor has come to a halt for the time being. It will be recalled that the Minister of Economics has been examining production costs at furnaces and rolling mills and on the strength of the data thus obtained proposed the fixing of maximum prices for ingots, blooms, billets, rails, bar iron and light plates, at a considerably lower level than the current so-called guiding prices. Contrary to expectations, the Government refrained from submitting definite proposals when the subject came up for discussion at a recent meeting of the Iron Control Federation but instead suggested that the meeting should put motions in this respect. Labor thereupon moved the reintroduction of maximum prices but this motion was defeated by the opposition of producers, the trade and consumers and the most astonishing part of it was that some labor delegates went over to the opposition.

In view of the prevailing conditions it was decided to continue for the time being the system of guiding prices at present in operation. This system, it was held, offered the industry and trade more elbow room especially in regard to long-term contracts.

The fixing of guiding prices will henceforth be in the hands of an appointed committee composed of representatives of producers, the trade, consumers and labor. The current guiding prices remained in a way unchanged but for the increases due to the advance of coal prices on Dec. 1, by which iron prices automatically advanced by 3.50 m. per ton for each mark of coal price increases. The augmented guiding base prices are now as follows:

So-Called Guiding Base Prices in Germany

Ingots	3,830
Blooms	4,130
Billets	4,230
Sheet bars	4,330
Structural shapes	4,930
Bar iron	5,030
Universal iron	5,480
Hoop iron	5,530
Wire rods	4,30
Sheets, No. 6 U. S. A. gage and lower	630
Sheets, No. 6-11 U. S. A. gage	430
Plates, No. 11-20 gage	680
Plates, below No. 20 gage	830

Plan to Figure Prices on Costs

Though the maximum price question has thus been abandoned, or at least shelved for the present, it may nevertheless be of interest to give some space to the system of price calculations as formed the basis for the maximum price policy by the Government. The suggested prices were based (a) on a rate of exchange of 100 m. for one Dutch florin, (b) a scrape price of 3100 m. per ton (this has meanwhile receded) and (c) besides allowing a fair and reasonable quota for the replacement account, included profit at the rate of 5 per cent. Moreover, the principle of utilizing part of the so-called "valuta" profits accruing from export sales was to be revived for the cheapening of domestic prices. (The respective amounts for the different grades were already considered in the proposed maximum prices.)

The calculation and distribution of this valuta profit may be illustrated in the following example: Average production costs for bar iron, including profits, etc., and allowing for the increase of coal prices as by Dec. 1, were found to be slightly less than 5000 m. per metric ton. Figuring on an export price of 90 Dutch florins and converting at the rate of 100 m. for 1 florin, the valuta profit would work out at about 4000 m. per ton. Of this extra profit, the Minister proposed that 75 per cent, equal in this case to 3000 m., should go toward lowering the price of the material in the home market,

while the remaining 1000 m. were to be the clear profit of the exporting firm.

Assuming that, in face of the difficulties in the way of an adequate supply of the domestic market, only 20 per cent of the total output be available for export in the future, the ratio of export to domestic sales would be 20 per cent to 80 per cent, or 1:4. The aforementioned amount of 3000 m. would therefore permit of a cheapening of domestic prices by $3000 \div 4 = 750$ m. per ton, so that the proposed maximum price of 5000 — 750 = 4250 m. was justified.

This method of calculating prices and profits has come in for sharp criticism in interested quarters. The ratio of exchange of 100 m. for one florin is held to be absurd (as a matter of fact the mark has improved since the publishing of the Minister's figures) and the whole idea of inserting an ever fluctuating exchange rate as a factor in such price calculations was declared to be unworkable. The ratio of 1:4 for export and domestic sales was also subject to doubt as the export percentage is held to be below 20 per cent.

Market Strong But Speculative Buying Ceasing

Despite the recent notable appreciation of the mark, the considerable drop in industrial stocks and the sudden discontinuance of the buying craze in all commodity markets, the iron market is still continuing strong. With very isolated exceptions, demand has not lost any of its keenness so far, but it is noteworthy to point out that speculative buying has almost entirely ceased. There are distinct signs of the weak element in jobbers' circles losing nerve, as instanced by the increasing number of advertisements for spot stocks in the daily press.

Interest in the export business seems to have diminished somewhat of late, as the profit margin has been narrowed down by the improvement in the German exchange and export sales are no longer offering that strong incentive they did some weeks ago. A certain tonnage will, of course, nevertheless have to be exported in order to obtain the required amount of foreign bills for the import of raw materials. The slight reticence on the part of foreign buyers is ascribed to the prevailing political uncertainty.

Large Production Loss Through Strikes

The loss in production due to the recent strikes now turns out to be larger than was at first estimated and is now given at some 100,000 tons. The Duisburg works was laid idle for about eight days toward the end of October. The strike of the engineers and firemen at the two Dortmund plants has made doubtful the resumption before February of one of the works on the pre-strike scale. The strike at Düsseldorf, which ended with the defeat of the workers, lasted for three weeks and affected four steel producing works. Resumption of steel production will not be until the beginning of the new year.

The Witten Cast Steel Works had to close down last week for want of coal, after having operated on short time the week before, and a report has just come to hand that the Thale Iron Works had to close in part for the same reason. Krupp's also complain. According to a statement by the management, only 30 per cent of the coal raised at their own collieries is at their disposal, while the total quantity with which they are supplied amounts to 76.5 per cent of the required tonnage only. Owing to this coal shortage, steel production at the works has dropped to 65 per cent of the pre-war output during the latter months.

Exporting Quieter

A somewhat quieter tone obtains in the wire export market where business has been extraordinarily brisk

during the past weeks. Demand is still active, however, especially for barbed wire and fencing wire, which are being bought by South Africa and Argentina at prices averaging £18, f.o.b. Hamburg, for barbed wire. The base price of £12, f.o.b. Hamburg, for galvanized wire, is showing signs of softening as a result of Belgian competition. A falling-off in the wire nail business with Japan is noted. Dutch exporters have lately placed some nail orders for the Dutch Indies at 15 to 16 fl. per 100 kg., f.o.b. Hamburg.

Export prices of wire for netting to the United Kingdom are by about 10s. lower, quotation now being in the neighborhood of £14 per ton, f.o.b. Rotterdam. Here, too, Belgian competition is being felt. A gain in business with the Scandinavian countries is reported, but prices, it is complained, leave next to no "valuta" profit.

A feature of the sheet market is the slump in inquiries for heavy gages. The strong demand for light plates continues. Tubes were quieter but for some buying in boiler tubes and a falling off in demand for gas pipes is largely accounted for by quiet in the building trades due to frost.

During the past week we quoted as follows, average prices per metric ton, unless otherwise observed:

German Quotations on Finished Products

Bar iron	6,700 m.
Channels	6,600 m.
Angles	7,200 m.
Z-iron	6,700 m.
Sheets, Heavy	7,200 m.
Sheets, Medium	9,500 m.
Wire rods	8,750 m.
Wire, bright, base, per 100 kg.	900 m.
Wire, galvanized, base, per 100 kg.	1,100 m.
Wire nails, base, per 100 kg.	1,100 m.
Toes	6,500 m.
Rounds	6,550 m.
Flats	6,650 m.
Hoop iron	6,450 m.
Hoop iron, box band quality.	11,400 m.
Plates, light, according to gage.	13,500 to 15,500 m.

Sale of Materials at Hog Island

WASHINGTON, Jan. 10.—Announcement has been made by Sidney Henry, commercial manager of the United States Shipping Board Emergency Fleet Corporation, that the tentative program outlined for the first half of January by the material sales division embraces negotiations of sale of a number of materials, among them wire rope and cable, the first lot of steel at Hog Island, aggregating about 6000 tons, and machine tools, at Hog Island. At the Bethlehem, Pa., plant of the Bethlehem Steel Co., the Fleet Corporation has about 647 tons of fabricated steel, at the company's Steelton, Pa., plant there are about 900 tons of plain steel, and at the Harland shipbuilding plant, Wilmington, Del., there are approximately 1300 tons. All of the small and pneumatic tools will be segregated and classified within two or three weeks and ready for sales negotiations. During the week of Jan. 15, reclassification of approximately 22,000 tons of valves and fittings at Hog Island will begin and it is expected that by the latter part of the present month the Fleet Corporation will be in a position to sell all materials of this grade.

Sale of Cartridge Cases

WASHINGTON, Jan. 10.—Through the agency of the Philadelphia District Ordnance Salvage Board, Frankford Arsenal, Philadelphia, Pa., there will be offered for sale under sealed bids approximately 5,600,000 lb. of surplus cartridge cases of various sizes and components. Bids will be received not later than 12 o'clock noon Jan. 19. It is estimated that the cartridge cases analyze 68 per cent copper and 32 per cent zinc, but no guarantee is given regarding the percentage of copper and zinc content. All material is to be sold in its present condition, on board cars, at the respective plants where located and as shown.

The Allegheny Steel Co., Brackenridge, Pa., has started up after a shutdown of several weeks. Three open-hearth furnaces are making steel preparatory to starting up 10 sheet mills, on Jan. 17, on a 4-day-a-week schedule.

PITTSBURGH BASING CASE

Steel Corporation Files Answer to Amended Complaint Denying Discrimination in Prices

WASHINGTON, Jan. 9.—Denying charges of discrimination in prices made to its purchasers of different rolled steel products and declaring that the suggested order of the Federal Trade Commission in the Pittsburgh base case would be contrary to the fifth amendment of the Constitution, the United States Steel Corporation last week filed an answer with the commission to the latter's amended complaint. The Steel Corporation, through its general attorney, William W. Corlett, asks that the complaint be dismissed. The answer of the corporation contains but little new matter over and above that incorporated in its original answer, in which it denied charges made by the commission in connection with the general practice in the trade of using Pittsburgh as a base for naming prices.

The amended complaint, according to the commission, was issued in order to simplify the issue and expedite the hearings. The original complaint charged the corporation and its subsidiaries with discriminating in prices among purchasers of rolled steel products. The amended complaint makes precisely the same charges with respect to each particular rolled steel product and sets up the claim that the alleged discriminations are in violation of the Clayton and Federal Trade acts, for the reason that they are not made because of any difference in the grade, quality or quantity of the grade sold, nor because of the difference in cost of selling and transportation, nor because the price was made in good faith to meet competition.

The corporation's answer specifically mentions each rolled product in which price discrimination is charged, and denies each and every allegation, but concedes that the subsidiaries do charge different prices at different times and in different localities and commodities, according to the market price prevailing in the different localities and communities at the time of sales.

The answer states that the different prices are not made on account of differences in the grade or quality and that generally such differences in price are not based on differences in the cost of selling such products, but on difference in the cost of transportation, although in many cases they are. It is stated that such different prices are made in good faith on account of the quantity furnished to meet competition and representing the market prices prevailing from time to time.

Answering another charge, it is stated that to the extent, if any, that Western and Southern consumers may be unable to compete with Eastern consumers of the sale of different products mentioned, and particularly Pittsburgh consumers of such products, such limitation is due to their geographical position, and to the normal and natural market prices for steel prevailing in the different localities and is in no wise due to any unfair, improper or unlawful discrimination against Western and Southern consumers. It is asserted that the fabricators located outside of the Pittsburgh district are and always have been free to locate wherever it appeared to them that their business could be conducted most profitably.

Replying to a charge that the so-called extra price "extorted" through the alleged discriminatory price system applying to public works throughout the United States, which the commission says aggregates a large sum which the general public must pay through taxation, the Steel Corporation makes a sweeping denial, and particularly with reference to the charge of extortion.

In its concluding paragraph, the corporation's answer says that "an order of the kind or effect suggested in said amended complaint would be unwarranted by any law of the United States; that such an order would constitute an unfairness with respondent's liberty of contract and would amount to the taking of respondent's property without due process of law contrary to the fifth amendment of the constitution of the United States."

Waste a Basic National Problem

Secretary Hoover Says Its Elimination Will Solve Economic Distortion—Eulogizes Engineers at Meeting of Engineering Council

ELIMINATION of the waste now causing billions of loss annually was characterized by Secretary of Commerce Herbert Hoover at a dinner given in his honor at the University Club in Washington, Jan. 5, by the American Engineering Council of the Federated American Engineering Societies, as the most fundamental of all problems with which the nation must deal. The dinner in honor of Mr. Hoover was a leading event of the first annual meeting of the American Engineering Council of the Federated American Engineering Societies held at the Cosmos Club, Washington, Jan. 5 and 6.

Great distortion between the cost of commodities to the consumer and the producer exists, Mr. Hoover said, and unless this distortion, which is bearing heavily on the consumer, can be overcome the American farmer will be reduced to the status of a European peasant. The way to a solution for the country, he added, was in the direction pointed by the recently completed findings of the American Engineering Council's committee on the elimination of waste in industry.

As a result of the investigation of the engineers there had been enormous expansion throughout the country, he said, of the consideration of fundamental questions of industrial waste, adding that the standards of living of the American people were being inquired into as never before. Mr. Hoover eulogized the engineering council as a new and powerful force in the life of the nation, saying that it had won confidence as an agency of national and State co-operation which was without the slightest selfish motive and through the efforts of which no man could profit save as a citizen in common with all other citizens. "The organization of the Council," he said, "marked the evolution of the 200,000 engineers of America into public affairs as a mighty instrument possessing rare knowledge of both material and intangible values." He regards it as the duty of the Government to take up some of the problems outlined by the American Engineering Council, and the Department of Commerce had established agencies to this purpose.

Taking 100 as the basis of the cost in 1913 to the producer and consumer, Mr. Hoover pointed out that to-day the cost to the producer could be regarded as 100 while the cost to the consumer has risen to 150 and even 170. Only through the elimination of waste, he declared, can the existing inequalities be wiped out. Taxation, State and federal, has greatly increased the distortion, he said. These conditions he held were not now due to swollen profits, but to the existence of avoidable waste. Economies of manufacture, transportation, distribution and other agencies must be sought. Idle men, he declared, was one of the greatest causes of waste.

One of the biggest problems confronting the country, Mr. Hoover thought, was that of electrification, and suggested that the engineers tackle this problem in the form of a waste survey. Such a survey, he said, afforded at this time the great possibilities in the direction of effective leadership in the elimination of waste.

More than 100 members of the council and their guests attended the dinner at which Mortimer E. Cooley, dean of engineering at the University of Michigan and president of the council, presided. The council presented to Mr. Hoover a copy of a resolution passed by it in which he was extolled for "the distinguished success which has followed him in his past services to his profession, his country and mankind."

The resolution expressed the gratitude of the organized engineers of the nation over the service of Mr. Hoover in helping to organize the council, of which he

was the first president, and recorded appreciation of "the rare judgment and vision with which Mr. Hoover has directed the initial policies of the council."

B. Stefanek, minister from the Republic of Czechoslovakia, paid tribute to the American engineers for their investigation of industrial waste. The report, he said, had been translated by his government and would be widely circulated in Czechoslovakia.

Council to Continue Support of Lampert Bill

Matters taken up at the meeting included the question: Does the council approve or disapprove of the principle of licensing or registering engineers? There was long discussion on this and it was finally decided to direct the appointment of a committee to make a thorough study of the question, embracing conditions nationally. The committee is expected to report at the next meeting of the executive board.

The council voted to continue support of the legislation for the relief of the United States patent office as embodied in the Lampert bill. The report of the council's patent committee, headed by Edwin J. Prindle of New York described conditions in the patent office as alarming. It was brought out that floor leader Mondell of the House opposed the bill on the ground that it carried salaries higher than those for similar service in other departments of the Government, and that the bill calling for a general re-classification of Government employees would take care of the situation. Mr. Prindle showed from the *Official Register* of the Government that there were many Government positions involving legal or technical knowledge which carried salaries above those asked for the patent office examiners and demonstrated that the examining force would be disintegrated if it were delayed until the re-classification bill were passed. The president was authorized to confer with Mr. Prindle and to appoint, if thought advisable, a special committee to co-operate in carrying on the patent office campaign.

The committee on engineering education did not report because "the subject of engineering education is being discussed by many competent agencies and the committee prefers to make a study of these activities and seeks to co-ordinate their conclusions from the standpoint of the profession at large rather than attempt to start a new discussion."

Co-operation in the movement to prepare for cyclical industrial depressions and unemployment by resort to public works projects was voted by the council. On this subject the council received a proposal from Mr. Hoover and it was decided to confer with him as to what way the council could best provide effective aid.

Topographic mapping and the establishment of a department of public works were other legislative matters in which the council decided to continue its support.

The expectation of matters of importance to come before the committee an early date was indicated by the chairman of the military affairs committee, Col. W. B. Parsons, New York. Lieut.-Col. John P. Hogan, New York, was appointed secretary of that committee, to fill the vacancy caused by the death of Colonel Snyder.

The work of the committee on employment, which was working on plans for a paid employment service, has been delayed owing to the illness of Morris L. Cooke of Philadelphia, chairman.

Reports of officers were approved. President Cooley in opening the sessions outlined his plans for more effective organization to be carried out in co-operation with the executive Secretary L. W. Wallace. President

Cooley plans to start soon on a tour of the South and Southwest, one of the biggest meetings he is to address being in St. Louis Jan. 18. He will speak to the Indiana Engineering Society at its annual meeting on Jan. 20. Mr. Wallace has also mapped out a traveling schedule to further the work of organization.

Membership Increases During Year

The Engineers Club of Columbus, Ohio, was admitted to membership. There are more than 20 active prospective members, according to the report of the executive secretary. The report showed that at the close of 1921 there were 8 national and 20 state and local societies, which for the year was a gain of eight member societies representing 1414 member engineers.

Considerable discussion was provoked by a plan proposed to establish a federation journal. It was agreed that some such contact should be established with the enrolled membership but there was sharp diversity as to its form. No definite action was taken. The council made provision for a continuance of its national publicity work under the direction of James T. Grady, director of the department of public information, Columbia University, New York. The results of the publicity work during the past year were described as most gratifying.

Officers

Dexter S. Kimball, dean of the college of engineering, Cornell University and J. Parke Channing of New York, were re-elected vice-presidents. W. W. Varney, New York, was again chosen treasurer, and by unanimous action of the executive board, L. W. Wallace was re-elected executive secretary.

New representatives on the council were announced as follows: *American Society of Mechanical Engineers*,

Francis Blossom, Charles A. Booth, Gano Dunn, H. H. Esselstyn, W. S. Lee, I. E. Moulthrop, John H. Stevens, A. E. Walden; *Society of Industrial Engineers*, Prof. Joseph W. Roe; *American Institute of Mining and Metallurgical Engineers*, C. H. MacDowell (succeeding Professor Richards); *Louisiana Engineering Society*, Prof. Donald Derickson; *Iowa Engineering Society*, Lloyd B. Canfield; *Duluth Engineers Club*, W. H. Hoyt; *Milwaukee Engineering Society*, Albert Blatz, Jr.

The executive board of the council for 1922 is made up as follows: H. E. Howe, Washington, *American Institute of Chemical Engineers*; Prof. C. F. Scott, of Yale University; L. B. Stilwell and Calvert Townley, New York, J. H. Finney, Washington, William McClellan, Philadelphia and L. F. Morehouse, New York, representing the *American Institute of Electrical Engineers*; J. Parke Channing and A. S. Dwight of New York, Charles H. MacDowell, Chicago, and Philip N. Moore, St. Louis, the *American Institute of Mining and Metallurgical Engineers*; L. P. Alford, New York, E. S. Carman, Cleveland, Dean D. S. Kimball, Cornell University, Prof. A. M. Greene, Jr., Troy, Dean Perley, F. Walker, University of Kansas, W. S. Lee, New York, Dean M. E. Cooley, Michigan, *American Society of Mechanical Engineers*; Prof. Joseph W. Roe, New York, *Society of Industrial Engineers*; Morris L. Cooke, Philadelphia, W. W. Varney, Baltimore, *Taylor Society*; W. E. Rolfe, *Associated Engineering Societies of St. Louis*.

The regional directors chosen for 1922 are: District No. 1, W. B. Powell, St. Louis; District No. 2, Gardner S. Williams, Ann Arbor, Mich.; District No. 4, W. J. Fisher, York, Pa.; District No. 5, Paul Wright, Birmingham; District No. 6, Lloyd B. Smith, Topeka, Kan.; District No. 7, O. H. Koch, Dallas, Tex.

BRITISH FOREIGN TRADE

Steel Exports Still Expanding in November—Imports Declining

British steel exports in November continued the upward swing recorded in September and October, according to the official data, just made public. The total was 202,059 gross tons, excluding iron ore and including scrap, which is equal to the combined exports of August and September. The October exports were 161,683 tons. Compared with November a year ago, the outgo was close to what it was then at 238,896 tons. The total for the 11 months this year stands at 1,527,302 tons against 3,107,521 tons to Dec. 1, 1920.

Iron and steel imports in November were about the same as in October. The total, excluding ore and including scrap, was 184,064 gross tons, which compares with 158,940 tons in November, 1920, and with an average per month in 1913 of 195,264 tons. The following table shows comparative data:

British Steel Exports and Imports, Gross Tons

	Exports	Imports
Average per month first quarter, 1921...	183,373	186,040
Average per month second quarter, 1921...	109,670	96,320
Average per month third quarter, 1921...	93,804	160,727
October, 1921.....	161,683	189,536
November, 1921.....	202,059	184,064
Average per month, 1919.....	188,519	70,801
Average per month, 1920.....	274,881	128,685
Average per month, 1913.....	420,767	195,264

The trend of some of the principal exports is shown by the following data:

Principal British Exports, Gross Tons

	Average per Month		November	
	1913	1920	1920	1921
Pig iron.....	78,771	38,505	10,579	10,028
Steel rails.....	41,676	11,213	12,549	25,850
Steel plates.....	11,162	16,571	13,931	5,601
Galvanized sheets.....	63,506	34,244	22,046	40,709
Steel bars.....	20,921	30,322	25,221	11,409
Tin plates.....	41,308	29,418	29,978	27,061
Black plates.....	5,679	3,026	1,830	1,780
Steel sheets.....			9,637	6,150

Exports of steel rails have shown the most marked recovery in the above products, with galvanized sheets and tin plates next.

Imports of pig iron in November were 99,279 tons, bringing the total for the 11 months to 620,705 tons,

compared with only 179,927 tons to Dec. 1, 1920. The present rate of imports is the heaviest on record.

Iron ore imports in November were only 176,998 tons, as compared with 541,742 tons per month in 1920. In November, 1920, they were 350,714 tons. The total for the first 11 months of 1921 was 1,742,905 tons, as compared with 5,972,283 tons for the first 11 months of 1920.

Manganese ore imports were only 6174 tons in November, which makes the total to Dec. 1, last year, 165,935 tons against 405,268 tons to Dec. 1, 1920.

Independent Merger Negotiations

CHICAGO, Jan. 9.—Executives of three steel companies which have been mentioned in connection with a proposed merger met in Chicago this week and another meeting will be held in New York in the near future. Negotiations are believed to be at an advanced stage. Whether eventually a consolidation will be effected taking in the four other companies that have been mentioned in that connection may not be determined for some time, but at present, indications are favorable to a union of at least the Inland Steel Co., the Steel & Tube Co. of America and the Youngstown Sheet & Tube Co. The possibility of including a fourth company with these three has also been canvassed.

Great Southern Steel Corporation Plans

BIRMINGHAM, ALA., Jan. 9.—Great Southern Steel Corporation, which was recently organized by Chicago interests and chartered at Dover, Del., with capital stock of \$105,000,000, has taken out a charter in Alabama under capital of \$500,000 and with the announced intention of locating a steel products plant in the Birmingham district. Local mineralogists, who helped the concern to buy 100,000 acres of coal and ore land in several counties, say the new plant is to make a steel product not heretofore manufactured here. Details as to site and like have not been given. The company at present has no operating properties in Alabama.

INTERSTATE TUNNEL

Bids for Vehicular Passageway Will Be Opened Feb. 7—Iron and Steel Tonnages

Tenders for the construction of the New York-New Jersey vehicular tunnel, extending from Canal and Spring streets, New York, to Twelfth and Fourteenth streets, Jersey City, N. J., have been issued by the Bridge and Tunnel Commission, Room 614, Hall of Records, New York. Bids will be opened Feb. 7. The contract for the tunnel calls for 13,512 ft. of tunnel, constructed with cast iron segments, 29 ft. 6 in. outside diameter, with a short section, 30 ft. 4 in. in diameter and 2816 ft. of cut and covered subway at the approaches, making a total length of 18,474 ft. of construction. Entrances and exits at both the New Jersey and New York ends of the tunnel will be about two blocks distant. The contract is divided into two parts; specifications 3 and 4. The former calls for construction of the tunnel from the New York side to about the end of the rock ledge in the Hudson River and includes about 30 per cent of the iron and steel that will be used. The latter calls for the building of the river section of the tunnel and the construction on the Jersey City side, involving about 70 per cent of the total iron and steel that will go into the completed tunnel. The present contracts include all but a few hundred yards of covered subway construction at the approaches on each end.

The largest item of material involved is the tonnage of cast iron segments for the lining, 33,200 tons for specification No. 3 and 72,300 tons for specification No. 4, a total of 105,500 tons. The total iron and steel involved on both specifications is as follows: Structural steel, miscellaneous, 90 tons; structural steel for river shaft caissons, 4460 tons; steel beams and shapes, 184 tons; steel rods and bars for reinforcing, 547 tons; wire mesh, 222 tons; special rolled floor beams (about 100 lb. per ft.), 2490 tons; built up floor beams, 245

tons; steel work connecting caissons, 146 tons; steel in permanent tie rod anchorages, 1330 tons; high tensile steel tunnel bolts and nuts, 4615 tons; permanent tie rods (bolts, nuts, pins and clevises), 332 tons; copper steel plates, bolts, nuts and washers, 238 tons; ladders, hand bars and miscellaneous wrought iron fixtures, $\frac{3}{4}$ ton; wrought iron and steel pipe from .1 to 3 in., about $1\frac{1}{2}$ miles; cast steel lining, 9050 tons; cast steel pile segments, 370 tons; cast iron hub and spigot pipe, 117 tons; manholes and catch basins, 35 tons; non-corrosive alloy metal, about 7 tons; water pipe, 6-in. 13,700 ft., 8-in. 50 ft., 10-in. 1770 ft., 12-in. 10 ft.; bronze bolts, wedges and hinges, about $1\frac{1}{2}$ tons.

The time allotted for completion of the contract is three years from date of the award. At present between 75 and 80 construction and iron and steel companies and foundries have obtained specifications from the commission.

Among the iron and steel companies, foundries, machine shops and shipbuilding companies which will probably submit bids are: United Engineering & Foundry Co.; Eastern Malleable Iron Co.; Wheeling Mold & Foundry Co.; New York Car Wheel Co.; Lake Erie Bolt & Nut Co.; Midvale Steel & Ordnance Co.; Federal Shipbuilding Co.; American Steel Foundries; American Brake Shoe & Foundry Co.; Bethlehem Steel Co.; American Bridge Co.; T. A. Gillespie Pipe Co.; Central Foundry Co.; Woodward Machine Co.; McClintic-Marshall Co.; New York Shipbuilding Co.; Hooven-Owens-Rentschler Co.; United States Cast Iron Pipe & Foundry Co.; Ingersoll-Rand Co.; Chicago Pneumatic Tool Co.; Pittsburgh Screw & Bolt Co.; National Malleable Castings Co.; Lynchburg Foundry Co.; Moline Plow Co.; Diamond Machine Co.; Buffalo Foundry & Machine Co.; Birmingham Iron Foundry, Derby, Conn.; Phoenix Iron Works; Lobdell Car Wheel Co.; Topping Bros.; Sun Shipbuilding Co.; Manning, Maxwell & Moore; Howard Iron Works; Morse Dry Dock & Repair Co.; Hubbard Steel Foundry, East Chicago, Ind.; Westinghouse Electric & Mfg. Co., and the General Electric Co.

Secretary Hoover Holds Conference on Railroad Problems

WASHINGTON, Jan. 10.—Deep interest is manifested in a meeting which was held here last Saturday evening at the home of Secretary of Commerce Herbert Hoover with railroad executives and members of the four railroad brotherhoods, and possibly others.

Replying to a question as to whether the Administration had been requested by the brotherhoods to enlist itself on their behalf in favor of National agreements, a statement was made at the White House to-day that the conference was called to avoid conflicts in connection with the transportation situation. It was neither admitted nor denied that the question of National agreements was taken up, but it was stated that further conferences will be held between Government representatives with railroad executives and brotherhood men. It is understood that the Administration is concerned over the transportation rate and labor situation and is endeavoring to eliminate difficulties prevailing and threatened and to bring about stimulation of industrial activity dependent upon the existing railroad and labor problems.

The railroads, it is claimed, had no part whatever in calling the conference and what their attitude was toward questions discussed is not known. In the absence of definite information shippers have expressed apprehension lest the railroad brotherhoods are trying to compel the adoption of some agreement as to wages, working rules, etc., that would make it impossible for the railroads to further reduce rates, so urgently insisted upon by shippers as a whole. It is considered significant that the meeting was asked for by them at a time when the Interstate Commerce Commission is engaged in its general rate investigation and before it has had time to close and pass upon the case. The opinion has been expressed that the brotherhoods may be trying to have a policy determined, advantageous to themselves,

which would make it impossible for the railroads to reduce rates further and that it has sought to do this before the investigation is closed, so that the commission would have to act adversely upon requests for reduced rates.

Unemployment in Pennsylvania

The number of unemployed in Pennsylvania increased more than 50,000 in December, according to the semi-monthly report of the State Department of Labor and Industry, covering the situation as of Jan. 1. The new year starts with 321,893, men and women, registered for work at the several district offices of the department. The Pittsburgh district office is the only one of 10 which reports no increase in unemployment, and this is explained largely by the fact that no consideration was given the number at present idle as a result of the holiday suspension of steel plant operations, which is regarded as only temporary. The report by districts follows: Altoona, 15,460; Erie, 16,700; Harrisburg, 10,393; Johnstown, 17,765; McKeesport, 4300; New Kensington, 6200; Philadelphia, men, 138,000; women, 12,400; Pittsburgh, 51,400; Scranton, 42,900; Williamsport, 6375.

Charles S. Robinson, vice-president and general manager of the Youngstown Sheet & Tube Co., was re-elected president of the Engineers' Club in the Youngstown district Dec. 29, while W. C. Coryell was re-elected vice-president. G. T. Seeley, Stanley H. McKee and F. B. Thomson were chosen directors for two years, and Charles B. Cushwa, J. W. Deetrick and G. W. Knotts were elected trustees for two years. Officers will be installed at the next general meeting, Jan. 26, when Arthur G. McKee, consulting engineer of Cleveland, will address the members on "The Modern Blast Furnace."

JONES & LAUGHLIN PLANS

Pittsburgh Company Acquires Large Tract in the Chicago District

CHICAGO, Jan. 9.—The Jones & Laughlin Steel Co., Pittsburgh, has entered into a contract with the East Chicago Co. and the Newport Co. to purchase from them 900 acres on the north side of Hammond, Ind., lying on both sides of the west branch of the Indiana Harbor Canal. The price to be paid in the event that certain requirements are complied with by the sellers is \$1,450,000, or \$1,611 an acre, and the funds are now on deposit at the First Trust & Savings Bank at Chicago. The plans of the company are of an elaborate character. Blast furnaces and mills to cost between \$25,000,000 and \$50,000,000 are planned, and employment will be provided for over 7000 people. The importance of the undertaking may be grasped when it is realized that the site of 900 acres is larger than those of the Inland Steel Co. and the Steel & Tube Co. of America combined.

The passing of the Pittsburgh basing point in prices of plates, shapes and bars during the recent period of business depression, and the possibility that this method

of quoting prices will be permanently abandoned as a result of the case now before the Federal Trade Commission, probably account for the desire of the Jones & Laughlin company to have a Western plant. In Chicago circles it is felt that hundreds of other industrial companies which have heretofore served their Western customers from Eastern plants will follow the example of the Jones & Laughlin company and establish Western branches.

Confirmed at Pittsburgh

PITTSBURGH, Jan. 10.—Reports from Chicago that the Jones & Laughlin Steel Co. was negotiating for approximately 900 acres of land on the north side of Hammond, Ind., lying on both sides of the west branch of the Indiana Harbor Canal, are confirmed by officials of the company and successful termination of the deal is expected. It also is admitted that the land is for a new steel works, but it is not expected construction work will be started soon unless there is an early decision by the Federal Trade Commission in the Pittsburgh basing point case and this decision favors the complainants. The plant site gives the Jones & Laughlin Steel Co. an anchor to windward in the event Pittsburgh does not remain the sole basing point of steel prices.

JAPAN ACTIVE

Rail and Pipe Contracts Awarded—Black Sheets Less Active—Other Markets Suggest Barter

NEW YORK, Jan. 10.—The export situation is similar in every respect to the prevailing conditions during the last few months of last year. But little activity is noted from any part of the world except the Far East and buying from these markets is confined almost entirely to Japan. The activity evident in many countries in developing hydro-electric, railroad and other projects may lead to some buying later in the year. The six pipe lines of 48-in. to 52-in. steel pipe for the Taiwan Electric Power Co., which will be installed on the Island of Formosa in connection with a project for hydro-electric power, have been awarded to Mitsui & Co., and it is expected the fabrication will be done by M. W. Kellogg & Co., Jersey City, N. J. The order totals about 2700 tons. The electric equipment is understood to have been placed but the 125 miles of steel transmission towers is still pending. These will probably be fabricated in Japanese shops if the precedent established in past purchases is pursued.

The 13,000 tons of 60-lb. and 75-lb. rails for the Imperial Government Railways were also placed with Mitsui & Co., and will be rolled by the Steel Corporation. This award is reported to have been made on a price c.i.f. Japanese port of between \$46 and \$47 per ton. Other railroad equipment purchases from the Far East include fittings for about 50 passenger coaches of the South Manchuria Railway Co., for which steam heating equipment and window frames were purchased through a Japanese export house. This export house has also booked an order for 18 steam boilers and radiators with 25,000 sq. ft. of radiation. The Japanese Government is reported to be in the market for a total of about 8000 tons of structural material for two bridges.

Sheet buying from Japan shows a slight decline from its previous activity and is not expected to revive to its former proportions until late spring. Slightly more interest is now being shown in sheets of heavier gage than Nos. 30 and 31½, which have been in particular demand.

Chinese activity is confined largely to inquiring for various kinds of material in small lots. One large inquiry now in the hands of a New York exporter calls for 3000 kegs of checkered head wire nails, about 10,000 boxes of light tin plate and about 200 tons of No. 31 gage galvanized sheets.

In addition to the fabricated pipe purchased for Formosa, about two miles of 33-in. steel pipe is reported

to have been placed in the United States by a London exporter and there is an inquiry from the Philippines for about 12,000 tons of 33-in. cast iron pipe. A hydro-electric company has been formed in Chile, according to the Bureau of Foreign and Domestic Commerce. The new organization is a combination of two established companies and will operate as the Chilena de Electricidad. A new hydro-electric station of 50,000 hp. is contemplated and increase from 18,000 hp. to 28,000 hp. in another station is intended. The inquiry of the Argentine Government for several hundred tons of galvanized sheets has been revived, but the terms required of sellers are extremely severe and but little interest is being shown.

Inquiry was recently made in the American market by an Australian company for 1285 tons of barbed wire. Australian buyers often suggest transacting business on a basis of barter, because of their difficulties in marketing their products. These suggestions are not peculiar to Australian business. The Usines Metallurgiques de la Basse-Loire, 25 Rue de Clichy, Paris, recently suggested the bartering of French iron ore for American coal. This company, which claims to consume about 250,000 tons of coal a year, has ore deposits at Segre near Nantes, France.

High Rates in Cast Iron Pipe

WASHINGTON, Jan. 10.—The Interstate Commerce Commission has held to be justified the proposal of railroads to cancel the existing basis for applying rates on cast iron pipe and connections from the Birmingham, Ala., district to Montana points, and also the restoring of the old basis of the combination on St. Louis. This decision is in accordance with a previous one restoring the same basis of rate making to the Southwest. The return to this basis will have the effect of increasing rates on cast iron pipe and connections from 40c. to \$1.20 per ton.

The different rate increases during the past two years threw the rate structure out of line and the joint through rates became less than the combinations on St. Louis, Omaha and St. Paul, and placed some of the carriers at a disadvantage, it was claimed, in comparison with competitors for business through the three gateways of the Northwest.

There was partial resumption at the plant of the Pittsburgh Steel Co., Monaca, Pa., Jan. 4, after a complete shutdown on Dec. 24. No. 1 rod mill, No. 2 wire mill, part of the galvanizing department and a number of nail machines were started.

Indices of Business Activity

There has been a rapid increase of late in the available amount of statistical matter relating to the volume and character of commercial activity. There are the various classes of statistics that long have been in use, there are the presentations made in recent years by the Federal Reserve Board, and there are the ambitiously conceived compilations of the Department of Commerce as recently organized by Secretary Hoover.

Those who wish to study business in detail can be at no loss for material. The price movements of practically all important commodities are known, and in most cases the production also. When it comes to generalizing, however, the course is not so clear, nor can it be expected to be clear. What is called "business" has extremely intricate ramifications, and the statistics cannot be less complicated than the movements of which they are the numerical picture.

It is a habit of many men to take some particular movement and follow it as being typical of "business" in general. Bank clearings make a favorite reference, as do the monthly blast furnace reports of THE IRON AGE and the unfilled tonnage of the United States Steel Corporation. Railroad earnings used to be a favorite, but unfortunately they disappeared.

Only a slight reference to the statistics of 1921 is sufficient to show the necessity for generalizing, if one wishes to obtain an idea as to how business stands, and to show at the same time the extreme difficulty of generalizing from the particulars. Three citations may be made of statistics which, off-hand, one might think ought to be typical of business in general. Debits to individual accounts at banks, freight ton-mileage on the railroads and the production of steel ingots.

Comparing 1920 and 1921, and taking 1920 as 100, the year 1921 stands between 80 and 85 in bank debits, at 75 in freight ton-mileage, on the basis of the first nine months of each year, while steel ingot production is about 48.

Here is certainly no coherence. Allowing for the decreases in commodity prices, salaries and wages, the bank debits indicate that the volume

of business, in commodities transferred and service rendered, increased from 1920 to 1921. Allowing some weight to the claims that high freight rates have not interfered greatly with the movement of valuable commodities, but have handicapped seriously the movement of heavy and cheap materials, the freight movement on the railroads, in point of value, can hardly have decreased much. The production of steel, on the other hand, dropped off by more than one-half in tonnage, while the value decreased much more.

Other divergences would be shown if we should take into the reckoning such matters as coal production, retail store trade, building permits, unemployment, postoffice receipts and the like. In conversation men often refer to "the state of general business," but it becomes evident that there is no such thing as "general business." Some lines of business appear to have been very poor in 1921 as compared with 1920, but the idea that may have been prevalent at one time that practically all business was "good" in 1920 is not tenable. Each line of business has a case of its own. There are relationships, but frequently they are far from close. There is no easy path to a conclusion as to the state of trade in general. One must study the trade movements in detail, and with particular reference to the individual problem which he wishes to solve.

The upward swing in British steel exports which began in September has continued. November had the surprising total of 202,059 gross tons, which is second to the largest movement of the year, 233,114 tons in January. While November fell below the 1920 monthly average by about 70,000 tons, it did better than the 1919 average of 188,519 tons per month and came about halfway up to the 1918 rate. It is significant that British exports were close to 80,000 tons larger than those from the United States in November. It was natural that after the long embargo caused by the coal strike, the British steel industry should show some rebound due to shipments on old contracts, but in view of the high costs of

British manufacturers the extent of the recent export movement in competition with continental countries of lower exchange is noteworthy.

Labor Efficiency—Some Comparisons

Viscount Haldane said recently: "I have no fear of British manufacturers and British workmen, if they will give themselves a chance. I think they are the best in the world." In contrast with this, an article in a London industrial publication in November said: "A quarter million men employed by the United States Steel Corporation produce 50 per cent more steel and steel products than the half million men employed by England's steel companies produce. Half a million American miners produce 10,000,000 tons of coal per week; it takes nearly 1,250,000 British miners to get 4,500,000 tons per week."

In furtherance of the latter statement, a recent issue of the *South African Mining and Engineering Journal*, showing a picture of a gathering of English miners being harangued by an agitator, has in the caption: "This is the sort of ill-reasoned action that has played havoc with the British coal industry, and has reduced her output per man to less than a third of what it is in the United States." Figures from the same publication place the coal output per underground employee in the United States at 4.40 tons per day employed, as compared with 1.19 tons in Great Britain.

Not all of this difference can be explained upon the score of individual working efficiency. It must be remembered that American use of machinery and power is greater than is to be found anywhere else in the world, not only in coal mines and steel mills, but in most other industrial processes. Shipbuilding plants in the United States are equipped with an outfit of cranes and other weight-handling appliances far in advance of those used in any except the best of British plants. High wages have forced us to use much machinery. Hence, a very considerable increase in production per man is inevitable, even with no gain in individual productive efficiency.

When all allowances are made, however, for all mechanical aids to greater production, the fact remains that American workmen, on the average, where their work has not been corroded by interference on the part of walking delegates, have consistently produced more per working day and per working hour than can be shown in other countries. They have received a larger wage and they have earned it.

Reference to the railroad problem brings to mind again the fact that the present rates and wages are beyond the capacity of industry to carry. At the same time it must not be forgotten that even the present swollen freight rates are far lower than the freight rates in any other country, and that in spite of our very great operating costs, brought about in large measure by swollen wage scales. During the first half of 1921 the average freight rate per ton-mile in the United States was 1.278c. This is to be compared with 3.5c. per ton-mile in England during the same period.

It must not be inferred that the above is an expression of satisfaction with present returns from labor. Nothing can be further from the truth; for labor, notably in railroad, building and mining, is giving a much smaller return for the wage received than we have every right to expect. It will be evident, however, that our position in this matter is better than that of other nations with which we are competing for the markets of the world (apart from longer hauls on raw materials, in some cases, and longer hauls to seaboard), and those who have been decrying our ability to hold a reasonable amount of our foreign trade have apparently left out of the account some of the relationships mentioned above.

Cost of Employing Steel

It has been a matter of common remark, and critical remark, that in the decline in commodity prices that began in 1920 prices of manufacturers took the lead in falling, wholesale prices following and retail prices coming far in the rear. Somewhat the same alignment is observed in prices of pig iron, steel and wares made from steel.

While the percentage relations between pig iron, semi-finished steel and the regular rolled products of the mills are much the same as before the war, the influence of the great advance in freight rates, which falls chiefly upon pig iron on account of the large tonnage of raw material that must be assembled, should cause pig iron to show a greater percentage spread above pre-war prices than is shown by finished steel. This is not the case. Relative to cost of manufacture, pig iron is now cheaper than finished steel.

Comparisons of prices now being received by the steel mills for their regular products, such as bars, plates, sheets, etc., with the prices of various things that are made from steel show in the great majority of cases that the finished wares are much farther above pre-war prices than are the steel mill products. Of course there are exceptions, but the average is as indicated. The steel wares that are sold at retail to the ultimate consumer, such as machinists' and carpenters' tools, show the greatest excess.

When cost is the controlling element in determining the volume of consumption, and in the last analysis it usually is, it is the price to the eventual consumer or user that governs, not the price of intermediate materials or the wholesale prices of the finished wares. The obliqueness of view of those who last spring were clamoring that the steel mills should reduce their prices to stimulate business has been fully indicated by subsequent events. Steel prices have been liquidated in a drastic way, yet ultimate consumption has not increased greatly. The ultimate consumer, whether the householder, the artisan or the investor, is not getting the full benefit of the declines that have occurred in what is called "the steel market."

The explanation both for the divergence between manufacturers' prices and retailers' prices

for commodities in general and for the divergence between steel prices and prices of wares made from steel is probably that competition has been more effective at some points than at others. The wholesalers who buy from manufacturers and the retailers who buy from wholesalers are discriminating and induce price competition. The general public, which buys at the drygoods store or the corner grocery, is not so discriminating, the result being that there is less competition in retail trade. In steel, the competition between steel mills in the past six months has been very keen. The competition between those who work up steel into various products has not been so keen. In a sort of way it is a case of what is everybody's business being nobody's business. This is, by the way, the precise thing that afflicts the building trades generally, for in the case of the man wishing to spend money for the erection of a garage, a dwelling house or other structure there is a different individual each time.

The cost of steel in its ultimate use is at a much higher percentage above its pre-war level than is the case with steel mill products, and in that lies one of the obstacles to a great broadening in the use of steel. The relatively low prices of rolled steel may, and probably will, cause buyers to stock up in a moderate way, but that will only temporarily swell the volume of demand upon the mills. What is needed is a lower cost in employing steel in its final form.

Electrolytic Iron

A new and important advance in electrometallurgy is represented by the announcement of a new commercial process for making electrolytic iron from an ore. Electrolytic copper has been a development of only recent years and now has the leading place in that market. Electrolytic tin and zinc are more recent commercial products, already factors in their respective markets. What place will electrolytic iron take in the field that is now occupied by product coming chiefly by the route of the blast furnace, steel works or puddling furnace and rolling mill?

The details of the Eustis process for the manufacture of electrolytic iron tubes and other products were the subject of an illuminating article in THE IRON AGE last week. One vital feature distinguishes this American process from the French and older methods. It is the use of an ore instead of scrap iron as an anode. In the new process pyrrhotite, or a high sulphur iron pyrite, largely FeS_2 , is the basis of a cyclical chemical process which furnishes ferrous chloride in constant and ample quantity as an electrolyte. This ore not only exists in the United States and Canada in millions of tons but is practically valueless for iron smelting or for sulphuric acid manufacture. It is possible to burn out only a small percentage of the sulphur. The Eustis process therefore has to its advantage a cheap raw material, the production of copper and sulphur as by-products, and an electrolyte purer than that usually obtainable from iron scrap.

The fields of usefulness for this pure iron—an iron of greater purity than has been attainable by any other process—are outlined by Mr. Stoughton. The application of its striking physical properties to other products than tubes opens up not a few possibilities. The principal drawback is the cost of electricity. This has been largely overcome in the case of electric steel and other commercial applications of the electric current. The elimination of costly smelting and complicated refining processes and the simultaneous recovery of by-products are marked advantages of the American electrolytic process. It is to be noted also that "it is unique in metallurgy for one brief cycle of operations to deliver in marketable form more than 90 per cent of any ore."

Splitting Furnace Shafts

Investigations of swelling and cracked blast furnace shafts have indicated that zinc in the iron ore and possibly in the limestone, even when existing in small amounts, has a cumulative effect that is not to be overlooked. The distortion of the steel plates, with splitting either vertically or horizontally as the final effect of the stresses set up, has commonly been charged to the refractories. At first there was a disposition to claim that the action resulted from inferior brick work, due in part to the lowered efficiency if not indifference of the brick makers; and then the phenomena were seized on by the advocates of hand and machine-pressed bricks, each trying to prove that the product of the other was inferior. The fact that the expansive force in the refractory lining might be explained by the presence of the zinc was not allowed to weaken either case. One or the other type of brick was simply condemned as being more easily permeable by the zinc. Thus disintegration might occur, requiring relatively early relining, or the material allowed impregnation though remaining in firm masses against which the expansion of the zinc could force the outward bulging of the steel shell.

Now, the view is taken that the condition of the brick work is a secondary matter and that the situation naturally results from the inability of the blast furnace easily to rid itself of zinc once introduced. It appears that zinc troubles have been met with in long runs with ores lean as regards zinc and that they are likely to be frequent and pronounced where the furnace burden has high percentages of zinc.

It has been explained that the zinc oxide in the downward passage in the furnace is reduced in the fusion zone and the metallic zinc in vapor form passes upward with the gases, largely to be carried outside of the furnace. A portion is caught in the upper strata of the stock and may be oxidized again by the furnace gases. This zinc oxide then descends and the process is repeated. Meanwhile some of the zinc is deposited on the brick work, impregnating it and the joints in both the metallic and the oxide form. The action is accentuated in regions of the shaft cooled on the outside. The fact that metallic zinc has a linear

co-efficient of expansion fully five or six times that of the brick lining (with some claims of a much higher expansion ratio) is advanced to explain pressures great enough to tear the steel work. The condition is an argument for the thick rather than the thin shell, which a few years ago had some vogue, and it explains the steel banding of shells provided usually after indications of swelling.

Pending a definite contribution to the literature on the subject, it behooves the furnace operator to watch the zinc content of his burden, particularly if, as under present commercial conditions, he expects repeated bankings, with all that the cooling down may do in favoring zinc accumulations.

Plant Purchased by Canton Forge & Axle Co.

The Canton Forge & Axle Co. has purchased the drop forge plant of the Standard Parts Co. at Canton, Ohio. This plant is equipped with modern forging and heat treating equipment, including drop hammers of sizes running up to 12,000 lb. and upsetting machinery. Heretofore the product has been entirely absorbed by the Standard Parts Co. in the manufacture of axles and other drop forgings going into automobiles.

The new corporation will still be the source of supply for Standard Parts Co. forgings. In addition the new management will enter the market for all kinds of general commercial drop forge work.

The officers of the Canton Forge & Axle Co. are: F. A. Poor, chairman of board; F. C. Moore, president; H. C. Holloway, secretary; Thomas F. DuPuy, general manager.

Increased Capacity in Operation at Youngstown

YOUNGSTOWN, OHIO, Jan. 10.—Steel plant operations in the Mahoning Valley are on a moderately broadening scale. Forty-five of the Valley's 113 sheet mills are under power, 12 of 17 pipe furnaces are fired, while 28 of 51 independent open-hearth furnaces are charged. Sheet mill production compares with a recent low of 20 per cent.

The Youngstown Sheet & Tube Co. has reduced the number of its active sheet mills from 15 to eight, while the Brier Hill Steel Co. is operating but 10 of 28 such units. The Republic Iron & Steel Co. has four of 18 sheet mills active, Falcon Steel Co., 5, Newton Steel Co., 10, and Trumbull Steel Co. and Sharon Steel Hoop Co., four each. The plant of the Newton company had been idle two weeks for repairs.

The Carnegie Steel Co. is operating five blast furnaces, while its finishing mills are around 60 per cent.

More Building in Chicago

Building construction in Chicago made an excellent showing in 1921 despite adverse conditions. Permits were taken out for 7800 structures, extending over a frontage of 238,025 ft., and involving a total cost of \$124,028,010, as compared with 3745 buildings, 135,440 ft. of frontage, and a cost of \$79,102,650 in 1920. The record for 1921, in terms of frontage, is the best of that for any year since 1916. It falls below the years 1905 to 1916 inclusive, however, when frontage totals ranged from 243,485 ft. in 1905 to 327,496 ft. in 1916.

Confusion has arisen over the identical names of the National Engineering Co., Chicago, and the National Engineering Co., Irwin, Pa. The Chicago company is the manufacturer of foundry appliances and of the Simpson patented specialties utilized largely in foundries generally, while the Irwin concern is a manufacturer of electrical devices.

Sharp Decline in Steel Ingot Output in December

The steel ingot statistics of the American Iron and Steel Institute show that 30 companies, which in 1920 produced 84.20 per cent of the total, had an output in December of 1,427,093 gross tons, as compared with 1,660,001 tons in November and with 803,376 tons in July. The December decrease from November was 232,908 or 14.03 per cent. The increase in November over October was 2.67 per cent. Estimating the production of other companies on the basis of the 30 companies (though it is probable the small companies did not equal the rate of the larger ones) the total output of ingots in December was 1,694,885 or 67,795 tons per day.

In the table below the output of Bessemer and open-hearth works is separated and the figures for 1920 by months are included:

Monthly Production of Steel Ingots by 30 Companies Which Produced About 84.20 Per Cent of Total in 1920--Gross Tons

	Open Hearth	Bessemer	All Other	Total
January, 1920...	2,242,758	714,657	10,687	2,968,102
February	2,132,106	700,151	12,867	2,865,124
March	2,487,246	795,164	16,640	3,299,049
April	2,056,336	568,952	13,017	2,638,305
May	2,251,544	615,932	15,688	2,883,164
June	2,287,273	675,954	17,463	2,980,690
July	2,135,633	653,888	18,297	2,802,818
August	2,299,646	685,003	5,784	3,000,432
September	2,300,417	693,586	5,548	2,999,551
October	2,335,863	676,634	3,485	3,015,982
November	1,961,861	673,215	3,594	2,638,670
December	1,687,162	649,617	3,586	2,340,365
Total, 1920...	26,197,843	8,112,753	121,656	34,432,252
January, 1921...	1,591,281	608,276	3,629	2,203,186
February	1,235,863	450,818	2,796	1,749,477
March	1,175,591	392,983	2,404	1,570,978
April	1,000,053	211,755	2,150	1,213,958
May	1,047,810	216,497	1,643	1,265,950
June	808,286	193,644	1,476	1,003,406
July	689,489	113,312	575	803,376
August	915,334	221,116	1,621	1,138,071
September	908,381	265,152	1,267	1,174,740
October	1,269,946	345,837	1,028	1,616,810
November	1,294,371	363,912	1,718	1,660,001
December	1,129,174	296,380	1,539	1,427,093
Total, 1921...	13,125,578	3,679,682	21,686	16,826,946

The December ingot production was at a yearly rate of 21,084,245 tons, counting 311 operating days to the year. This compares with a rate in November of 23,581,886 tons and with 11,857,186 tons in July, the year's low point. The December decrease was due largely to reduced operations of independent steel companies.

The decrease of 232,908 tons in the ingot output of all companies reporting in December from that in November contrasts with an increase of 233,605 tons in December pig iron output over that of November.

Annual Carnegie Steel Co. Dinner

The twenty-fifth annual dinner of the executive, sales and operating officials of the Carnegie Steel Co. was held at the William Penn Hotel, Pittsburgh, Saturday evening, Jan. 7. As usual, the affair was strictly a company affair. President James A. Farrell of the Steel Corporation was present. Hugh P. Tiemann, metallurgical engineer, spoke on "Quality Requirements"; James M. Camp, salesmanship engineer, discussed "The Carnegie Steel Co. and Occupational Training"; Louis C. Bihler, traffic manager, discussed "The Present Relations of Transportation to Industry." The subject of Dr. John S. Unger, research expert, was "Future Probabilities."

The Wainwright Engineering Corporation, Connorsville, Ind., manufacturer of piston pins and pistons for automobile motors, has been merged with the McQuay-Norris Mfg. Co., St. Louis, one of the largest manufacturers of piston rings in the world. The Connorsville concern will be known as the McQuay-Norris Mfg. Co. of Indiana, Wainwright division. Harry A. Wainwright, vice-president and general manager will continue in that capacity. As a result of the merger, the volume of business by the plant is expected to increase 25 to 50 per cent.

Iron and Steel Markets

JANUARY QUIETNESS

Some Car and Rail Buying But Little Else

Steel Corporation's Preponderance in 1921

Output—Coal Strike Possibilities

Little activity was expected from the first half of January, with inventories uncompleted, and the quietness in iron and steel in the past ten days is not disappointing. Operations thus far have been slightly less than the average for December, the Steel Corporation's percentage now being 46 or 47, against 49 last month, while the independent companies are to-day about 28 per cent, after averaging 31 per cent last month.

The December steel output of 1,427,000 tons of ingots by 30 companies reporting—a falling off of 233,000 tons from November—indicates that the country produced about 19,300,000 tons of ingots in 1921.

The Steel Corporation, which operated all through last year at a higher rate than the independents, probably produced a larger percentage of the total than in 15 years. While its steel making capacity is about 45 per cent of the total, it changed places with the independents in actually turning out at least 55 per cent of the country's output in 1921. Official returns may show that it nearly equaled the 57.8 per cent which was its share in 1906.

In casting up the prospects for blast furnaces and mills, in looking toward the active season, manufacturers recognize that much hinges on the extent to which freight rates and coal mining and building labor are brought into line with the drastic deflation in steel. The possibility of a bituminous coal strike in April and the check it would put on iron and steel production are also regarded as factors of uncertainty.

Railroad demand, as for some time past, has been the principal item in the limited market news of the week. At Chicago the Union Pacific placed 4500 cars and the Illinois Central 2000. Action by the Great Northern is expected next week.

The Pennsylvania Railroad's rail order for 80,000 tons brings the total of 1922 business above 500,000 tons, but it is to be said that most of the large orders are now out. The Pennsylvania has over 45,000 tons still to come on its 1921 contract, besides having 25,000 tons in stock, so that its probable wants for the year are covered. Track supply orders are coming along with rails, indicating active spring work on track. The Louisville & Nashville is asking for 3500 tons of splice bars.

Rails and tin plate largely account for the Steel Corporation's increase of 17,872 tons in unfilled orders on Dec. 31. Its share of 375,000 base boxes of tin plate bought by the Standard Oil Co. for export was one of the large items.

In the matter of prices plate mills divide into two classes—those that will not sell below 1.50c. and those whose concessions from this figure have been \$1 to \$2 per ton on exceptional business. Some check is noted to recent contracting for oil storage tanks, and oil well pipe feels the effect of the decline in crude oil.

The automobile industry is again under way with a fair production after the holidays. The Ford schedule for January is 50,000 cars, or something over half its maximum.

Large size structural steel awards of the week will require 8000 tons of steel, while fresh projects call for 9000 tons. On foreign account 2700 tons of steel for pipe lines in Formosa has been placed in the United States and over 9000 tons of material for bridges and transmission towers, also for the Far East, is likely to come to domestic mills.

An order from Japan for 13,000 tons of rails, taken at somewhat under \$47 c.i.f., Japanese port, is conspicuous. More rails will be wanted in the Orient, but it is questioned that the 1921 record of 100,000 tons of sheets shipped from this country to Japan can be duplicated this year.

Nearly half the country's total of 2,200,000 tons of steel exports last year was a carry-over from 1920 orders. There is nothing like that to help out in 1922, yet a gradual increase in exports is expected, partly on the score of a world consumption of steel last year only about half the 75,000,000 tons of 1913.

Radiator companies again have been the principal buyers of pig iron and a considerable amount, including 5500 tons placed with a Buffalo company, has been taken. But the buying even for radiator works, which have had a good operation for months, has been conservative and represents only a small part of what has been placed in other years. Birmingham iron at \$16.50 can be sold on the Pacific Coast at a little more than \$30, or very nearly the price of Belgian iron.

Many foundries are figuring on the cast iron segments for the New Jersey and New York vehicular tunnel, which will require somewhat more than 100,000 tons. Bids will be opened Feb. 7. As the delivery of the segments will extend over nearly two years, furnaces are slow to quote on pig iron.

Pittsburgh

PITTSBURGH, Jan. 10.

The new year thus far has failed to develop any pronounced departure on the part of consumers of iron and steel from their policy of meeting only their actual requirements. Business has not developed to any extent since the holidays. This does not cause disappointment except possibly to a very few. It was pretty well understood that the taking of inventories hardly would be completed before the middle of January, and this finds some confirmation in reports that in a general way inventories are not more than 60 per cent completed. Opinions regarding 1922 business do not vary widely. In most quarters the belief is that pending freight rate and railroad labor wage revisions, the liquidation of coal prices and mine labor charges and the bringing of building trades wage rates more nearly in alignment with those in other crafts, there can be no very long sustained periods of activity, and due recognition is given the fact that these matters cannot be satisfactorily settled overnight. Some put the date of a definitely upward swing in the demand as far off as next September, while there are some who feel that it will be 1923 before there is a return to healthy trade conditions.

Composite Price, Jan. 10, 1922, Finished Steel, 2.062c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets	Jan. 3, 1922, 2.062c. Dec. 13, 1921, 2.135c. Jan. 11, 1921, 3.057c. 10-year pre-war average, 1.684c.
These products constitute 88 per cent of the United States output of finished steel.	

Composite Price, Jan. 10, 1922, Pig Iron, \$18.60 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Jan. 3, 1922, \$18.60 Dec. 13, 1921, 19.46 Jan. 11, 1921, 31.21 10-year pre-war average, 15.72
---	---

The week under review has brought no particular change in prices. Frequent intimations that less than 1.50c., Pittsburgh, has been done on plates are not disputed by producers here, but they assert that the lower prices are Pittsburgh equivalents rather than prices made by the Pittsburgh mills. The tendency of mills outside the Pittsburgh district to quote on an f.o.b. mill basis still is pronounced and unusually sales by these mills figure back to less than the prices quoted by Pittsburgh producers. On the whole, it must be said that as far as business in this district is concerned, there is more resistance to the effort to put prices down than was the case even as recently as last month.

The week likewise has been productive of little or no change in mill operations in this and nearby districts. The Pittsburgh Steel Co. has started up some finishing capacity and the Allegheny Steel Co. has put on some steel making units preparatory to starting up some sheet mills next week. The Carnegie Steel Co., on the other hand, is running at a lower rate this week than it did last week. There has been no change to speak of in the Valley and Wheeling districts. The monthly unfilled tonnage statement of the Steel Corporation showing an increase in its obligations of about 17,000 tons, occasions little surprise since December was the last month of the quarter and a

good many orders for rails and tin plate went upon its books during that month.

The pig iron market is showing a little more life, but actual business still is unsatisfactory as regards both volume and prices. Old material prices show considerable firmness in the lighter grades of open-hearth material. So many of the blast furnaces now active are protected against fuel requirements that there is practically no market whatever in prompt coke.

Pig Iron.—Inquiry for foundry iron is rather more active than it has been and sales reach a somewhat heavier total than before in several weeks. The National Radiator Co., which recently put out an inquiry for 1500 tons for shipment in equal quantities to its three plants, is understood to have closed for the 500 tons for its Johnstown works, at \$19.50 for No. 2 grade, at a western Pennsylvania furnace. A Pittsburgh foundry interest has taken 500 tons of No. 2 iron at \$19.50, Valley furnace. There is before sellers an inquiry for 2000 tons of foundry or malleable iron from a maker of fittings, while local concerns which are preparing to bid on a portion of the requirements for the new Manhattan tunnel are seeking protection on 5000 tons of foundry grade. There is also an inquiry for 500 tons of No. 2 foundry from a Pittsburgh melter. The common price both on in-

quiries for and sales of No. 2 foundry iron has been \$19.50 at furnace. It is reported, however, that Lake furnaces have gone as low as \$19, Valley furnace, on local business. The most interesting piece of business in steel making iron was a sale of 1500 tons of Bessemer to an Ohio ingot mold manufacturer at \$19.50, Valley furnace. This is a drop of 50c. per ton from the former nominal quotation on this grade. A Pittsburgh district sheet maker has inquired for 500 tons of basic for early delivery, against which the common quotation has been \$18.25, Valley furnace. Talk is heard of \$18 for Valley basic, but a sale at that price is yet to be reported. Follansbee Brothers Co. recently closed for 1000 tons of basic, the business going to a nearby maker at about \$19.75, delivered, Follansbee, West Virginia.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$18.25
Bessemer	19.50
Gray forge	\$19.00 to 19.50
No. 2 foundry	19.50 to 20.00
No. 3 foundry	19.00 to 19.50
Malleable	19.50 to 20.00

Ferroalloys.—Interest in the market on the part of consumers is extremely limited, and in the absence of important transactions, it is impossible to make any material change in prices. Makers of 50 per cent ferrosilicon still are quoting \$60 furnace, freight allowed, or more, but the effect of business done a few weeks ago at \$54 to \$55 still lingers and it is difficult to get consumers' ideas up to even \$60. The common quotation on 80 per cent ferromanganese is \$58.35, Atlantic seaboard, this price applying to domestic, English and German material. As far as this immediate district is concerned, that price is unobtainable since it means a delivered price of \$1 to \$2 per ton above the price of the Steel Corporation subsidiary making and offering this material. The inquiry for 300 tons of 15 to 19 per cent spiegelisen by a central Ohio steel maker, referred to in these columns a week ago, has been closed on a basis of \$24 furnace, or \$27.60 delivered. Interest in Bessemer ferrosilicon and silveries in this district is very limited. This is partly due to the fact that the steel foundries are getting a good deal of Government material in their scrap purchases, and his steel runs so high in silicon as to obviate the necessity of using the usual amount of high silicon iron.

We quote 78 to 82 per cent domestic ferromanganese at \$59 to \$63.67 delivered; 78 to 82 per cent foreign ferromanganese, \$58.35, c.i.f. Atlantic seaboard; German, for 76 to 80 per cent, \$54, seaboard. Average 20 per cent spiegelisen at \$30 delivered, Pittsburgh or Valleys; 16 to 18 per cent spiegelisen, \$26 to \$30 delivered Pittsburgh; 50 per cent ferrosilicon, domestic, \$54 to \$57, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$38.50; 11 per cent, \$41.80; 12 per cent, \$45.10; 13 per cent, \$49.10; 14 per cent, \$54.10; silvery iron, 6 per cent, \$27; 7 per cent, \$28; 8 per cent, \$29.50; 9 per cent, \$31.50; 10 per cent, \$33.50; 11 per cent, \$36; 12 per cent, \$38.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—The market still is a very narrow affair, with little business being placed and prices still rather indefinite. These conditions are in keeping with those existing in finished products. Mills which do not make their own steel are not heavily booked and the common impression is that the demand for sheets, plates and merchant mill products, for the next few months at least, will be much as it has been during the past few months, namely, the covering of actual needs. The common asking price on billets, sheet bars and slabs is \$30, but there is reason to suppose that that price can be shaded at least \$1 on sheet bars and that a sizable inquiry for 4-in. billets would develop a price as low as \$28.

We quote 4 x 4 in. soft Bessemer and open-hearth billets at \$28 to \$29; 2 x 2 in. billets, \$29 to \$30; Bessemer and open-hearth sheet bars, \$30; slabs, \$29 to \$30; forging billets, ordinary carbons, \$32 to \$33, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—There is a fairly good demand from wire manufacturers and some export business, but inquiries from other sources are few and small. The quotations of all makers is \$38 Pittsburgh or Youngstown, for the base size of soft rods, but this price refers only to retail lots, and on quantity tonnages \$36 to \$37 is the range. Prices are given on page 183.

Steel Skelp.—The usual quotation on steel pipe skelp is 1.50c., but there is hardly enough demand to provide a test of this price. On steel boiler tube skelp, most makers are quoting 1.65c.

Steel Rails.—No improvement is noted in the demand for light sections and prices are largely nominal. On rails rolled from new steel, makers generally are asking 1.60c. base, but find it almost impossible to obtain that figure because of rather keen competition for passing business, notably on the part of makers of re-rolled rails, who are said to have gone as low as 1.45c. mill, to obtain orders. Specifications against orders for standard rails are not especially heavy as yet.

We quote 25 to 45-lb. sections, rolled from new steel, 1.45c. to 1.50c. base; rolled from old rails, 1.50c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Wire Products.—The impression is so widespread that present prices will not be maintained, that buyers are extremely cautious, and the common report is that there is room for much improvement in business. Inventories hardly are more than half completed and this also is a factor in the lack of activity. It is too early for any considerable amount of business from the agricultural districts and until what is regarded as a deplorable financial situation among the farmers is corrected, there is not much hope of normal demands from this source. Manufacturers here reiterate that there is no shading of the Dec. 21 prices of \$2.50 base per keg for nails and \$2.25 base per 100 lb. on plain wire.

We quote wire nails at \$2.50 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Iron and Steel Bars.—Demand is exceedingly light and prices for that reason are untested and nominal. All makers are quoting both mild and carbon bars at 1.50c. On the latter, however, there is such sharp competition from re-rolled bars, which have gone as low as 1.35c., that it is rather difficult to effect sales at the full quotation. Activity also is lacking in iron bars. Bars made from pig iron are quoted at 4c. base, with those containing scrap ranging down to 2c.

We quote steel bars rolled from billets at 1.50c.; reinforcing bars, rolled from billets, 1.45c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.35c. to 1.40c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Sheets.—There has been no appreciable increase either in orders or specifications, probably because most consumers still have supplies on hand or due them at prices \$5 per ton below those now quoted, and which are being adhered to with remarkable tenacity. In the passing business, the American Sheet & Tin Plate Co. seems to be faring better than the independents, as is evident from the fact that it is operating more than 70 per cent of its mills, against a rate of only slightly more than 30 per cent by independent manufacturers. The effort to break prices has not ceased, but continues to be unsuccessful. It is commented upon that 2.25c. base has become fairly easy to obtain on the lighter gages of blue annealed sheets, but the heavier gages still are being sold on the plate base which, with the latter product at 1.50c., would mean slightly less than 2c. for heavy blue annealed stock. Prices are given on page 183.

Tin Plate.—The most important development of the past week is that there has been a considerable lessening in the tendency to shade the regular price of \$4.75 per base box on standard coke. This is probably explained by a little better distribution of the business than was the case recently, and fewer mills now feel the need of making concessions to secure orders. The movement of tin plate against orders is unusually good for this time of the year, and mill operations rarely have been as heavy at this season as they are this year. The American Sheet & Tin Plate Co. is operating more than 90 per cent, while among the independents full operations are noted by Standard Tin Plate Co., Canonsburg, and 80 per cent operations or better, by the Jones & Laughlin Steel Co. and Weirton Steel Co. The McKeesport Tin Plate Co., the Wheeling Steel & Iron Co. and the Washington Tin Plate Co. are idle, but the first named is expected

to resume operations next week and the Wheeling Steel & Iron Co. is making an effort to start up its Yorkville, Ohio, plant.

We quote standard production coke tin plate at \$4.75 per base box f.o.b. Pittsburgh for carload lots.

Cold-Finished Steel Bars and Shafting.—Business still is of very moderate proportions, and not especially well distributed. There is some buying of shafting by oil well supply houses, while the locomotive companies also are taking on fair sized tonnages and the demand from makers of motors has been better in the past few weeks than before in some time. The big outlets for screw stock, the automotive industry and the machine tool manufacturers, however, still are largely closed. The going price on the bulk of the business in cold-finished bars and shafting, is 2c. base, Pittsburgh, but sales have been made both below and above that figure. The full range of prices is from 1.85c. to 2.25c. base. Ground shafting is unchanged at \$2.50 base per 100-lb. f.o.b. Mill.

Hoops and Bands.—Prices still are very poorly defined and because of the uncertainty as to where they will ultimately land, business is extremely small. There is no question but that band steel can be bought as low as 1.75c., although the asking price of regular makers is 2c. That price also is quoted on hoops, but the \$10 per ton differential which that price means over the current price for steel bars, is proving something of an obstacle to business, since even adding 50 per cent to the pre-war differential to cover the increased cost of labor and handling charges still would leave the margin wide as compared with what it was before the war.

Hot-rolled and Cold-rolled Strips.—There has been little, if any, increase in actual business, but because of the common belief that stocks in consuming hands are pretty well liquidated, the outlook is considered good for the more active market in the next 45 or 60 days. The going price on hot-rolled strips is 2c. base, Pittsburgh, for carload lots, but there are intimations that large buyers, as usual, are getting some preferential price treatment. All makers now are down to a base of 3.50c. Pittsburgh, for cold-rolled strips, and there is no important shading of that price.

Nuts and Bolts.—Business with makers in this district shows no appreciable improvement and business in consuming industries is so slack that hopes of early improvement are not especially strong. Since present quotations fully discount present prices of raw material, there is not much disposition to shade them. It is not so much a question of price as of needs that hinders business. Discounts are given on page 183.

Rivets.—Recent reduction in prices by the leading Cleveland maker has been followed by makers in this district. Business is no better at the new quotations than it was at the old ones. Prices and discounts are given on page 183.

Spikes.—The market is showing a little more life on standard spikes than it did recently. The Norfolk & Western Railway recently closed with a Pittsburgh maker for 6000 kegs at around \$2.25 base, per 100 lb. while new inquiries include 2000 kegs for the Southern Pacific Co., and 1000 kegs for the Missouri Pacific Railroad. It is probable that Western mills will be awarded these orders. Small spikes are in light demand. Prices are unchanged, but the market is steady rather than firm. Prices are given on page 183.

Structural Material.—Fabricating interests in this district note some increase in inquiries, but actual awards are few and not much tonnage is involved. The Jones & Laughlin Steel Co. will furnish 700 or 800 tons of concrete bars for the Scottish Rite Cathedral, St. Louis, and also 400 tons of structural material for the new Langley School, Pittsburgh. Plain material is inactive, but fairly steady at 1.50c., Pittsburgh. Prices are given on page 183.

Plates.—Local mills are experiencing a very slow demand. Railroad equipment companies in this district do not seem to be faring nearly as well on orders as those in other parts of the country, and the recent

downward reaction in oil prices has put a quietus upon the demand for storage tanks.

We quote sheared plates, ¼ in. and heavier, tank quality, at 1.50c. f.o.b. Pittsburgh.

Iron and Steel Pipe.—The South reports building activity the coming spring and building projects in the New York district also point to some good sized future orders for merchant pipe from that center. The drop in oil prices, which now amounts to 75c. per barrel in Pennsylvania crude from the recent high point, is having its effect upon the demand for oil well pipe, but there are two promising inquiries for line pipe out of the natural gas field in Louisiana. One of these is for 400 miles and the other is for 250 miles. There is good observance of the Dec. 16 steel pipe card and the makers of wrought iron pipe are holding to their last card, dated Sept. 1, last year. Discounts are given on page 183.

Boiler Tubes.—Demand is steady rather than active. All makers of lap weld steel boiler tubes now are giving a supplementary discount of 5 per cent in addition to the regular card discount on carload lots. There has been no change in charcoal iron tubes. Discounts are given on page 183.

Coke and Coal.—The spot market in furnace coke has practically disappeared since all furnaces in this and nearby districts dependent on outside sources for fuel supplies now are covered by contract. As nearly as can be determined from the limited spot business in progress, the market is quotable at the recent range of \$2.75 to \$3 per net ton oven. Spot foundry coke is available at the usual premium of \$1 per ton over furnace grade. The 1921 production of Connellsville coke is estimated by the Connellsville *Courier* to have been 3,572,417 net tons, as compared with 10,738,227 tons, in 1920.

Steel Chain.—Effective Jan. 4, leading makers of steel chain issued a new price list reducing base price from \$5.90 to \$5.50 per 100-lb. There has been a slight revision on the size extras in the new card, that of 3/16-in. to ¼-in., having been increased 10c. per 100-lb.; on 5/16-in. to ¾-in. inclusive 15c. per 100-lb.; on 9/16-in. 25c. per 100-lb. and on 11/16-in. to 5/8-in. 10c. per 100-lb. The new list reduces the price on wagon chains from 25c. to \$1 per 100-lb. and the smaller sizes of loading chain have been cut \$2 per 100-lb. for ¼-in. and 9/16-in., and \$1 per 100-lb. for 5/16-in. There has been an increase in the discount on cold shuts, slip and grab hooks, all kinds of bright chain and cow ties of 5 per cent.

Old Material.—Recent sales of machine shop turnings have been at from \$9.50 to \$10; of shoveling turnings at \$10.75 to \$11 and the same price has been paid for cast iron borings. There is a pretty good market for compressed sheets at \$11.75 and for hand bundled sheets at \$1 per ton less.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Bracknridge, Monessen, Midland and Pittsburgh.....	\$14.50 to \$15.00
No. 1 cast, cupola size.....	16.25 to 16.75
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.	15.50 to 16.00
Compressed sheet steel.....	11.75 to 12.00
Bundled sheets, sides and ends.....	10.50 to 11.00
Railroad knuckles and couplers.....	15.00 to 15.50
Railroad coil and leaf springs.....	15.00 to 15.50
Low phosphorus standard bloom and billet ends	17.50 to 18.00
Low phosphorus plates and other grades	17.00 to 17.50
Railroad malleable	12.50 to 13.00
Iron car axles.....	24.00 to 25.00
Locomotive axles, steel.....	22.00 to 23.00
Steel car axles.....	18.00 to 18.50
Cast iron wheels.....	15.00 to 15.50
Rolled steel wheels.....	15.00 to 15.50
Machine shop turnings.....	9.50 to 10.00
Sheet bar crop ends.....	14.50 to 15.00
Heavy steel axle turnings.....	11.50 to 12.00
Short shoveling turnings.....	10.75 to 11.00
Heavy breakable cast.....	14.00 to 14.50
Stove plate	13.00 to 13.50
Cast iron borings.....	10.75 to 11.00
No. 1 railroad wrought.....	11.50 to 12.00

Chicago

CHICAGO, Jan. 9.

The placing of large orders for railroad cars and the probability of further important purchases within the next week or two have given the iron and steel market an undertone of confidence. Although actual bookings by mills and furnaces during the first week of the new year are not appreciably larger than those of the closing week of 1921, the car buying now under way is bound to put considerable tonnage on the books of producers. Another source of encouragement is the failure of the general strike of the local building trades unions to materialize. Scheduled for to-day, the walkout was prevented by a last-minute refusal of three crafts to follow the dictates of the Building Trades Council.

One discouraging recent development is the rumored discovery of salt water in the new Mexia, Tex., oil fields which has had the effect of halting negotiations on storage tanks now on inquiry. The report has not been verified, however, and it is hoped that it will prove to be merely a bear story. Demand for iron and steel from miscellaneous sources is still very light. The expectation that jobbers would replenish their stocks after the first of the year has not yet been fulfilled.

Mill operations in this district have declined. The Illinois Steel Co. has 10 active blast furnaces, or one less than a week ago, and is producing steel at the rate of 28½ per cent of ingot capacity. The Inland Steel Co. continues to operate two blast furnaces, but has reduced its steel output to a 35 to 40 per cent basis. It has eight open-hearth furnaces running and all of its sheet mills; its continuous merchant and 24-inch structural mills are active.

Pig Iron.—Buying is light and new inquiries are few. With few orders of size being placed, the price situation remains largely untested. That the market is none too steady, however, is evidenced by the fact that concessions have been made in competitive territory. For Indianapolis delivery, 350 tons of malleable was bought at a price which figures back to less than \$18.75, base Chicago furnace. In the Chicago district proper, \$19, base local furnace, appears to be the minimum. A number of carload sales of Southern foundry have been made at \$16.50 base, Birmingham, and it is said that \$16 could be done on tonnage. Little activity is reported in charcoal, low phosphorous or silvery. While Jackson County producers continue to adhere to \$29.50, furnace, for 8 per cent silvery, resale and electrolytic material is being offered for less.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging sil. 1.50, delivered at Chicago....	\$31.50
Northern coke, No. 1, sil. 2.25 to 2.75.	\$19.50 to 20.00
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	19.00 to 19.50
Northern high phos.....	19.00 to 19.50
Southern foundry, sil. 1.75 to 2.25..	23.17
Malleable, not over 2.25 sil.....	19.00 to 19.50
Basic.....	19.00 to 19.50
Low phos. Valley furnace, sil. 1. to 2 per cent copper free.....	33.00
Silvery, sil. 8 per cent.....	32.82 to 34.82

Ferroalloys.—A local melter has closed for 100 tons of 15 per cent ferrosilicon at slightly under \$38 delivered and for a carload of spiegeleisen at \$31.50 delivered. The spiegeleisen was brought from a furnace with a freight of \$6.50 and it is understood that this producer has now exhausted its stocks of that material.

We quote 78 to 82 per cent ferromanganese, \$66.75, delivered; 50 per cent ferrosilicon, \$60, delivered; spiegeleisen, 18 to 22 per cent, \$36 to \$37, delivered.

Railroad Equipment.—The Union Pacific has placed orders for 4500 cars as following: One thousand automobile cars to General American Car Co., 500 automobile cars to Standard Steel Car Co., 1000 box cars each to Mount Vernon Car Mfg. Co. and the American Car & Foundry Co.; and 1000 all-steel automobile cars to the Pullman Co. The same road is expected to

place orders for 2000 additional cars. The Illinois Central to-day placed orders for 2000 gondola cars distributed as follows: Five hundred 46-ft. cars to the American Car & Foundry Co., 700 41-ft. cars to Haskell & Barker Car Co., 400 41-ft. cars each to Western Steel Car & Foundry Co. and Standard Steel Car Co. The board of directors of the Burlington has authorized the purchase of 7300 freight cars and orders are expected to be placed in the near future. The Great Northern will probably take action on its car inquiry next week.

Rails and Track Supplies.—No new rail orders are reported in this territory and the Gary mill is temporarily idle. While this is not the season for purchases of track supplies by roads of this locality, some attractive orders are being closed by lines passing through the South. The Illinois Central has bought 500,000 iron tie plates and the Louisville & Nashville, which recently ordered 50,000 tons of rails, is now in the market for necessary angle bars, bolts and spikes.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.60c. to 1.65c. f.o.b. makers' mills. Standard railroad spikes, 2.15c. to 2.25c., Pittsburgh; track bolts with square nuts, 3.20c. to 3.25c., Pittsburgh; tie plates, steel and iron, 1.875c. to 2c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Bars.—Jobbers have bought in a moderate way during the past week and some reinforcing tonnage has been placed, but on the whole, demand for mild steel bars in unsatisfactory. Considerable reinforcing steel for road work in Iowa and Illinois has been placed for March delivery and more of this business is pending. Numerous building projects requiring reinforcing are being figured on, one of the largest being a structure in this city for the Continental Insurance Co. This calls for 1200 tons and the Leonard Construction Co., Chicago, prepared the plans and has the contract for the excavation work. Bids on the 5000 tons of reinforcing for the sedimentation and aeration tanks at the Jones Island Sewage Disposal plant, Milwaukee, will be taken on Feb. 3. Bids on the warehouse for the Belknap Hardware & Mfg. Co., Louisville, Ky., will be taken Jan. 30. Other pending business includes 800 tons for Minnesota road work, on which bids will be taken at St. Paul, and 350 tons for a grain elevator at Galveston, Tex. The Kansas City Bolt & Nut Co. has the contract for 1000 tons for a dam at Wichita Falls, Tex. The Jones & Laughlin Steel Co. has been awarded 250 tons for a Scottish Rite Cathedral at St. Louis. The Truscon Steel Co. has received an order for 100 tons for road work near Blue Island, Ill. Bar iron mills report bookings somewhat improved, although still far from satisfactory. Bar iron is generally quoted at a flat price of 1.60c., Chicago.

Mill prices are: Mild steel bars, 1.60c. to 1.70c., Chicago; common bar iron, 1.60c., Chicago; rail carbon, 1.65c., mill or Chicago.

Jobbers quote 2.53c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 2.38c. base. Hoops and bands, 3.18c.

Wire Products.—Jobbers are buying somewhat more freely, but demand is still light. The new prices are holding so far as finished products are concerned, but weakness has appeared in wire rods, \$37 a ton being a fairly common quotation while as low as \$35 a ton is said to have been named. For mill prices see finished iron and steel, f.o.b. Pittsburgh, page 183.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg. The mill quotation on plain material ranges from 1.60c. to 1.75c., Chicago. Jobbers quote 2.78c. for materials out of warehouse.

Sheets.—Demand from domestic sources remains light, but considerable export business has been taken. One local mill has booked 4600 tons for Japan within the past week. Prices are firm.

Mill quotations are 2c. for No. 28 black, 2.25c. for No. 19 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 39c. per 100 lb.

Jobbers quote: Chicago delivery out of stocks, No. 19 blue annealed, 2.25c.; No. 28 black, 2.15c.; No. 28 galvanized, 5.15c.

Plates.—While new bookings during the first week of the new year were disappointing, mills are encouraged because of the prospects of heavy car buying by the railroads. The Union Pacific has placed orders for 4500 freight cars and large purchases by the Burlington and Illinois Central will be made shortly. The reported appearance of salt water in the new Mexia, Tex., oil fields has had the effect of halting negotiations on storage tanks on inquiry. The price situation is substantially unchanged. It is probable that car builders participating in the Union Pacific order will be able to place their steel requirements at 1.50c., Chicago, or \$2 under the general market.

The ruling mill quotations range from 1.60c. to 1.70c., Chicago. Jobbers quote 2.63c. for plates out of stock.

Bolts and Nuts.—Buying is at a minimum and discounts are weak. For nominal mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 183.

Jobbers quote structural rivets, 3.43c.; boiler rivets, 3.53c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 and 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Co. is low bidder on 900 tons for Akron, Ohio, and the National Cast Iron Pipe Co. submitted the low figure on 80 tons for Woodward, Okla. Ellis, Kan., let 269 tons to a contractor, who will sublet. Chicago takes bids Jan. 17 on 1353 tons and Milwaukee is expected to issue an inquiry soon for a round tonnage of 54-in. pipe. The price situation is unchanged except that occasional shading is reported.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$47.10 to \$48.10; 6-in. and above, \$43.10 to \$44.10, class A and gas pipe, \$4 extra.

Old Material.—Except for moderate purchases of wrought by two local iron mills and a few orders for cast and malleable from foundries, there was no consumptive buying to speak of during the first week of 1922. Speculative buying by dealers has also dropped off. Prices remain practically stationary. Re-rolling rails have declined 50c., while No. 1 cast has advanced a similar amount, but otherwise no changes have been made. Railroad offerings include the Union Pacific, 3000 tons; the Wabash, 1000 tons; the Northern Pacific, 750 tons; and the Southern, 10,000 tons.

We quote delivery in consumers' yards Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.00 to \$16.50
Relaying rails	23.00 to 27.50
Cast iron car wheels	13.00 to 13.50
Rolled or forged steel car wheels	13.00 to 13.50
Steel rails, re-rolling	12.00 to 12.50
Steel rails, less than 3 ft.	12.50 to 13.00
Heavy melting steel	11.50 to 12.00
Frogs, switches and guards cut apart	11.50 to 12.00
Shoveling steel	11.00 to 11.50
Low phos. heavy melting steel	13.50 to 14.00
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	7.50 to 8.00
Axle turnings	8.50 to 9.00

Per Net Ton	
Iron angles and splice bars	14.00 to 14.50
Steel angle bars	10.50 to 11.00
Iron arch bars and transoms	15.00 to 15.50
Iron car axles	19.00 to 19.50
Steel car axles	12.50 to 13.00
No. 1 busheling	8.25 to 8.75
No. 2 busheling	6.00 to 6.50
Cut forge	10.25 to 10.75
Pipes and flues	7.00 to 7.50
No. 1 railroad wrought	10.50 to 11.00
No. 2 railroad wrought	10.00 to 10.50
Steel knuckles and couplers	11.50 to 12.00
Coil springs	12.50 to 13.00
No. 1 machinery cast	13.00 to 13.50
No. 1 railroad cast	12.50 to 13.00
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	3.50 to 4.00
Cast borings	5.50 to 6.00
Stove plate	12.00 to 12.50
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	11.50 to 12.00
Agricultural malleable	11.50 to 12.00

Structural Material.—With strikes breaking out again in the local building trades, the construction outlook in Chicago is none too bright. A strike called to-day by local craftsmen constitutes a repudiation of their agreement to abide by the Landis award of last September and gives the contractors an opportunity to introduce the open shop, which is regarded in many quarters as the only solution of an exceedingly unsatisfactory situation. Mill prices remain unchanged. Few

fabricating awards were made during the first week of the new year. Recent lettings include:

Cadillac Foundry Co., annealing foundry and service buildings, Cadillac, Mich., 301 tons, to Indiana Bridge Co.
Melrose, Wis., bridge, 276 tons, to Worden-Allen Co.
Chicago, Wilmington & Franklin Coal Co., coal tipples, West Frankfort, Ill., 166 tons, to unnamed fabricator.

Pending business includes:

Municipal auditorium and market house, Memphis, Tenn., 2169 tons of structural steel and 300 tons of reinforcing, James Alexander Construction Co., Memphis, low bidder on general contract.

The mill quotation on plain material ranges from 1.60c. to 1.70c., Chicago. Jobbers quote 2.63c. for plain material out of warehouse.

Warehouse Prices.—Local jobbers have made reductions of \$3 a ton on plates, shapes, bars, shafting and hoops and bands. The new prices are shown under the paragraphs covering plates, structural material and bars.

St. Louis

ST. LOUIS, Jan. 10.

Pig Iron.—The first week of the new year brought forth an improvement in the pig iron market in inquiries and sales. Stocks in hands of melters are said to be down to the point where they can do no more business unless they buy something, and when purchases are made these days there is keen interest on the part of melters to have shipment and delivery expedited. The biggest sale of the week was 500 tons of foundry to a radiator company; a Quincy, Ill., implement manufacturer bought 200 tons of foundry iron; a local melter bought 100 tons of 3.25 to 3.75 silicon, with small lots to local melters. A few scattering sales were made of charcoal iron. Inquiries are from a carload to 150 tons. One inquiry is reported for 50 tons of 50 per cent Bessemer ferrosilicon. The market on Northern iron is \$19, Chicago, although offers of considerable tonnage would bring forth a lower quotation, while Southern iron is at \$16.50, Birmingham.

We quote delivered consumers' yards, St. Louis, as follows having added to furnace prices \$2.88 freight and war tax from Chicago and \$5.91 from Birmingham.

Northern foundry, sil. 1.75 to 2.35	\$21.88
Northern malleable, sil. 1.75 to 2.25	21.88
Basic	21.88
Southern foundry, sil. 1.75 to 2.25	22.41

Finished Iron and Steel.—The only business of consequence for structural material placed for some time for use in St. Louis was 240 tons of reinforcing bars, which went to the Jones & Laughlin Steel Co., Pittsburgh, at a delivered price. The structural steel, 3000 tons, went to the American Bridge Co. last October. Word has been received here that the awarding of the contract for the Belknap Warehouse, a 14-story building at Louisville, Ky., has been postponed until the last of the month. The job involves about 800 tons of bars and 800 tons of structural steel. Graham, Anderson, Probst & White, Chicago, are the architects. Barnett, Haynes & Barnett, St. Louis, are architects for a hotel in Memphis, plans for which are completed, but work has been delayed because of business conditions. The tonnage is approximately 850. Nearly all structural work here is being held up until the wage scale is adjusted. Nothing of consequence has come from the railroads thus far in 1922. It is understood by steel men here that the Prairie Oil & Gas Co. is in the market for 18 55,000-bbl. steel storage tanks, involving about 2500 tons of plates. Warehouse prices on bars, plates, structural shapes, bands and hoops are off 0.15c. per lb.

For stock out of warehouse we quote: Soft steel bars, 2.62 $\frac{1}{2}$ c. per lb.; iron bars, 2.62 $\frac{1}{2}$ c.; structural shapes, 2.72 $\frac{1}{2}$ c.; tank plates, 2.72 $\frac{1}{2}$ c.; No. 10 blue annealed sheets, 3.47 $\frac{1}{2}$ c.; No. 28 black sheets, cold rolled, one pass, 4.16c.; cold drawn rounds, shafting and screw stock, 3.65c.; structural rivets, \$3.62 $\frac{1}{2}$ per 100 lb.; boiler rivets, \$3.62 $\frac{1}{2}$; tank rivets, 7/16 in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 65-5 per cent; small, 60 and 10 per cent; lag screws, 65-5 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—The biggest prospect in coke is an inquiry for 600 tons for January and February shipment to California. A few orders were received for carloads and up to 100 tons. The coke market began the year with

a little better tendency in the right direction; buyers seemed to think that the market has about reached the bottom. There has been a better movement of domestic coke as the result of colder weather. The market is at \$3.75 to \$4.50 for Connellsville coke, which price is being met by local by-product producers.

Old Material.—The market for old material is inactive as far as purchases by steel mills and rolling mills is concerned, but maintains a fairly firm tone because of the expectation of dealers that the steel mills shortly will increase operations and consequently consumption. Most of the yard dealers have laid down large tonnages of old material in anticipation of better business early this year, although consumers contend that the expected turn for the better has not yet arrived. Railroad offerings are light for a change, the only lists out being the Mobile & Ohio, 850 tons, and the Kansas City Southern, 100 tons.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton

Old iron rails.....	\$15.00 to \$15.50
Steel rails, rerolling.....	11.50 to 12.00
Steel rails, less than 3 ft.....	11.50 to 12.00
Relaying rails, standard section.....	23.00 to 28.00
Cast iron car wheels.....	14.00 to 14.50
No. 1 heavy railroad melting steel.....	10.50 to 11.00
No. 1 heavy shoveling steel.....	10.00 to 10.50
Ordinary shoveling steel.....	9.00 to 9.50
Frogs, switches and guards cut apart.....	10.50 to 11.00
Ordinary bundle sheet.....	4.50 to 5.00

Per Net Ton

Heavy axles and tire turnings.....	5.00 to 5.50
Iron angle bars.....	13.50 to 14.00
Steel angle bars.....	9.00 to 9.50
Iron car axles.....	18.00 to 18.50
Steel car axles.....	13.50 to 14.00
Wrought iron arch bars and transoms.....	13.00 to 13.50
No. 1 railroad wrought.....	9.50 to 10.00
No. 2 railroad wrought.....	8.50 to 9.00
Railroad springs.....	11.25 to 11.75
Steel couplers and knuckles.....	11.25 to 11.75
Locomotive tires, 42 in. and over, smooth inside.....	8.00 to 8.50
No. 1 dealers' forge.....	7.00 to 7.50
Cast iron borings.....	5.50 to 6.00
No. 1 bushelings.....	8.50 to 9.00
No. 1 boilers cut in sheets and rings.....	7.00 to 7.50
No. 1 railroad cast.....	13.00 to 13.50
Stove plate and light cast.....	11.50 to 12.00
Railroad malleable.....	9.50 to 10.00
Agricultural malleable.....	9.00 to 9.50
Pipes and flues.....	7.50 to 8.00
Heavy railroad sheet and tank.....	6.00 to 6.50
Light railroad sheet.....	4.50 to 5.00
Railroad grate bars.....	9.50 to 10.00
Machine shop turnings.....	4.50 to 5.00
Country mixed iron.....	6.50 to 7.00
Uncut railroad mixed.....	7.00 to 7.50
Horseshoes.....	9.50 to 10.00
Railroad brake shoes.....	9.00 to 9.50

Buffalo

BUFFALO, Jan. 9.

Pig Iron.—Exclusive of purchases by radiator interests, sales for the week were about 12,000 tons; the radiator purchases being part of current requirements of 7000 tons. One furnace has filled a portion of this order and the price was lower than \$20, the ruling quotation. Some encouragement is developing out of increased inquiry and while foundries generally are asking for small tonnages in each instance, the outlook is promising. On an Eastern inquiry for 2.75 to 3.25 silicon, a furnace quoted \$21, but was unsuccessful. The New York vehicular tunnel project is more actively interesting Buffalo furnaces and while the actual inquiry has not been issued, it is expected about the middle of February. No contracts have been made for delivery beyond first quarter. Furnace operation is virtually the same; the Donner Steel Co. has one furnace temporarily out of blast.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.....	\$20.00 to \$21.00
No. 2X foundry, 2.25 to 2.75 sil.....	19.50 to 20.50
No. 2 plain, 1.75 to 2.25 sil.....	19.00 to 20.00
Basic.....	20.00 to 21.00
Malleable.....	20.00 to 21.00
Lake Superior charcoal.....	\$1.75

Finished Iron and Steel.—While improvement in inquiry is felt by most of the selling agencies, it is not regarded in all instances as indicative of a more active demand; rather, it is reflective of a desire to get prices for purposes of computing inventories for tax statements. The leading rail interest has increased operation due to receipt of several orders in addition to the one large order entered several weeks ago. The Buffalo Steel Car Co. has started work on 1000 steel hopper

cars for the Buffalo, Rochester & Pittsburgh Railway. No large structural awards have developed, but a number of small tonnages are engaging the two largest fabricators; one has sufficient tonnage booked to warrant its present basis of operation to continue three months.

Warehouse Business.—Effective Jan. 6, prices on heavy lines were reduced to conform to present mill schedules. Some betterment in the volume of inquiry has appeared since the first of the new year, but it can hardly be said to be a material improvement as yet.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.65c.; plates, 2.65c.; plates, No. 8 gage, 3.50c.; soft steel bars and shapes, 2.55c.; hoops and bands, 3.15c.; blue annealed sheets, No. 10, 2.65c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.55c.

Coke.—The market has weakened to the point that best grades are obtainable at \$4.25 f.o.b. ovens. Heating coke is quoted at \$2.75 to \$3.00.

Old Material.—Youngstown and Eastern Pennsylvania buyers have asked for prices on turnings and borings but production is too light to bring forth any great response. Heavy melting steel production is light and with the exception of a few purchases of less than 500 tons by the two mills which have consistently bought, little has developed. The slightest interest in any old material would be quickly followed by a price advance.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel.....	\$13.00 to \$14.00
Low phos., 0.04 and under.....	17.00 to 18.00
No. 1 railroad wrought.....	15.00 to 16.00
Car wheels.....	16.50 to 17.50
Machine shop turnings.....	7.50 to 8.00
Cast iron borings.....	7.00 to 8.00
Heavy axle turnings.....	10.50 to 11.50
Grate bars.....	12.00 to 13.00
No. 1 busheling.....	10.00 to 11.00
Stove plate.....	15.00 to 16.00
Bundled sheet stampings.....	8.00 to 9.00
No. 1 machinery cast.....	17.00 to 18.00
Hydraulic compressed.....	10.50 to 11.50
Railroad malleable.....	18.00 to 19.00

Boston

BOSTON, Jan. 10.

Pig Iron.—Practically all makers of stove parts in this section of the country, as well as some of the heater and a large number of jobbing foundries, up to yesterday, have been closed for cleaning up stock and inventory purposes. Melters naturally have shown little disposition to purchase pig iron until their requirements are more clearly defined. Sales reported this week involve approximately 2000 tons, of which 1400 tons No. 2 plain eastern Pennsylvania, first quarter, was taken by a Bridgeport, Conn., maker of valves at private terms, delivery to be made by barge. Other transactions mostly were car lots, although a Massachusetts foundry took 100 tons Buffalo No. 2X at \$19.50 furnace and a Vermont melter 150 tons No. 2X eastern Pennsylvania at \$21.50 furnace. The last sale was fully 50c. above the lowest price quoted by any other furnace, the market for eastern Pennsylvania iron being \$20 to \$20.50 base in all but this one instance. Buffalo No. 2 plain and No. 2X continue available at \$19. There is not enough being done in Virginia and Alabama irons to establish a market. Most of the large users have covered their first quarter pig iron requirements, consequently furnaces will have to accept more extended datings to secure desirable tonnages. Local brokers report collections as slow.

We quote delivered at common New England points as follows, having added to furnace prices \$4.08 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.54 from Virginia and \$10.66 from Alabama:

East. Penn., silicon 2.25 to 2.75.....	\$24.96 to \$25.96
East. Penn., silicon 1.75 to 2.25.....	23.56 to 24.56
Buffalo, silicon 2.25 to 2.75.....	24.48 to 25.48
Buffalo, silicon 1.75 to 2.25.....	24.46 to 25.46
Virginia, silicon 2.25 to 2.75.....	25.91 to 26.91
Virginia, silicon 1.75 to 2.25.....	25.89 to 26.89
Alabama, silicon 2.25 to 2.75.....	25.91 to 26.91
Alabama, silicon 1.75 to 2.25.....	25.89 to 26.89

Finished Material.—Structural steel is the only finished material showing any degree of activity in this market. Since Jan. 1 a considerable aggregate tonnage of possibilities has developed, including 2000 tons for a new Boston hotel, 2400 to 2500 tons for the Chamber of Commerce, and numerous smaller amounts.

New England Structural Co. is awarded 1200 tons for a local bank addition, while a Providence, R. I., fabricator is awarded 350 tons for a textile mill and 300 tons for a dry goods store. Plain material is firm at 1.50c. or \$30 per net ton f.o.b. Pittsburgh. Buying of plates continues in small tonnages at 1.50c. and occasionally 1.55c. and 1.60c. The demand for bars is limited. The New York, Ontario & Western Railroad, a subsidiary of the New York, New Haven & Hartford Railroad Co., has placed an order for 30 all-steel cars with the Osgood-Bradley Car Co., Worcester, Mass., involving \$600,000. Local warehouses report some improvement in business since Jan. 1, but say consumption is far from active.

Jobbers now quote: Soft steel bars, \$2.71½ per 100 lb. base; flats, \$3.31½; concrete bars, \$2.20 to \$2.71½; tire steel, \$4 to \$4.40; spring steel, open hearth, \$4.50; crucible, \$11.50; steel bands, \$3.31½ to \$3.78; steel hoops, \$3.31½; toe calk steel, \$5; cold rolled steel, \$3.55 to \$4.05; structural steel, \$2.71½; plates, \$2.81½ to \$2.99; No. 10 blue annealed sheets, \$3.78; No. 28 black sheets, \$4.50; No. 28 galvanized sheets, \$5.50; refined iron, \$2.71½; best refined, \$4.25; Wayne iron, \$5.50; Norway iron, \$5.50 base.

Coke.—Little of interest has developed in the local by-product foundry coke market since a week ago, when both the New England Coal & Coke Co. and the Providence Gas Co. reduced their price from \$10.66 to \$10.40 delivered where the local freight does not exceed \$3.40. This reduction was based on values here being somewhat out of line with those quoted for Connellsville foundry cokes. Most of the large New England consumers of foundry coke have covered their first half requirements at price ruling date of shipment, consequently new bookings in each individual case involve small tonnages. The Providence Gas Co. is delivering foundry coke as fast as it is made, but the New England Coal & Coke Co. reports limited shipping instructions, with indications of a betterment by Jan. 15.

Old Material.—The strength of cast iron borings is the outstanding feature. Prices for same are easily \$1 higher, due to a scarcity of material and efforts by dealers to cover on old contracts. Otherwise little has developed since Jan. 1, except, perhaps, some shading of quotations on railroad and yard wrought, street car axles, shafting and car wheels, due to the lack of business rather than any pressure to sell. A Massachusetts manufacturer is offering a fair tonnage of shafting at 2¼c. Heavy melting steel, if anything, is firmer, in anticipation of better business before the close of the month by dealers. Two cars of special steel, grading better than ordinary lots of heavy melting, sold this week to a Massachusetts foundry at \$12 delivered. Some brokers are still endeavoring to secure \$19 delivered for No. 1 machinery cast, but New England foundries display little interest at that price inasmuch as they can secure all material necessary on a basis of \$17.50 to \$18.50 delivered, either in large or small tonnages.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery cast.....	\$17.50 to \$18.50
No. 2 machinery cast.....	15.50 to 18.50
Stove plate	15.00
Railroad malleable	13.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$8.00 to \$8.25
No. 1 railroad wrought.....	10.50 to 11.00
No. 1 yard wrought.....	9.50 to 10.00
Wrought pipe (1-in. in diam. over 2 ft. long).....	7.00 to 7.25
Machine shop turnings.....	3.50 to 4.00
Cast iron borings, rolling mill.....	7.00 to 7.50
Cast iron borings, chemical.....	7.50 to 8.00
Blast furnace borings and turnings.....	3.50 to 3.75
Forged scrap and bundled skeleton.....	4.50 to 5.00
Street car axles and shafting.....	10.50 to 11.00
Car wheels	11.50 to 12.00
Re-rolling rails	10.00 to 10.50

A technical session covering the subject of stokers, will be held Saturday evening, Feb. 4, at the Hotel Chatham, Pittsburgh, under the auspices of the Combustion Engineering Section of the Association of Iron and Steel Electrical Engineers. The following manufacturers have signified their intentions of participating in this discussion: American Engineering Co., Green Engineering Co., Combustion Engineering Co., James A. Brady Foundry Co., Underfeed Stoker Co. of America, Westinghouse Electric & Mfg. Co. and Sanford & Stoker Co.

New York

NEW YORK, Jan. 10.

Pig Iron.—Most of the purchasing done by the American Radiator Co. at Buffalo was for plants in that vicinity. It is understood that about 6000 tons was bought from one company. The purchases included 1000 tons of No. 2 plain and 500 tons of No. 3 for its Bayonne plant. The price is not announced, but it seems probable that it was under \$20, eastern Pennsylvania. Buffalo is reported selling at \$19 furnace for No. 2X. Some melters who did not buy at all last year are now buying moderate quantities. There is no disposition, however, to cover for requirements far into the future. Much interest is felt in the bidding on the segments for the vehicular tunnel between New York and New Jersey. As the delivery of the segments will cover about two years, it will be necessary to do some careful figuring and furnaces are cautious about committing themselves so far in advance.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25.....	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75.....	23.02 to 23.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25.....	22.52 to 23.02
Buffalo, sil. 1.75 to 2.25.....	24.46 to 24.96
No. 2 Virginia, sil. 1.75 to 2.25.....	27.16 to 28.16

Ferroalloys.—Buying of ferromanganese is limited to carload and small lots for immediate needs of consumers and several sales of both British and American alloy are reported as made by the leading steel maker on a basis of \$60, Pittsburgh, and by British representatives at \$58.35, seaboard. While some consumers have been inquiring for 100 to 200 tons in several cases, these have not resulted in purchases of anything more than small lots. The spiegeleisen market is more active and sales are reported of at least 250 tons with the 20 per cent alloy going at \$26, furnace, and the lower grades at proportionately lower prices or around \$25, furnace. There is no demand for manganese ore and quotations continue nominal. The same conditions rule in the 50 per cent ferrosilicon market as in the ferromanganese market. Consumers buying only to fill their immediate needs. There have been sales of several carload and small lots on a basis of \$55 to \$57 per ton, delivered. Imports of ferromanganese in November were only 270 tons as contrasted with 7091 tons in November, 1920. The total to Dec. 1, 1921, was 8818 tons as contrasted with 53,830 tons to Dec. 1, 1920. Imports of manganese ore in November were 8620 tons as against 74,477 tons in November, 1920. The total for the 11 months of last year was 386,454 tons as against 542,189 tons to Dec. 1, 1920. Of the imports last November 8600 tons came from Brazil.

Quotations are as follows:

Ferroalloys

Ferromanganese, domestic, delivered, per ton,	\$60.00 to \$63.00
Ferromanganese, British, seaboard, per ton	\$58.35
Spiegeleisen, 20 per cent, furnace, per ton.....	\$26.00
Ferrosilicon, 50 per cent, delivered, per ton,	\$55.00 to \$57.00
Ferrotungsten, per lb. of contained metal.....	40c. to 50c.
